PREFACE

TO

THE FIRST EDITION.

MANY years have elapsed since any work, having the objects of the present, was offered to the public.

The respectable publications of Postlethwaite and Beawes, although they cannot be called practical Dictionaries of Commerce, were well adapted to the periods at which they appeared: but since their last editions, the face of Commerce has undergone a total change; the views of mercantile men in Britain have been extended in a degree of which the ablest political speculators could not entertain the most remote idea; and, above all, the laws and customs relative to trade, given in former works, have long become obsolete, and their places have been supplied by others corresponding with the present policy of the various maritime nations.

It can scarcely be necessary to observe, that such a publication as the present must, in every point of view, prove a desideratum in a country which has latterly absorbed the trade of the world, and which may be denominated the source of all Commerce, and the focus of Arts and Manufactures. That such a country should so long have been without a work of this nature, has afforded matter of great surprise; and every Bookseller has heard daily complaints relative to so glaring a defect in our national literature.

Anxious to fill up the chasm, the Editor has turned his attention to the present undertaking; and by the aid of the best English publications; by the assistance he has derived from voluminous productions on the subject of Commerce, which have lately appeared in France, Germany, and Holland; by the acquisition of many original documents; and by a sedulous attention to the subject for upwards of half a century, he trusts that his intentions will not prove abortive: but, on the contrary, that he shall be found to have presented to the trading part of the community, an important body of practical commercial knowledge.

Whatever it is requisite for a man of business to become acquainted with, it has been the Editor's care to introduce into this work; and it will be found, on comparison, that this Dictionary contains at least TWO THOUSAND ARTICLES MORE THAN ANY SIMILAR

PRODUCTION, in the English, or any other language. In fact, though this work is presented to the world in the compact and portable shape of an octavo, yet it contains twice as much letter-press as Anderson's and Macpherson's *Annals of Commerce*, published in four volumes quarto; and far more than Postlethwaite's *Dictionary*, printed in a larger type, in two volumes folio! Speaking to commercial men, it may not be deemed indecorous for the Editor to mention, that this work, with all its advantages, is offered to the public, in 1810, for TWENTY-FIVE SHILLINGS; while the *Dictionary* just mentioned was published at FIVE GUINEAS, in 1760.

The foreign denominations of commodities which, it will be perceived, are annexed to each article in six and sometimes in eight languages, form an entirely new feature in a work of this nature, and the utility of such a nomenclature must be obvious to every reader.

Under the heads of Europe, Asia, Africa, and America, is introduced a methodised account of the commerce, manufactures, and, in some instances, of the politico-commercial regulations of the several governments.

In a word, nothing has been omitted which could tend to render this work useful in the counting-house, and of necessary reference to men of business, and to inquisitive persons in general. The Editor and Proprietor, who have spared neither labour nor expense in giving it every possible degree of perfection, flatter themselves that they shall meet with their recompense in the approbation and patronage of the Public; and they confess they shall in a certain degree be disappointed if, in due time, the work is not considered as deserving of a station in every counting-house and place of business in the British dominions.

As they cannot presume, notwithstanding all their anxiety, that so extensive a compilation can be without faults and errors of some kind; they earnestly invite their Readers to favour them with such communications as may render so important a work perfect in any future edition.

London,

January 1. 1810.

PREFACE

TO

THE SECOND EDITION.

IT would have been injustice to the original compilers of this work to have suppressed their own account of its design; it has therefore been thought right to insert their preface. The demand for a second edition conveys sufficient observation on the utility of the first.

The Proprietors, in offering this amended volume to the protection of the public, abstain from any idle professions: at the same time, they must be permitted, in justice to themselves, to observe, that they have sedulously attended to the suggestions of those who have thought the work worthy their criticism; that they have corrected such errors as the kindness of friends pointed out; made such emendations as the important alterations in our commercial relations rendered expedient; and supplied, to the best of their judgment, such deficiencies as had been discovered. The last-mentioned improvement has more particularly occurred in legal subjects; the anterior edition not having, it was conceived, treated of that branch of knowledge sufficiently to render to commercial persons the necessary instruction for the protection of their rights; for the avoiding of difficulties, and perhaps dangers; nor even for the common intercourse of society.

On a perusal of the work, it will be found that a prodigious number of new articles of information have been introduced, and that the old ones have been revised and corrected, at least so far as could be effected without an entire alteration of the system on which it was originally undertaken. With respect to the authorities cited, it may be proper to observe, that though the doctrine exhibited in each particular instance may be derived from a remote source of the highest reputation, references are invariably made, when practicable, to such established works as are likely to be in the possession of most readers. By way of illustration, on legal subjects, maxims which may have flowed from Littleton, or Coke, are offered on the more generally acceptable authority of Blackstone.

The greatest difficulty to be encountered arose from the determination to introduce an accession of information, without materially

augmenting the size of the volume. With what degree of judgment this design may be considered to have been accomplished, it is not for the Proprietors, or Editor, themselves to anticipate; but they offer their work to the Public, in the fullest confidence that such diversified instruction on the numerous subjects of almost daily general interest to the superior order of commercial persons, was never before presented in so compendious a form.

London,
March 30, 1819.

PREFACE

TO

THE THIRD EDITION.

THE comparatively short time which has elapsed since the publication of the second edition of this work, may be referred to as a convincing proof of its favourable progress in the public estimation. Since that period, various legislative enactments have been made, materially affecting our commercial interests, and some important cases, on points of law, have been determined, which are carefully introduced into the present edition. It only remains to add, that where the lapse of time and the course of events have affected the previous statements of the work, such corresponding alterations have been made as were necessary to complete the requisite information down to the present period.

London,
June, 1823.

A

DICTIONARY

OF

TRADE, COMMERCE,

AND

MANUFACTURES,

&c. &c.

A B A

A B A

A, IMPORTS the year, as A.D. *Anno Domini*, the year of our Lord.

A. A. among chemists, signifies an amalgama, or the operation of amalgamation.

A, ā, or ā ā, signifies an ana, or equal quantity of each different medicine prescribed in a recipe.

AAM, a liquid measure at Amsterdam, containing about 65 pounds weight.

ABACA, a kind of hemp or flax, made from the fibrous part of an Indian plantane, the white makes very fine cloth, but the gray is used for cordage and cables.

ABAF, or AFT, a sea phrase, for the stern or hinder part of a ship or vessel.

ABANDONMENT, in its primary signification, is the voluntary renunciation of any property, so as that it shall no longer be reckoned among the effects of the party renouncing. Its most ordinary application in commercial transactions is to marine insurances; it then signifies the exercise of a right, which the assured claims, to call upon underwriters or insurers to accept of what is saved, and to pay the full amount of the insurance as if a total loss had happened. It is a practice as ancient as insurance itself, but must be total, and not partial, or of any particular portion of the property insured. The insured has the right of election to abandon, or not; but if he do abandon, he must give notice in a reasonable time to the insurer, or he will be considered by law as having

waved his right, and can never after recover for a total loss. This right, however, is, after all, only a modified one, for it cannot be exercised unless the damage exceed half the value; or the voyage be absolutely lost, or not worth pursuing; or, further expense being necessary, the insurer refuse to pay it: for if neither the thing insured, nor the voyage be lost, and the damage do not amount to a moiety of the value, this right cannot be exercised. When the underwriter has discharged his insurance, and the abandonment is made, he stands in the place of the insured, and is entitled to all the advantages of that situation in case the ship or property be not lost, or be afterwards recovered. *Park.* 6. 9.; 1 *T. Rep.* 608.; 1 *Black. R.* 276.

ABAS, a weight used in Persia for pearls, of about 5½ grains avoirdupois weight.

ABASSI, a Persian silver coin, (of two mamoudis, or four chayas) worth about one shilling sterling; there are double and treble Abassis, which being liable to adulteration, the payments in the coin are made by weight, and not by the number of pieces.

ABAT CHAUVÉE, a sort of French wool of inferior quality.

ABATELEMENT, a term used by the French in the ports of the Levant depriving all French merchants of the right of carrying on any trade, who disavow their bargains, or refuse to pay their debts.

ABATEMENT, or **REBATE**, is a discount allowed for prompt payment; it is likewise allowed at the Custom-house on goods which have received damage by salt water, &c. being reported by the surveyor or land waiter on the back of the warrant.

These are, perhaps, the most ordinary applications of the term in commercial transactions, but it has many other significations in law.

Abatement of a freehold is where a person dies seized of an inheritance, and before the person entitled can enter, a stranger enters and obtains possession. This has been denominated *abatement*, but is a metaphorical application of the expression. 3 *Black. Com.* 168.

Abatement of a nuisance is a remedy allowed by the law to a party injured by any nuisance, to remove or *abate* it. The reason for allowing this summary method, whereby a person may take a remedy into his own hands, is because some injuries which injure or disturb a man's daily occupations, cannot wait the slow progress of the ordinary forms of law. However it is a remedy which, to be exercised safely, must be done with great discretion. 3 *Black. Com.* 5, 6.

Abatement among legatees is where a testator leaves pecuniary legacies, and the estate falls short to answer them, the legatees shall abate in proportion. 2 *Fonbl.* 369.

Abatement, Pleas of, are objections made by a defendant in a suit, whereby he alleges some matter to show, either that he ought not to be put upon his defence at all, or at least not in the manner and form exhibited in the suit of the plaintiff. These pleas are of too great variety, and too technical to be further treated of here. 3 *Black. Com.* 301.

Abatement by death. The demise of the sovereign for the time being, formerly caused an abatement of all suits between subjects, as well as all patents and commissions by royal authority; but the inconvenience arising from such discontinuance being a great grievance, a remedy was applied by statute, viz. by 1 *Edw.* 6. c. 7. much enlarged and extended by 1 *Anne*, c. 8.

The decease of the parties to a suit, or of either of them, may also occasion an *abatement* of such suit. When it will have that operation, and when it will not, is matter of technical distinction into which it is unnecessary to enter, but the reader is referred to stat. 8 & 9 *Wil.* 3. c. 11. and to *Black. Com.* by *Archbold*, in notes, v. 3. p. 302.

ABB, the yarn of a weaver's warp, is so called by the clothiers; they also say *Abbwol*, in the same sense.

ABELICEA, the name of a tree, growing principally in Crete; the wood of which is called *santalus adulterinus*, and pseudo-santalum, or *Bastard Sanders*.

ABEL-MUSK. See **MUSK SEED**.

ABIES, a species of **PINE**, *Marina*, sea-fir; the *SERTULARIA abietina*. The *Cupres-*

sus, a species of **ANTIPATHES** is by some writers denominated *Abies recta*. See **RESIN**.

ABOARD, in or on board a ship.

ABOU COUCHOU, a sort of woollen cloth manufactured in Languedoc, Provence, &c. &c. in France, and sent from Marseilles to the Levant.

ABRA, a Polish coin, value about 12½d. sterling; at Constantinople it passes for one fourth of an *Aslani*, and at Smyrna and Cairo it is current for the same value as a Dutch dollar.

ABROHANI, or **MALLEMOLE**, a fine Bengal muslin.

ABROTANOIDES, a kind of coral like southern wood, whence it takes its name, according to Clusius. It is found on rocks in the bottom of the sea.

ABSINTHIUM, see **WORMWOOD**.

ABUCCO, or **ABOCCO**, or **ABOCCHI**, a weight used in the kingdom of Pegu; it is equal to a pound and a half, and to four and a half ounces light weight of Venice. See **WEIGHTS**.

ABUKESB, a Dutch dollar so called by the Arabs, which is current among them; the impression of the lion being so very bad, that they take it for a dog, and so call it *Abukesb*, being a dog in their language.

ACACIA, (GER. *Acaciensafft*. FR. *Suc d'acacia*. IT. *Acacia*. SP. *Acacia verdadera*, o'de Levante. PORT. *Acacia*. LAT. *Acaciæ succus*.) Egyptian thorn, a species of *MIMOSA*, from which the Chinese make that yellow which we see bears washing in their silks and stuffs, and appears with so much elegance in their painting on paper. The flowers are gathered before they are fully opened, and put into an earthen vessel over a gentle heat, being stirred continually, until they are nearly dry and of a yellow colour: then to half a pound of the flowers, a sufficient quantity of rainwater is added, to hold the flowers incorporated together. It is then to be boiled until it becomes thick, when it must be strained. To the liquor they add half an ounce of common alum, and an ounce of calcined oyster shells reduced to a fine powder. All these are mixed together into a mass. An addition of a proportion of the ripe seeds to the flowers, renders the colour somewhat deeper. For making the deepest yellow, they add a small quantity of Brazil wood.

ACACIA Juice, (GER. *Acaciensafft*. FR. *Suc d'acacia*. IT. *Acacia*. SP. *Acacia verdadera*, o'de Levante. PORT. *Acacia*. LAT. *Acaciæ succus*.) is prepared by inspissating to a due consistence the juice of the unripe fruit of the *MIMOSA Nilotica*. It is brought from Egypt, wrapt in bladder, in masses of from four to eight ounces each. The best is outwardly of a deep brown colour; inwardly, of a reddish or yellowish brown. It soon softens in the mouth, and has a rough, not disagreeable, taste, which is followed by a sweetish relish. It is used as a

cooling, and mildly astringent and styptic medicine. The *German acacia* is frequently sold for it. This is the juice of unripe sloes. It may be distinguished from the true acacia chiefly by its colour, which is as black as that of Spanish liquorice; it is also harder and heavier, and of a sharp taste.

ACACIA Gum. See GUM Arabic.

ACCEPTANCE, } see BILLS OF
ACCEPTOR, } EXCHANGE.

ACCEPTILATION, remission of a debt by an acquittance from a creditor.

ACCESSARY is derived from the Latin word *accedo*, and signifies the addition of something inferior to that which is of superior importance. Thus, in law, it means a person who participates with the principal actor in an offence, as by advice, aid, concealment, or comfort. Those who advise a criminal act, or aid in its perpetration, are accessaries *before* the fact; those who conceal or comfort the offender, or subsequently participate in the fruits of the offence, are accessaries *after*. In the highest offence, viz. treason, by the law of England, all who consent in any way are principals. Also in cases criminal, but not capital, there are no accessaries, for all parties concerned *before* are in the situation of principals; and those who receive the offenders *after*, are under no penalty, except in the case of certain offences enacted by statute, wherein receivers are specially declared to be subject to the punishment of accessaries.

ACCOMMODATION, a friendly agreement or composition between persons at variance. *Accommodation bills*, or *notes*, are those for which no value has been given, and are usually made use of by distressed persons to raise money on, for the purpose of supporting their credit. (For the laws respecting this kind of bills and notes, see BILLS OF EXCHANGE.)

ACCOMPLICE. — Accomplice is used in colloquial language as synonymous with accessory; but in technical precision it has a very different signification. The term *Accessory* excludes the supposition of the person to whom it is applied being a principal, and indeed is placed, to a certain degree, in opposition to it; but being an accomplice presumes that sort of *direct* and *immediate* participation, which constitutes a co-principal. The distinction between the two was more precisely recognized in the practice of the Scotch, than in that of the English courts of justice; but in modern times several statutes passed by the legislature of the United Kingdom have adopted the word according to the construction put upon it by the former, and have not only holden out an engagement of indemnity, but in

some instances also a pecuniary reward, to accomplices who discover their co-principals so that they can be prosecuted to conviction.

4 *Black. Com.* 330.

ACCOUNT, or ACCOMPT, signifies in general all kinds of computations made arithmetically, viz. *Time*, by years, months, days, &c. *Distances*, by leagues, poles, perches, &c. *Weights*, by tons, hundreds, quarters, pounds, ounces, &c. *Long measure*, by rods, ells, yards, &c. *Liquid measure*, by tuns, pipes, hogsheads, barrels, &c. *Dry measure*, by quarters, bushels, pecks, &c. *Money*, by pounds, shillings, pence, &c. &c. Monies of account are an imaginary species, used in different countries in order to facilitate the keeping of *accounts*, as pounds, &c. in England, Millreas in Portugal, &c. &c. &c.

Books of account are so universally known that it is useless here to describe them, more than to state that the principal ones are the waste book, journal, ledger, bill book, cash book, invoice and sale book, &c. &c. In keeping accounts the Italian method of *double entry* has very justly obtained the preference, as thereby it is next to impossible to commit error, provided the balance at the end of the year agree; as for every debtor (either *real* or *imaginary*) there must be a creditor in like manner.

In books of account the *real* debtor is understood to be the person or persons to whom goods are sold, and the *real* creditor to be the persons of whom money, &c. &c. is received in payment, and the *imaginary* accounts are such as *Profit and Loss*, *Commission Account*, *Charges Account*, &c. &c.

Accounts current are usually furnished by merchants to each other at least once a year, in which their entire transactions are stated, a balance struck, and when such balance is found free from error, it is carried either to the debit or credit of a *new account*, according as the balance may be at the time of finishing it, and so commences their new transactions; and this account, like all others, is closed with the exception of *errors* or *omissions*.

Account of *sales* is an account given by a merchant or factor to his principal for goods or merchandize consigned to him for sale, stating the sales made of such, with the purchasers' names, the prices or rate at which they sold, and therefrom are deducted all charges of freight, carriage, insurance, &c. as also the commission for selling, which being done, the remainder is called the *net proceeds*, the amount of which is carried or transferred to the consignee's credit in account current, viz. The following may serve as sufficient examples:

Sales, charges, and net proceeds of 500 tierces Ox mess beef, received per the Common John Thompson, master, from Cork, sold for account of George Goold, Esq. of the said city.

GEO. WEBSTER & SONS.

LONDON, 20th April, 1818.

An account of *interest* is where there are mutual dealings, and on which an account current exists; here there is a debit and credit for the interest of money *paid and received* and a balance struck, which balance is either

brought to the debit or credit of the person's account, as it turns out on closing the interest account; it is usually called an *interest account*, and is calculated from the debit and credit side of the account current.

ACCOUNTANT, or **ACCOMPTANT**, is a book-keeper or person conversant with accounts. It is also applicable to persons in the public offices, &c. as the *accountant* of the Bank, of the South Sea, or India Company, Custom-House, Excise, the Accountant General, &c. Of the last-mentioned officer it is necessary to give some particulars, as he is a person in whose official responsibility and duties, so large a portion of society is interested. He is an officer of the Court of Chancery, appointed to receive, and account for, all monies belonging to the suitors of that court; which monies he is to invest in the public funds in trust for the parties interested, till disposed of by order of the court. The Bank is answerable for the monies so deposited by this officer. He is prohibited from taking any fees for his labour, on pain of being punished for extortion, but is paid a certain allowance. 12 Geo. 1. c. 32. Counterfeiting the hand-writing of the Accountant General is felony, *sans* clergy, by the same statute.

ACCOUNTING-HOUSE, or **COUNTING-HOUSE**, a place set apart by merchants and traders to transact their business in, and where their books and all vouchers relative to their business are deposited.

ACETABULUM, a Roman liquid measure, equal to one-eighth of an English pint.

In *Botany*, the name of a species of the peziza, a genus belonging to the cryptogamia fungi of Linnæus.

In *Anatomy*, the cavity in the bones of the pelvis, which receives the head of the thigh bone.

ACETOSA, or **ACETOSELLA**, sorrel; the juice of sorrel is sometimes used as an agreeable refrigerant drink in fevers. The concrete acid, *oxalic acid*, usually sold under the name of *salt of lemons* is used in some of the arts. See **ACID**, *Oxalic*.

ACHIA, or **ACHIAR**, a sort of cane that grows in the East Indies, is pickled green in the country, with vinegar, pepper, and other spices, and sent home to Europe in stone or earthen jars; the colour is pale yellow, but resembles our cucumbers: this article is of great consumption in Holland.

ACHIOTTE, a drug used in dyeing, so called by the Brazilians; it is commonly called *Rocou*. See **ROCOU**.

ACHTELING, a German liquid measure, 32 of which make one heemer, and four schiltems make one Achting. See **WEIGHTS**.

ACHTENDEELEN, a Dutch corn measure, equal to about 536lb. avoirdupois weight.

ACIDS; those substances which impress the organs of taste with a sharp, sour, and cooling sensation, are in common language denominated *acids*. The characteristic properties of acids are the following:

1. When taken into the mouth they occasion a sour taste.

2. They change certain vegetable blue colours to red, such as tincture of litmus, or syrup of violets; and restore the blue colours which have been turned green, or the red colours which have been turned blue by an alkali. The old chemists divided acids into mineral, vegetable, and animal, according to their supposed origin. This, however, is not only an inconvenient, but an incorrect method of arrangement, as many of these bodies are found in all the three natural kingdoms. Acids have been generally considered as combinations of oxygen with some other substance, termed their radical or base; and it has been proposed to divide them into classes, as composed of one, two, three, or more radicals; and those of which the radicals are at present unknown. We shall describe them in this order.

Sulphuric Acid is a combination of oxygen and sulphur; and is obtained by burning sulphur with a proportion of nitre, in a close chamber lined with lead. The floor of the chamber is covered with water, to absorb the acid gas as it is formed, which solution is afterwards concentrated by boiling. That usually exposed for sale is of a specific gravity, about 1.845. When good, it is nearly devoid of colour and smell. It has an oily appearance, and thence is commonly called *oil of vitriol*. Sulphuric acid is much used by dyers and calico-printers, but is not often employed in other arts.

Nitric Acid is composed of oxygen, and a peculiar substance termed nitrogen, or azote. It is obtained by decomposing nitre by means of sulphuric acid. It is clear, and nearly colourless; has a pungent smell, and a strong acid taste, even when largely diluted with water. The acid of commerce, termed *nitrous acid*, is the same with the above, only that it contains a greater proportion of nitrogen. It is of a citron colour, and gives out red fumes on being exposed to the air. This is a very important article to the artizan: diluted with an equal proportion of water, it forms what is commonly called *aqua-fortis*, which is much used by dyers; particularly for dissolving tin: this solution heightens, and fixes many colours, especially that of cochineal. It is also used by brass-founders, silver-refiners, gilders, leather-dyers, and calico-printers. Two parts of nitric acid, and one of muriatic acid, constitute *aqua-regia*, the liquid employed for dissolving gold, and is consequently of important use to gilders and gold refiners.

Muriatic Acid (this is treated of in this place from its similarity, in many respects, to the acids we have described, and from the uses to which they are applied being to a certain extent similar, although it is one of those of which the base is not known), is composed of an unknown base, hydrogen, and, perhaps, oxygen. It is usually obtained by decomposing muriate of soda

(common sea salt) with sulphuric acid. It is colourless, has a penetrative, suffocating smell, and gives out white fumes on exposure to the atmosphere. It is much employed in the arts, more particularly in combination with alkalis, when it forms neutral salts. The most important use to which it is applied, is that of *bleaching*, when it is in the state usually termed *oxymuriatic acid*. It has also been employed for fumigating the dwellings of persons sick of fevers, and pestilential disorders, for the purpose of purifying the air.

Carbonic Acid. This acid cannot be obtained pure, but in the state of gas. It was formerly called fixed air; but from being composed of carbon and oxygen, the above term has been more properly applied to it. It is contained in considerable proportions in chalk, lime-stone, and magnesia, and is copiously disengaged from fermenting vegetable substances, and naturally from many parts of the earth; as from beneath the lake *Averno* in Italy, and the *Grotto del Cane*. Many springs are also impregnated with it; as those of *Spa*, *Seltzer*, and *Pymont*. Water may be made to absorb, by pressure, three times its bulk of carbonic acid gas. This mixture has a bright sparkling appearance, and a slightly acidulous refreshing taste.

Phosphoric Acid is a compound of oxygen and phosphorus, and is obtained by burning the latter substance in the open air. When first obtained, it is in the form of white snowy flocks, which, after a short time, attracts a sufficiency of moisture from the atmosphere to change them into a liquid state. This solution is colourless, has a strong acid taste, and a pungent smell. It is not employed in the arts.

Fluoric Acid may be obtained from the substance termed fluor spar, which is a combination of fluorine acid and lime. It is composed of hydrogen, and a base termed fluorine, respecting the nature of which little is known. Fluor acid, in the state of gas, is invisible; water rapidly absorbs it, and forms liquid fluoric acid. It has an acid taste, and the peculiar property of corroding silica, whence it has been employed for etching on glass. It is also used for depriving glass of its polish, and in some degree of its transparency.

Boracic Acid. This acid is obtained from the mineral salt termed borax. It is in the form of small flakes, slightly acid, and unalterable in the air. It has not been applied, when in a pure state, to any of the arts.

Arsenic Acid is a combination of arsenic and oxygen. It is in the form of a heavy, thick, incrustable mass, of an acid taste, soluble in hot water. It is not used in the arts.

Tungstic Acid is in the form of a tasteless yellow powder. It is composed of oxygen

and tungsten, and is found native in wolfram and some other minerals. It dissolves several of the metals, and assumes a blue colour in proportion as it abandons its oxygen.

Molybdic Acid. This acid is composed of oxygen and molybdenum. It is in the form of a pale yellow powder, and requires a large quantity of water for its solution.

Chromic Acid is an orange-coloured powder, composed of oxygen and chromium; it has an acrid metallic taste, is soluble in water, and crystallizable. Combined with different saline substances, it forms a variety of beautiful colours, which promise to be of great use to the painter and enameller.

Acetic Acid, or the pure acid of vinegar, may be obtained by decomposing acetate of copper, or acetate of soda or potash, by sulphuric acid. A thousand parts of acetate of copper (distilled verdigris) will furnish 486 parts of pure acetic acid. In its general properties, acetic acid is very similar to acetous acid, which we shall presently describe, but differs from it in the following respects. The active qualities of this acid make it nearly resemble some of the mineral acids; it is corrosive and intensely acid to the taste; it exhales a pungent odour, and is free from the spirituous flavour of distilled vinegar. It dissolves copper and some other metals; and it is capable of partly decomposing alcohol, forming acetic ether. It is used by chemists, and occasionally in medicine, as a stimulant to the nostrils in fainting fits; for this purpose, some acetate of potash is put into a bottle, and a little sulphuric acid poured upon it.

Acetous Acid, usually termed distilled vinegar, may be obtained from common vinegar by distillation, and also from nearly all saccharine liquors which have gone into acetous fermentation. It may also be acquired from wood by distillation; in this state it is usually termed *pyro-ligneous acid*. Acetous acid is a transparent colourless fluid; its specific gravity 1.0095, nearly as volatile as water; exhaling a pungent, fragrant odour; its taste is sharply acid and agreeable. Its component parts are oxygen, hydrogen, and carbon. Its uses are the same as those of vinegar, only that it is more powerful.

Oxalic Acid is found in a large proportion in the juice of sorrel, in combination with potash, from which it may readily be separated by a chemical process. It is in the form of crystals, of a very acid taste, soluble in water. This acid may also be obtained from sugar; whence it has sometimes been called *acid of sugar*. It is used by calico-printers, either pure or in the form of super-oxalate of potash, instead of citric acid; but the pure oxalic acid is apt to leave a stain on the linen, and the super-oxalate of potash is not sufficiently soluble in water to render the solution of a sufficient strength for many

purposes. Oxalic acid is usually sold under the name of salt of lemons, for removing ink-spots from linen, &c.

Tartaric Acid is obtained from the tartar of commerce; it is crystallizable, soluble in water, and of a pleasant acid taste. It is used in medicine, and by calico-printers to discharge false prints.

Citric Acid is obtained from the juice of lemons. It crystallizes in rhomboidal crystals, extremely acid to the taste, and readily soluble in water. It is used in medicine, for domestic purposes, and by calico-printers.

Malic Acid, as the name imports, is obtained from the juice of apples. It is in the form of an acid, reddish-coloured liquid, which is incrySTALLIZABLE. It has not been applied to any use except as a chemical test.

Lactic Acid is obtained from milk after the curd has been separated. It is of a yellow colour, incapable of crystallization, and has not hitherto been applied to any use.

Gallic Acid is found in the nut-galls of commerce, and various other astringent substances; and it is on this which depends the power of giving a black colour to the solutions of iron. It is in the form of thin, transparent plates, and in minute needle-shaped crystals of an acid austere taste.

Mucous Acid, or saccholactic acid, may be obtained from gum arabic and other mucilaginous substances, by treating them with nitric acid. It is in the form of a white gritty powder, with a slightly acid taste.

Benzoic Acid is contained in the gum-resin of that name. It is in the form of a light, white, flocculent powder, of a peculiar aromatic odour. Its taste is acrid and bitter. It is soluble in boiling water. It is only used in medicine.

Succinic Acid is prepared from amber. It is in the form of shining white crystals, of a slightly acid taste. It is used in medicine, and as a re-agent, but is not otherwise employed in the arts.

Camphoric Acid may be obtained by treating camphor with nitric acid. It is in very white crystals, of a slightly acid bitter taste, and a smell somewhat resembling that of saffron. It has not been used in the arts.

Suberic Acid is produced from cork by means of nitric acid. Its taste is acid, and is generally in the state of powder; it is not crystallizable. Hitherto it has not been applied to any use.

Laccic Acid. This acid is procured from white lac. It is a reddish fluid, of a bitter saltish taste. It crystallizes in needle-shaped crystals.

Prussic Acid is composed of hydrogen, nitrogen, and carbon. It is in form of a colourless liquid, of a sweet taste, and does not alter the colour of vegetable blues. It is usually obtained from prussian blue, by distillation with sulphuric acid. Its principal use is as a chemical test. Lately it has been

employed as a medicine to lessen the vital powers of the system.

Sebacic Acid is obtained from animal fat. It has the form of a liquid, of an acid, sharp, bitterish taste; and when mixed with nitric acid, will dissolve gold.

ACORI, or BLUE CORAL; it is fished up, on the coast of Africa, from *Rio-del-re* to the river of the *Camarones*, where the Dutch traffic for it: the coral of the kingdom of Benin is remarkably fine, it grows in the form of a tree, upon a rocky bottom. See **CORAL**.

ACORNS, (GER. *Eicheln, Eckern*. DU. *Akers*. DA. *Agern*. SW. *Ollon*. FR. *Glands*. IT. *Ghiande*. SP. *Bellotas*. PORT. *Bolotas*. LANDEAS. RUS. *Schedudii*. POL. *Zoladzy*. LAT. *Glandes*;) the seed or fruit of the oak. They are a powerful astringent, and were formerly used medicinally in decoction: They are now only applied to the feeding of swine and poultry, and for this purpose they are superior to almost every other species of food.

ACQUIT, a discharge or release in the united kingdoms of Great Britain and Ireland; but in France it is a sort of permit for goods sent from one place to another, in which are specified the marks and numbers, &c. of the packages, and also the limited number of days for their transit. In bills of exchange the word signifies *paid or discharged*.

ACQUITTANCE, a release or discharge of a debt *in writing*; some are made in presence of a public notary, and *in law* they should be a deed sealed. 3 Salk. 298. pl. 2. An acquittance or receipt in full of all demands will discharge all debts, except such as are on specialty, viz. bonds, bills, and other instruments sealed and delivered, which can only be destroyed by some other specialty of equal force, such as a general release, &c. 2 Cro. 650.

ACRE of land is 4 square rods, a rood 40 perches or poles: a Welch acre is double.

ACRE, or LACRE, this word is used in the dominions of the Mogul, and is a corruption of the word *Lac*; in his revenues it signifies 100,000 rupees of about 2s. 6d. sterling; 100 lacks of rupees make a *crore* in Indostan, or 10,000,000 rupees. The pound sterling is about 8 rupees, consequently a *lack of rupees* amounts to £12,500 sterling. The rupees of Surat and Bengal are worth about 30 sous of Holland, or 3 francs of France. See **MONIES**.

ACT OF HONOUR, is usually drawn up by a notary public, for the security of a *third person* who interferes for a friend abroad, in preventing his bill from being returned or dishonoured, for want of regular acceptance, or payment by the party on whom it is drawn, and is often done for endorsers on such disgraced bills, which not only prevents the heavy expences of re-exchange, but likewise preserves the credit of

such parties; it is therefore necessary for the safety of the merchant, to have an act of honour annexed to the report of such bills whereby he holds all parties legally bound to him for reimbursement, the act of honour is, viz. "Afterwards on the same day, month, and year, before me, the said notary and witnesses personally came and appeared, with Mr. A. B., of this city, merchant, who declared he was ready, and would accept the said bill of exchange, now under protest for the honour and account of Mr. C. D. the drawer (*as the case may be*), holding him the said drawer thereof, and all others concerned, always obliged to him the said appearer for reimbursement in due form of law." See **BILLS OF EXCHANGE**.

ACTION. An action signifies, in law, "a legal demand of a man's right." The person so demanding is denominated "*Plaintiff*;" and the person against whom the demand is made, "*Defendant*." Civil actions are divided into three kinds, viz. *real*, *personal*, and *mixed*. *Real* actions are such as respect land. *Personal*, such as relate to some personal debt, duty, or recompence. *Mixed*, are when the cause of complaint partakes of both some real and some personal demand, as where a man seeks to recover land, and also a recompence for damage done to that land. 3 *Black. Com.* 118.

The forms of actions are as various as the descriptions of grievances to be redressed; but the limits, to which a book of this kind must necessarily be restricted, do not admit of a technical specification of them.

ACTS OF PARLIAMENT. See **STATUTES OF THE REALM**.

ADAMANT, an ancient name for the diamond. It is also used for a very hard species of iron, and for the magnet or load-stone.

ADAMANTINE SPAR. (*spath adamantina*, *corundrum*, *nella corvindum*, *tella corvindum*, *corone*.) a stone found in India and China; crystallized, or in a mass. The Indian is the best. Its colour is grey, with shades of green and light brown; its fracture is foliated and sparry, sometimes vitreous. It is brittle, and of such hardness as to cut rock crystal and most of the gems. Specific gravity from 3.950 to 3.959. The Chinese variety differs from the Indian in containing grains of magnetic iron ore disseminated through it; in being generally of a darker colour, and having externally a chatoyant lustre: its specific gravity is greater, and its hardness somewhat inferior. There are two varieties known of corundrum in mass. That from Bengal is of a purplish hue: specific gravity 3.876. It is called by the natives *corone*. That from the coast of Coromandel is a foliated texture, and seems to be confusedly crystallized: its specific gravity is 2.785. This stone is employed for polishing gems,

ADARME, a weight used at Buenos

Ayres, and in other parts of Spanish America, and is one-sixteenth part of an ounce Troy weight, which is to that of Madrid, as 100 is to 93.

ADATIS, a fine Bengal muslin, 15 yards to the piece.

ADDITION is the art of joining one thing to another, or of augmenting a thing by the accession of others.

In Arithmetic it is the first of the four fundamental rules, and consists in finding the amount of several numbers or quantities severally added to one another. The number when found is called the "*sum*, or *aggregate*."

In law it signifies the title given to a man, beside his Christian and surnames, descriptive of his estate, degree, trade, or the like. For example, yeoman, gentleman, and esquire, are additions of estate; knight, baronet, earl, marquis, and duke, and such like titles of honor, are additions of degree; carpenter, butcher, clothier, merchant, are additions of trade. In legal proceedings these additions, applied as respectively due, are always necessary, that one man may not be molested in mistake for another. 1 *Black. Com.* 403. In suits or actions which may be prosecuted to outlawry, they are prescribed to be used by stat. 1 Hen. 5. c. 5.

ADELE, an Egyptian weight, used principally for rice, consisting of 210 okes, each of three rotolos, a weight of about two drachms less than an English pound. The adele varies in different parts of Egypt; at Rosetto it is only 150 okes.

ADENOS, a kind of cotton, otherwise called *marine cotton*. It comes from Aleppo by the way of Marseilles.

ADIPOCIRE, a soft, ductile, greyish-white matter, apparently intermediate between fat and wax, formed by a peculiar decomposition of dead animal bodies. Great quantities of this matter were found on opening the cemeteries of the *Innocents* burial-ground at Paris in the years 1796 and 1787. According to the testimony of grave-diggers, this conversion of animal matter is never observed in those bodies that are interred singly, but it always takes place in the common vaults (*fosses communes*). To effect this change nearly three years are required. Animal matter having passed into this state, appears to resist for a long time any further alteration; some of the pits that had been closed above 40 years were found to be filled with little else than a solid mass of *adipocire*. Its component parts are water, ammonia, and a concrete oil; in fact, an ammoniacal soap. A piece of flesh inclosed in a box having several holes in its sides, and placed in a running stream, will be changed into this substance in a month or two: a similar conclusion takes place by macerating it in very diluted nitrous acid.

ADIT, in a general sense, the passage

no, or entrance of, any thing. It is mostly used as applied to *mines*, where it signifies the hole or aperture whereby they are entered and dug, and by which the water and ores are carried away. The adit is usually made on the side and near the bottom of a hill, about four, five, or six feet high, and eight wide, in the form of an arch; sometimes cut in the rock and sometimes supported with timber, so constructed that the sole or bottom of the adit may answer to the bottom of the shaft, only somewhat lower, that the water may have a sufficient current to pass away without the use of the pump. Damps and the impurity of the air are the great impediments against driving adits above 20 or 30 fathoms, by reason of the necessity, in this case, of letting down air-shafts from the clay to meet the adit. The best remedy against this is that practised in the coal mines near Liege, where they work their adits without shafts; the manner of which is described by Sir James Moray. (*Phil. Trans.* vol. i. p. 79.)

ADJUSTMENT, is an expression used in settling averages on losses or policies of insurance on ships or merchandize, and when the underwriters sign such *adjustment* it is considered as finally settled. At foot of the policy it runs thus: "Adjusted a loss on this policy of ninety pounds seven shillings and sixpence per cent. payable in one month. London, 20th April, 1818." After such adjustment is signed by the underwriter, it is considered as a promissory note between him and the assured, and cannot be afterwards disputed.

ADMEASUREMENT. By the 6 G. 1. c. 21. sect. 53. the tonnage of ships inwards is to be measured thus: Take the length of the keel within board (so much as she treads on the ground) and the breadth within board, by the midship beam from plank to plank, and half the breadth for the depth; then multiply the length by the breadth, and that product by the depth, and divide the whole by 94, the quotient will give the true contents of the tonnage.

ADMINISTRATION, in general, is the management or direction of affairs.

ADMINISTRATOR, in law, he to whom the ordinary commits the administration of the goods of a person deceased in default of an executor. An action lies for or against an administrator, as for or against an executor; and he shall be accountable to the value of the goods of the deceased, and no farther: unless there be waste or other abuse chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration. If a stranger who is neither administrator nor executor take the goods of the deceased, and administer, he shall be charged, and sued as an executor, not as an administrator. The origin of administrators is derived from the civil laws.

ADMINISTRATRIX, is a woman who administers.

ADMIRAL, a great officer who has the command of the navy, and the hearing of all maritime causes; the term is also used for the commander in chief of a single fleet or squadron. It is also applied to all flag-officers in general; an admiral carries his flag at the main top mast head.

Vice admiral, is the commander of the second squadron, and carries his flag at the fore topmast head.

Rear admiral, is the commander of the third squadron, and carries his flag at the mizen topmast head. The rank of an admiral and his station in the line are also indicated by the colour of his flag. Hence there are admirals, vice admirals, and rear admirals of the white, of the blue, &c. &c.

ADMIRAL, is also an appellation given to the most considerable ship of a fleet of merchantmen, or of the vessels employed in the cod fishery of Newfoundland; he possesses privileges as long as the fishing season continues, and carries a flag on his mainmast.

ADMIRALTY, properly signifies the offices of lord high admiral, whether discharged by one single person, or by joint commissioners called *Lords of the Admiralty*. Theirs is a sovereign court, where cognizance is taken in all maritime affairs, whether civil or criminal; all crimes committed on the high seas, or on great rivers below the first bridge next the sea, are cognizable in this court only, and before which they must be tried by judge and jury; but in civil cases the mode is different, the decisions being all made according to the civil law. Appeals from the vice-admiralty court, in our plantations and settlements, may be brought before the courts of admiralty in England, but they may also be brought before the king in council. But in case of prize vessels condemned in any courts of admiralty, or vice-admiralty, as lawful prize, the appeal lies to certain *commissioners of appeals* consisting chiefly of the privy-council, and not to judges' delegates, and this by virtue of divers treaties with foreign nations, by which particular courts are established in all the maritime countries of Europe for the decision of this question, "*whether lawful prizes or not?*" for this being a question between subjects of different states, it belongs entirely to the law of nations, and not to the municipal laws of either country, to determine it.

ADRIANOPE RED, or LIZARY, a species of madder, coming from the Levant.

ADVANCE, denotes money paid before goods are delivered, a business performed on consignments of goods; it is usual with merchants to advance from one half to two thirds of their amount, on receiving invoice, bill of lading, and orders to insure them from sea risk, &c. &c.

ADVENTURE, a speculation in goods sent abroad under the care of a super-cargo, to dispose of to the best advantage for the benefit of his employers.

ADVENTURINE, or **AVENTURINE**, a precious stone of a yellowish brown colour, full of little specks, which seem to be of gold: it is found in Bohemia, Silesia, and in different parts of France; it is rather brittle, but takes the polish easy.

ADVICE, is usually given from one merchant or banker to another *by letter*, informing him of the bills or drafts drawn on him, with all the particulars of date, or *sight*, the sum, to whom made payable, &c. and where bills frequently appear for acceptance or payment, they are refused to be honoured for *want of advice*. It is also necessary to give advice as it prevents forgeries: if a merchant accept or pay a bill for the honour of any other person, he is bound to advise him thereof, and this should always be done under *an act of honour* by a notary public.

ADULTERATION, the act of debasing by an improper mixture. We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, &c.

Adulteration of coin is effected by making use of a wrong metal, or an undue alloy, or too great an admixture of the baser metals with gold or silver; *adulterating* is somewhat less extensive than *debasement*, which includes diminishing, clipping, &c. To adulterate or debase the current coin is a capital crime in most nations.

ADVOCATE, is still used in countries and courts where the civil law obtains, for those who plead and defend the causes of clients trusted to them. *Lord Advocate* or *King's Advocate*, one of the great eight officers of state in Scotland, who as such sat in parliament without election; he is the principal crown lawyer in Scotland, his business is to act as public prosecutor, and to plead in all causes that concern the crown.

ADZE, or **ADVICE**, a cutting tool of the axe kind, having its blade made thin and arching, and its edge at right angles to the handle, chiefly used for taking off thin chips of timber or boards, and for paring away certain irregularities, which the axe cannot come at. The adze is used by carpenters, but more by coopers, as being convenient for cutting the hollow sides of boards, &c.

ÆGYLOPS. (*Bromus arvensis*, Lin.) The great wild oat grass, or drank. It grows in hedges and the sides of fields in May. By culture it becomes a species of corn. In the northern parts of America it is improved to great advantage; and in the low wet boggy grounds of Great Britain it would be profitable, as it thrives best in water. It grows like oats, but in quality resembles rice.

ÆGYPTIACUM, a name formerly given to several medicinal preparations, the

only one of which now in use is that called *mel ægyptiacum*, which is composed of honey and verdigris. It is useful for cleansing foul ulcers, and is much employed by farriers for that purpose.

AEM, **AM**, or **AME**, a German liquid measure; it is commonly of 20 vertels, or 80 masses; at Heydelberg it is of 12 vertels, and the vertel of 4 masses, which reduces the *aem* to 48 masses; at Wirtemberg the *aem* is of 16 yunes, and the yune of 10 masses, which makes the *aem* about 160 masses. This measure is not the same as the *aam* of Amsterdam. See **WEIGHTS AND MEASURES**.

ÆSTUARY, in Geography, denotes an arm of the sea which runs a good way within land, such is the Bristol Channel, and many of the friths of Scotland.

ÆTITES, *Eagle-stone*, a flinty or crusted stone, hollow, and containing a nucleus, which, on shaking, rattles within. It is found in several parts of the continent; near Trevoux in France, a pit a few feet deep cannot be dug without finding strata or beds of the coarser or ferruginous kind. They are originally soft, and of the colour of yellow ochre. But the finest and most valued of all the eagle stones are accidental slates of one or other of our common pebbles.

AFFA, a weight used on the Gold Coast of Guinea. It is equal to an ounce, and the half of it is called *aggeba*. Most of the blacks on the Gold Coast give these names to the above weights.

AFFIDAVIT, signifies an oath in writing, sworn before some person who is authorised to take the same, as, for example,

Affidavit of Goods sold and delivered.

§. A. B. of, &c. maketh oath, and saith, that C. D. of, &c. named in the procuration or letter of attorney hereunto annexed, is justly and truly indebted unto him, this deponent, in the sum of £— sterling, for goods and merchandizes sold and delivered, as more fully appears by the account also hereunto annexed.

Another for Goods sold and delivered, when made by a Clerk.

§. A. B. of, &c. clerk to Messrs. C. and D. of, &c. maketh oath, and saith, that E. F. of, &c. named, &c. is justly indebted unto the said C. and D. for goods and merchandizes sold and delivered to the said E. F. and shipped for them by this deponent; and this deponent further saith that the several accounts and invoices also hereunto annexed, and marked A. No. 1, were duly extracted from the books of the said C. and D. and examined by him this deponent.

There are affidavits in commercial transactions of various kinds, but these are sufficient by way of example.

AFFIRMATION in law signifies an indulgence allowed to Quakers, who, in cases where an oath is required, may make

a solemn affirmation, that what they say is true; and if they make a false *affirmation*, they are subject to the penalties of perjury. It is not allowed in criminal prosecutions.

AFFRAY signifies, in legal language, a fighting in that *public manner* that tends to *affright* other peaceable persons, derived from the French word *effrayer*. Offenders subject themselves to be set in the stocks by a constable on view, and to give security before a magistrate for keeping the peace. 4 *Black. Com.* 145.

AFIOUME, or FIUME, a kind of flax, which comes from Egypt by way of Marseilles and Leghorn.

AFRICA is the first in alphabetical order of the four grand divisions, by which geographers have distinguished the great continents of the terraqueous globe. It is surrounded on every side with water, except where it is joined to Asia by the Isthmus of Suez, which separates the Mediterranean Sea from the Red Sea, and is but about one hundred miles in breadth. Thus it is peninsular, bounded on the north by the Mediterranean, which divides it from Europe; west by the Atlantic, which separates it from America; south by the Southern Ocean; and east by the Isthmus of Suez, the Red Sea, and the Indian Ocean. This quarter of the globe is neither so fertile, nor so populous, as the other three, there being in the interior immense deserts of burning sands; beside which, the greatest portion of this continent being within the torrid zone, the heat is nearly intolerable. The coasts, however, are fertile, and the country abounds with wild animals, valuable, in a commercial view, for their skins or their feathers. Among these are to be reckoned, the Camel, the Hippopotamus, the Rhinoceros, the Zebra, and the Ostrich. It also abounds in gold dust, fruits, and many other vegetable productions peculiar to hot countries; all of which will be noticed, individually, under the respective divisions into which this continent almost necessarily resolves itself, by the distinctions of natural produce, government, religion, and manners. The greatest length of this continent is short of 5000, and its greatest breadth of 4000 miles. There are some large rivers; among which are reckoned the Nile, the Niger, the Zaire, the Senegal, and the Gambia, and several of inferior magnitude, but of nearly equal importance to the inhabitants of the coast, especially on the western one. The inhabitants consist of Pagans, Mahometans, and Christians. In the whole interior of the country, from one tropic to the other, they are exclusively Pagans, (with the exception of a few Jews, who are scattered over the whole approach to the northern extremity, and carry on all the trade.) These are, no doubt, the original inhabitants of Africa, and are all blacks. The northern parts are inha-

bited principally by Mahometans. In the southern and eastern, are some Christians, with a mixture of all other descriptions of religious faith.

Northern Division of Africa. This skirts the coast from the Isthmus of Suez to the extremity of the empire of Morocco; is the breadth of the northern extremity of this continent, from east to west, and is denominated the *Barbary Coast*. There is nothing but a desert in this division, till we come to the kingdom of *Tripoli*, bounded by the Mediterranean on the north; by Mount Atlas on the south; and by the dominions of Tunis on the west. This kingdom is divided into six provinces, of which Tripoli is the capital; and, indeed, the only place of any importance. The inhabitants are Mahometans, and tawney, with a mixture of Jews and renegadoes from all parts of the world. The principal articles of commerce peculiar to Tripoli are *ashes, feathers, and skins*. Foreign gold and silver coins pass here according to their weight and standard; but accounts are kept in piastres, and grimmellins, and aspers.

The next contiguous state in the same direction, is that of *Tunis*. Its capital of the same name stands on a point of the Gulph of Golette, ten miles from the Mediterranean sea, is five miles in circumference, and a place of considerable strength and importance. The kingdom is divided into eight districts, but the trade, wealth, and power, are wholly absorbed by the capital, which has within it more than 10,000 families.

The celebrated Carthage is within this division of the Barbary coast. The inhabitants of Tunis are a mixture of Turks, Moors, Arabians, Jews, and Christians, of various nations. Their general character is superior to that of all the Barbary nations, inasmuch as the arts and commerce are more cultivated among them, and their manners therefore less ferocious. The Tunisians export fruit, ivory, oil, wax, honey, wool, hides, leather, sponge, corn, madder roots, &c., and have some manufactures, particularly of velvets, silks, and linens. They import fine wool and woollen cloth, spices, sugar, wine, spirits, vermilion, and other colours, hardware, iron, steel, paper, &c. &c. The principal part of the revenues of the state arise from the duties on exports. Most European kingdoms have consuls here, who are treated with respect. All *public* instruments are in the Arabic language, much corrupted; but the common affairs of life are conducted in the jargon, denominated *lingua Franca*. Burboes, Aspers, and Piastres, are the current monies at Tunis, in which accounts are kept.

Algiers is the next state to Tunis, and takes its name from its capital, which is now

the only place of consideration in the kingdom, the others having fallen into decay. It is divided into 18 provinces; but, except on the sea-coast, where the air is salubrious and the verdure fine, the country is almost a desert, abounding, indeed, in a great variety of beasts and birds, as lions, tygers, leopards, &c.; but above all, in ostriches, which, on account of their feathers, are highly valuable. The city of Algiers stands on a declivity close to the sea; is about three miles in circumference; is supposed to contain a population of more than 100,000 persons, of whom nearly 20,000 are Jews; and, till very lately, an average of 2000 Christian slaves. The Algerines are considered the most cruel and dangerous people of all Africa, being ferocious by nature, perfidious upon system, and repacious from habit. They have for centuries been averse from labour, holding commerce in contempt, and living almost altogether by piracy. The religion of the state is Mahomedan, but all the commerce is carried on by Jews. They export ostrich feathers, wax, honey, hides, fruit, copper, corn, oil, and live bullocks and sheep. The imports are principally gold and silver embroideries, spices, sugars, rice, linens, lead and pewter, dye-woods, and spirits, especially rum. But on the whole there is but little trade carried on at Algiers, compared with some other of the Barbary States. All sorts of Spanish money are current here; but accounts are usually kept in Saines, or Doblés, of 50 Aspers.

The united empire of *Morocco*. and *Fez* compose the westernmost state of the coast of Barbary. This was the ancient Mauritania, and is divided from Algiers by a considerable river (the Mulvia); is bounded on the south by the celebrated mountain, called the Great Atlas; on the north by the Mediterranean; and on the west by the Atlantic Ocean. This empire is divided into 14 provinces, in which are situated several places of considerable consequence. Morocco, the capital, is eight miles in circumference, enclosed by a wall and ditch; is pleasantly situated on an extensive plain, well watered; contains more than 20,000 inhabitants, consisting of a large portion of Jews, who carry on most of the trade, and are extremely rich, though heavily taxed. Fez is the second city of the empire, and considered the great magazine, and mart of it, a river of the same name passing through it, and dividing itself into several canals, for the conveyance of merchandize. Maquinox is also a considerable place, and has a great market. Sallee is the principal port, and is a capacious but shallow harbour. Tangier, anciently Tigris, once in possession of the English, being the dowry of King Charles the Second's Queen, was a sea-port of some importance, but is now reduced to a mere fishing town. The em-

pire of Morocco being locally situated opposite to Gibraltar, and in the vicinity of those parts of Europe with which Great Britain has so intimate a connection, a superior interest cannot but be necessarily attached to it. The Emperor of Morocco has very recently issued a decree, encouraging European merchants to settle in his dominions, offering encouragement and support; and particularly placing them under the protection of all the governors and magistrates of his empire.

The commerce hitherto carried on between the British dominions and the coast of Barbary, has, in general, been both trifling and indirect, but is capable of great extension. The principal articles for exportation in Morocco, are skins, hides, and leather of all kinds, furs, wool, flax, fruit, wax, honey, feathers, pot-ash, gold-dust, and corn. The imports are cloths of all kinds, muslins, calicoes, fustians, spices, cochineal, colours, iron, tin, brass, steel, drugs, looking-glasses, watches, sugar, spirits, &c. &c.

The coins are *Sluces*, *Blanquilloes*, and *Ducads*; and all Spanish money is current.

The Moors of this part of the African coast carry on a brisk trade with Gibraltar, in cattle, fish, game, and fruit.

Western Division of Africa. This coast, which is washed by the Atlantic from the tropic of Cancer to that of Capricorn, and even beyond it, comprehends a great number of rivers, and separate independent native governments and European settlements. From the empire of Morocco to Cape de Verd, the most westerly point of this continent, the country comprises small states, subject to the governments of Moorish princes, in which there is nothing particularly worthy of notice, as except a district called the *Gum* Desert, there is no portion of it which particularly produces any article of commercial intercourse. Cape Verd, somewhat fancifully said to be so called from its extraordinary verdure, is situated between two large rivers, the Senegal and the Gambia. The trade up these two rivers consists principally in gold dust, ivory, wax, hides, indigo, rice, millet, ostrich and heron feathers, &c. The principal exports, which are bartered in exchange for these articles, are bar iron, copper vessels and plates, coarse woollen and cotton goods, combed wool, linen shirts of different qualities, white thread, needles, glass beads, sabres, fire-arms of all kinds, gunpowder, ball, shot and flints, padlocks, knives, scissars, small looking-glasses, ordinary trinkets, especially of silver, and some scarlet cloth for the princes and great men. On this part of the coast is cultivated, with industry and success, by the natives, the plant Manioc, the fruit of which, like our potatoe, grows at its roots. It is 18 months in coming to maturity, and re-

quires a long and troublesome process to render it useful; but when completed is nutritious, and makes bread of rather an insipid flavour.

The river Sierra Leone, rendered interesting to us of late by the expensive settlement which we have made upon it, bounds that portion of the coast north, which is called Malaguette; whence comes the name of a pepper, which makes a great article of trade, more commonly known among us by the name of Guinea Pepper, as the district of country is by that of the Guinea coast. Here the best ivory of the whole continent is to be found, as well as civet and ambergris; and there are all the varieties of quadrupeds in the interior, for which Africa is celebrated, from the elephant to the monkey. There are also great diversities of poultry and fish, and the tropical fruits are in abundance.

We next come to what has been long denominated the Gold Coast, bounded on the north by a river of the name of Da Costa, and on the south by another river called Volta. Here are the gold mines in the interior, from which the country takes its name; besides which considerable quantities of this metal are found, after the heavy rains, to which the climate is subject, washed down into the rivers, brooks, &c.; which the inhabitants collect in wooden bowls, and, after washing, barter for European commodities, particularly for woollen, cotton, and silk manufactures, for beads, looking-glasses, earthen-ware, iron bars, and brandy.

Certain little shells serve the purpose of small money among the natives, all through the regions bordering on the coast. Between the Gulph of Guinea and Cape Negro, the southernmost point of any importance on this side of the African continent, intervene three kingdoms of considerable extent and population, viz. those of *Benin*, *Congo*, and *Angola*. There is little to distinguish these from the other countries on the western side of this continent, of which we have been treating, except that the land is in general better cultivated; trees are in greater plenty and variety, the natives more humanized, and the tame animals in greater request and abundance. Since the slave trade has been restrained, not to say abolished, by the European powers, the articles of traffic are nearly the same throughout all this line of coast.

The continent of Africa begins to contract itself rapidly from *Cape Negro* to the southernmost point, at which point is the Cape of Good Hope. To render the description therefore of this portion as succinct as possible, we shall suppose a line to be drawn across it, from Cape Negro to a corresponding point on the eastern or opposite coast, viz. *Mosambique*, which will present nearly an equilateral triangle, (each side

consisting of something more than 700 miles,) and give some description of the whole country within it, beginning from the Cape of Good Hope, and advancing northward to the ideal line already mentioned.

Cape of Good Hope. This place was first discovered by the Portuguese, in 1495; settled by them about 1600; afterwards was in the hands of the Dutch, and is now a British settlement. It is as advantageously situated for navigation and commerce as any place in the world, and will probably become, at no very remote period, one of the most valuable of our dependencies.

The climate here is divided into two seasons only, winter and summer; or the wet, and the dry, monsoon. The wet season begins in March, the dry in September; so that the summer begins at the Cape about the time it concludes with us. Their summer is excessively hot, their winter far from severe, but wet. They have no thunder or lightning, but in March and September, but they are subject to very violent winds, which do great damage to the corn and fruits, and endanger any shipping that are near the coast. They have not only great plenty, but great variety of springs, which abound in waters, both agreeable to the palate, and medicinal. They have excellent clay for making bricks, earthen-ware, chalks, both white and red, various bituminous substances, stone of a durable kind for building, lime-stone, flint, and beautiful marble. Most kinds of European grain thrive here; but, it is said, oats the least of any. Beside what trees might be indigenous, numerous kinds have been introduced, as well from India as Europe, which thrive well. They have oak, fir, pine, cypress, orange, lemon, citron, quince, pomegranate, apricot, apple, pear, peach, plumb, chesnut, walnut, and almond trees; and the vine in great variety has been of late years introduced, and succeeds beyond expectation. Aloes are of spontaneous growth, and flax and hemp have been introduced. Horticulture flourishes, and every table vegetable known in Europe grows to admiration; indeed, much exceed in size those of the countries from which they were exported. Domestic animals and tame cattle are plentiful. The oxen are fine, and the sheep numerous. Those belonging to the country have a peculiarly large tail, weighing 20 pounds, or upwards, which yields a prodigious quantity of grease. The wild animals are much the same as in other parts of Africa, but the wild asses abound. They have buffaloes, civet cats, wolves, and wild hogs. Of birds they have great variety, but for use the goose predominates over most others: of these they have various species, and all of them good. Of fish they have innumerable quantities and kinds, as well

those known in Europe as others peculiar to their own shores. In short, nature has no where bestowed greater plenty from the abundance of her stores than on the Cape of Good Hope and the adjacent country; and no doubt remains that most of the produce of both the East, and West, Indies would thrive here, if properly introduced and encouraged. After having enumerated the articles in which it *does*, or *may* be made to abound, and observed upon its central situation, with respect to the other continents of the world, it is unnecessary to be more particular respecting its commerce.

The region of the Cape of Good Hope is immediately flanked by the country of the Hottentots, extending as far northward as the tropic of Capricorn; a harmless and inoffensive, but indolent people; of a dark olive complexion, filthy in their habits, and excessively addicted to liquor of the strongest kinds. They are not, however, without ingenuity, and make good handicraftsmen. There is no doubt but as the colony of the Cape increases in size, and the influence of society and wealth spreads over its vicinity, these people will become more expert, and more addicted to the habits of civilized life.

Eastern Division of Africa. — The kingdoms of *Sofala* and *Monomotapa*, which lie to the north of the Hottentots, abound in gold and ivory, which are brought to *Mozambique* on the eastern coast, and bartered for the productions of Europe with the Portuguese, who have settlements here. *Melinda* is the last kingdom in Africa, from the Cape of Good Hope to the streights of Babelmandel, at the entrance of the Red Sea, where European ships anchor in order to trade. Here also the Portuguese have settlements, and exchange the produce of Asia and of Europe for those of this continent.

No other place on the eastern side of this continent presents itself to the attention of the commercial reader, till we arrive at the kingdom of *Egypt*, and of this it is unnecessary to notice more than its capital, *Grand Cairo*, which carries on a considerable and an increasing trade by means of Alexandria and Rosetta, its ports. They are distant from one another about 50 miles, and from the capital itself about 400 miles. At one or the other of these all European ships discharge their merchandize destined for Cairo, and take in their return cargoes. The exports from *Egypt* are numerous, and of great variety; drugs of many kinds, as rhubarb, opium, coculus indicus, sassafras, gums of almost all sorts, aloes, assa-fetida, saffron, &c.; fruits, as spices, tamarinds, &c.; manufactures, as carpets, linen, and silk handkerchiefs, and other articles of dress worked with gold, taffetas and other light silks; pebbles highly polished for various purposes of utility or ornament; leather prepared like that of Morocco Mocha coffee, wax, ivory, and mother of pearl. The im-

ports are even more numerous; lead, tin, fire-arms, cutlery, hardware, instruments of all kinds, arsenic, black lead, antimony, quicksilver, vitriol, brass wire, paper, dyewoods, glass beads, cloths of nearly all kinds.

Business in general is done by the assistance of brokers, who are mostly Jews. Merchants who consign goods to Cairo must take especial care relative to the packing them, for the excessive heat is such as few cases or barrels can stand, if not secured by extraordinary means. Accounts are kept in piastres of 128 aspers.

AFSLAGERS, are at Amsterdam, auctioneers appointed by the burgomasters for attending public sales; they are also called *vendic meester*.

AFT, in the sea language, the same as *abaft*.

AGALLOCUM, or AGALLOCHUM. See ALOES-WOOD.

AGARIC, a species of fungus growing on the branches of several trees, particularly the oak; from its readiness to take fire it is sometimes called *touch-wood*. It grows in the form of a horse's hoof; externally it is of a dusky ash colour, and internally of dusky red; it is soft and tough. The best time for taking it from the trees is in autumn when the weather is fine, and after great heats. Beat into a pulp, and applied to a wound, it is used to stop bleeding.

AGATE, (GER. *Achat*. DU. *Achaat*. DA. and SW. *Agat*. FR. *Agate*. IT. SP. and PORT. *Agata*. RUS. and POL. *Agat*. LAT. *Achates*.) A genus of semi-pellucid gems which takes its name from the river *Achates* in Sicily, on the banks of which it is found. These stones are variegated with veins and clouds, but have no zones like those of the onyx. They are composed of crystal, coloured by a large quantity of earth.

Agates are arranged according to the different colours of their ground. Of those with a white ground there are three species, 1. The *dendrachates*, *Mocoa stone*, or *arborescent agate*. 2. The *dull milky-looking agate*. This species is common on the shores of rivers in the East Indies, and also in Germany and some other parts of Europe. 3. The *lead-coloured agate*, called the *phassachates* by the ancients.

Of the agates with a *reddish* ground there are four species, 1. An impure one of a *tight flesh-colour*; this is sometimes variegated by spots of irregular figures or veins. It is found in Germany, Italy, and some other parts of Europe. It is of but small value, and is wrought into toys, and sometimes into the German gun-flints. Particles of moss are sometimes found imbedded in it. 2. Of a pure *blood-colour*, called *hæmachates* or the *bloody agate* by the ancients. 3. The *clouded and spotted agate*, of a pale flesh-colour, called by the ancients the *cornelian achates* or *sardachates*. 4. The *red-lead*

coloured one, variegated with yellow, called the *coral agate*.

Of those with a *yellowish* ground there are two species, 1. That of the colour of yellow wax, called *cerachates*. 2. A very elegant stone, of a yellow ground, variegated with white, black, and green, called the *leonina* and *leontesera*, or lion stone.

Of the agates with a *greenish* ground there is only one known species, called *jaspachates*.

Of all these species there are many varieties, some of them having natural representations of animals, trees, letters, &c.

Considerable quantities of these stones are still found near the river Achates in Sicily. The oriental ones are all said to be brought from the river Gambay. A mine of agates was some time ago discovered in Transylvania, of divers colours, some of them weighing several pounds. The lapidaries pretend that the Indian agates are finer than the Sicilian, but Labat states that in the same quarries there are found pieces much finer than others, and these fine pieces are sold for Indian agates in order to enhance their prices.

Agates may be stained artificially by a solution of silver in nitric acid, and afterwards exposing the part to the sun. This fact will make some of those curious figures we find in them suspected of being the work of art: this may be determined by laying them for a few hours in *aqua-fortis*, when the artificial figures will disappear.

AGATE is also a name of an instrument used by gold-wire drawers, so called from the agate in the middle of it.

AGE, with reference to legal and commercial transactions, is of most material importance, as by age the periods are determined when persons are enabled to execute certain powers and privileges, make contracts, and be liable to answer for offences. The ages of males and females are different for different purposes. At *fourteen* years of age a *male* may consent to marriage, may choose his guardian, and is not disqualified from making a disposition of personality; at *seventeen* he may be an executor; and at *twenty-one* he may make contracts, and do *all acts* which the law allows to persons of sound mind. A female at *seven* years of age may be betrothed in marriage, at *nine* is dowable, at *twelve* may consent to or dissent from marriage, at *fourteen* may appoint a guardian, at *seventeen* may be an executrix, and at *twenty-one* is of *full age*, in like manner as a *male*.

The law of England privileges persons under *twenty-one* from punishment for many offences of *omission*, because it presumes them to be without the capacity to perform; but for offences of *commission*, there is no absolutely determinate rule. Persons under the age of *fourteen* years are *generally* holden not liable to suffer for capital crimes; but

this rule is by no means universal, for every year produces in practice many exceptions; the ascertained discernment or judgement of the infant is holden equivalent to the supposed discretion arising from superior age. 4 *Black. Com.* 22.

AGENT, is a person employed or taken to be employed by another to transact business in the place of his employer. For all contracts therefore, entered into by a person in the capacity of an accredited agent, the principal is generally answerable. On the other hand, the principal has in equity in many cases a right to a discovery of the transactions of his agent, and a demand of the property with which he was entrusted, or the value of it, even against those with whom the agent has had dealings. A notice to an agent as purchaser for another, is good notice to the principal. Where one acts in execution of the authority given by another, it is the act of that other, and the agent acquires no right, nor brings any obligation on, himself. But if such person act without authority, as agent of another, he is liable himself for his acts. There are frequently nice distinctions arising out of the difference between a general and a special authority given to a person to act as the agent of another, especially in commercial transactions, but they are too numerous as well as too nice to admit of specification. See the following authorities on the subject. *Fenn v. Harnson*, 3 *Term Rep.* 757. 4 *Ditto*, 177. *Whitehead v. Tucket*, 15 *East. Rep.* 400. *Le Fevre v. Lloyd*, 1 *Marsh. Rep.* 318.

AGENT AND PATIENT. The agent is doer of a thing, and the patient the party suffering the thing to be done; as where a woman endows herself of the best part of her husband's possessions, this being the sole act of herself to herself, makes her *agent* and *patient*. Also if a man be indebted unto another, and afterwards he makes the creditor his executor, and dies, the executor may retain so much of the goods of the deceased as will satisfy his debt; and by this retainer he is agent and patient, that is, the party to whom the debt is due, and the person that pays the same.

AGGOUED-BUND, in Bengal, is the silk produced, in the most favourable season of the year.

AGIO, (signifies aid or assistance, being a Venetian word,) a bank term in Holland, and expresses the difference between money, bank money, or current money, and cash. If therefore a merchant sell his merchandize, stipulated to be paid, either 100 livres bank money, or 105 cash or current money, in such case the *agio* is said to be 5 per cent. As the *agio* varies almost in every country, the mode of calculating it will be found under the word *Exchange*.

AGITO, also called *Giro*, a small weight used in the kingdom of Pegu: two agitos make a half biza, and the biza weighs a

hundred tecalís, equal to 2 lb. 5 oz. *heavy*, or 3 lb. 9 oz. *light weight* of Venice.

AGNEL, an ancient French gold coin, first struck under the reign of St. Louis, worth about 12 sols, 6 deniers, or 7½d. sterling. The agnel is sometimes called *moreton d'or*, and *agnel d'or*, from the figure of a lamb struck on one side.

AGNELET, an ancient silver coin, worth about 20 sols, first struck under Philip le Bel.

AGNUS-CASTUSSEED, (GER. *Schafmütten*. DU. *Kuischboomzaad*. DA. and SW. *Agnus-Castus frö*. FA. *Petit poivre*. IT. *Semenza d'agnocasto*. LAT. *Agni-Casti Semen*.) also called vitex seed, from the chaste tree.

AGNATI, the relations by the *father*, who were preferred by the Roman laws to the *cognati*, or relations by the *mother*: till the edict of the emperor Justinian, Nov. 118, abolished all distinctions between them. 2 *Black*. 235.

AGREAGE, so called at Bourdeaux, elsewhere called *courtage*, (brokerage.)

AGREEMENTS, are the consent of two or more persons concurring, the one in parting with, and the other in receiving some property, right, or benefit. Agreements are of various kinds, and in various forms; but there must be such words in all as show the meaning and assent of the contracting parties; and they must be certain and complete. They may be *executed* agreements, referring to matters past or present; or they may be *executory*, and bear reference to matters to be done at a future period.

A very small number of forms is sufficient for illustration, and more would only suffice for mischief, by inducing mercantile persons to attempt doing that for themselves which can only be executed with skill and safety by the assistance of men professionally astute.

All agreements are subject to a stamp duty.

An Agreement between a Debtor and his Creditors by Indenture.

This indenture, made this day of —, in — year of the reign of our sovereign Lord George the —, by the grace of God, king of the united kingdoms of Great Britain and Ireland, &c. between A. B. of, &c. of the one part; C. D. of, &c. E. F. of, &c. and G. H. of, &c. creditors of the said A. B. of the other part. Whereas the said A. B. on the day of the date of these presents, stands justly indebted to his said creditors, in the several sums of money following, that is to say, to the said C. D. in the sum of —, to the said E. F. in the sum of —, and to the said G. H. in the sum of —, making in the whole, the sum of —, which said several sums of money, the said several and respective creditors, at the request of the said A. B. are contented, and do hereby re-

spectively agree to accept and take in such manner and proportion as hereinafter is mentioned. Now this indenture witnesseth, that the said A. B. for himself, his heirs, executors and administrators, doth hereby covenant, promise, and agree, to and with the said several creditors above named, their executors and administrators respectively, that he the said A. B. his heirs, executors, and administrators, or some or one of them, shall and will, by and with the consent, directions, nomination, and appointment of his said other creditors respectively, testified by their being made parties to these presents, and sealing and delivering hereof, well and truly pay, or cause to be paid, unto the said C. D. his executors or administrators, the full sum of — on — next ensuing the day of the date hereof, or within three days after, and the sum of — more monthly (as the case may be) on — of every month then next and successively following, or within three days after, until the said full sum of — is fully paid and satisfied, (or until the sum of [as the case may be] shall be paid,) which is hereby agreed by the said several respective creditors, to be in full satisfaction and discharge of the aforesaid sum of —, and of all other sum and sums of money, now due or owing to the said creditors above named, or any of them respectively, upon special trust and confidence nevertheless, and to the intent and purpose that he, the said C. D. his executors and administrators, shall and will upon demand pay and satisfy unto each and every of the said creditors above named, an equal part and share of all such sum and sums of money, as shall from time to time be so paid to him or them respectively, by the said A. B. in proportion to the several debts hereinbefore mentioned, to be due to the said several creditors hereinbefore named. And the said C. D., E. F. and G. H. creditors of the said A. B. as aforesaid, for themselves severally and respectively, and for their several and respective executors, administrators, and assigns, and not the one for the other, do and each of them doth fully covenant, promise, and agree, to and with the said A. B. his executors and administrators, that unless, and until some default shall happen to be made by the said A. B. his executors or administrators, of or in payment of the said several sums of money hereinbefore covenanted, to be paid to the said C. D. his executors or administrators, on the several days and times above limited for the payment thereof, according to the true intent and meaning of the said covenant and of these presents, that they, said creditors above named, or any of them, or any of their executors or administrators respectively, shall not nor will sue, arrest, imprison, implead, attach, seize, levy, condemn, or prosecute the said A. B. his heirs, executors, or administrators, or any of them, or their lands or tenements, goods

or chattels, or any part thereof, for or upon account of the said sums of money as aforesaid, or any other sum or sums of money now due or owing to them, or any of them respectively, in any wise however. And in case the said creditors, their executors or administrators, or any of them respectively, shall, before such default be made, act or do in any manner contrary to the said covenant, he the said A. B. shall be, and is hereby for ever acquitted, exonerated, released and discharged of and from all sum and sums of money, bills, bonds, reckonings, accounts and demands whatsoever, due, owing or belonging to, or which may or might be asked, claimed, or demanded by such of the said creditors respectively, so acting or doing contrary to the said covenant, for any matter, cause, or thing whatsoever, unto the day of the date of these presents. (*If occasion, add the following clause:*) And the said A. B. doth hereby covenant and promise, to and with the said several creditors above named, their executors and administrators, that within the space of —, after the said several creditors have sealed and executed these presents, he shall and will deliver to each of the said several creditors above named, a true account of all his stock or quantity of, &c. that he had by him on the — day of — and also a true list of all the goods and debts now due, owing, or belonging to him, from any person or persons whomsoever, together with an account of their names or places of abode, who have or owe the same. In witness whereof the said parties have hereunto set their hands and seals the day and year, in the beginning written.

Another, by Memorandum.

Memorandum.—Whereas A. B. &c. now stands indebted unto us, whose names are hereunto subscribed, in the several sums of money set opposite to our respective names, which he being unable at present to satisfy, hath requested us to grant him time of payment, in manner hereinafter mentioned; to which we have respectively assented; therefore we hereby do, and each of us doth, give unto the said A. B. time of payment thereof, in manner following, that is to say, — from the date hereof, for the payment of one — part of each of our respective debts, — for the payment of — thereof; and — for the payment of the residue thereof, with legal interest, to be computed on the whole of such respective sums of money, from the day of the date hereof, to wit, the — day of — as witness our hands, &c.

Agreement respecting a Concern with a Vessel in Copartnership.

Articles of agreement, indented, made, &c. between A. B. of, &c. of the one part, and C. D. of, &c. of the other part. Whereas the said A. B. hath this day purchased of the said C. D. one half part or share of all that

— or vessel, called the —, of the burthen of — tons, or thereabouts, and also one half part or share of all and singular, the anchors, cables, ropes, masts, sails, sail-yards, boats, oars, arms, ammunition, apparel, and furniture whatsoever, to the said — or vessel belonging, or in any wise appertaining, which — or vessel is now employed in — trade, whereof the said C. D. is master, as by the bill of sale thereof, reference being thereunto had, will more fully appear. Now this agreement witnesseth, and the said party doth hereby mutually covenant and agree to and with the other of them, his executors and administrators, by these presents in manner following, that is to say, first the said C. D. doth hereby covenant, promise, and agree, to and with the said A. B. his executors and administrators, that he the said C. D. shall and will from time to time, and at all times, so long as he the said C. D. shall continue master of the said — or vessel, duly enter or cause to be entered in some convenient book or books, by him the said C. D. to be kept for that purpose, a just and true account of all receipts, payments, and disbursements whatsoever by him the said C. D. to be received and paid for and on account of the said — or vessel, and the said employment thereof; and shall and will once in every — months deliver unto the said A. B. a true and faithful state of the said account or accounts by him to be kept as aforesaid; and also shall and will, on the delivery and statement of the said account or accounts, pay or cause to be paid unto the said A. B. his executors, administrators, or assigns, his the said A. B.'s half part or share of all the profits, benefits, and advantages, that may in any wise arise and be made by the said — or vessel, and the employment thereof; and the said A. B. doth for himself, his executors, and administrators, covenant, promise, and agree, to and with the said C. D. his executors and administrators, that in case loss or damage shall at any time be suffered or sustained by and on account of the said — or vessel, and the employment thereof, that then, and in such case, the said A. B. his executors, administrators, or assigns, shall and will pay, or cause to be paid, unto the said C. D. his executors, administrators, and assigns, when thereunto required (proper vouchers, and receipts being first delivered to him or them) his the said A. B.'s one half part or share of all such loss or damage so to be suffered or sustained as aforesaid; and for the true performance, &c. In witness, &c.

Agreement to extend Time for making an Award.

Whereas differences and disputes having arisen between A. B. of, &c. of the one part, and C. D. and E. F. of, &c. of the

other part, the said parties, in order to put an end thereto, entered into arbitration bonds, bearing date the —, in the penal sum of —, to abide by the award of G. H. of, &c. and J. K. of, &c. concerning the premises, so as they should make their award on or before the —, now last past; but if the said arbitrators should not make their award by that time, then to abide by the award or umpirage of L. M. of, &c. or of his nominee as therein mentioned, so as such umpire or nominee should make his award on or before the —, then and now next coming. And it was thereby amongst other things agreed, that if the said L. M. should decline taking upon himself the said umpirage, that the same should be ended and determined by such person as L. M. should nominate for that purpose. And whereas the said arbitrators did not make their award by the time limited in the said bonds; and the said L. M. declining the umpirage, and having nominated N. O. of, &c. in his stead, the said parties have agreed to extend the time for making his award to the — day of —, now next ensuing. Now it is hereby agreed, between the said A. B. C. D. and E. F. that the time for the said nominee's making his award or umpirage shall be, and the same is hereby extended to the said — day of — next; and that the said parties shall be bound by and perform the award and umpirage of the said N. O. if made in writing under his hand and seal, ready to be delivered to the said parties, or such of them as shall require the same, on or before the said — next, as fully and effectually, and in like manner as if the same had been made and delivered before the said —; and that this submission or agreement shall and may be made a rule of some of his majesty's courts of record at Westminster, if any of the said courts shall so please. And that the said bonds shall stand and be mutual securities for the due performance of such last-mentioned award or umpirage. In witness, &c.

AGRICULTURE, in its *primary* sense, signifies merely the cultivation of the earth; but that in which it bears reference to commerce is much more extensive, comprehending not only the operations by which agriculture is executed, as manuring, digging, ploughing, sowing, reaping, &c.; but the articles produced by means of those processes, as grass, corn, wood, and even the cattle, which are depastured, and brought to perfection by them. Particular information respecting these several articles individually, as objects of commerce, are treated of under their several appropriate denominations; but a general view of the agriculture of the British dominions, in the gross, is a necessary preliminary to the understanding of the subject in detail.

Tillage and pasturage, in colloquial lan-

guage, farming and grazing, are the two grand divisions into which agriculture, as a science, is separated. They are mutually subservient to each other on all occasions; but in some instances, as in the modern introduction of turnips, carrots, and such other roots for the use of cattle, as well as of, what are denominated, *artificial grasses*, the latter is entirely dependent on the former.

Under the general term *corn*, are usually comprehended wheat, barley, oats, rye, beans, and peas. These belong to the department of tillage. Turnips, carrots, potatoes, tares, vetches, and all the other esculents, which are cultivated for the immediate food of cattle in their green state, as well as all the different species of grass which are not indigenous, although produced by the operations of the spade, the plough, and the harrow, are in common parlance attributed to the division of pasturage, or grazing department of agriculture.

All the different products of the earth, as they are connected with commerce internal, or external; *direct*, as corn, hay, straw; or *remote*, as horses, oxen, sheep, and swine, which are reared and fed by means thereof; cannot be sufficiently considered under the general denomination of agriculture, but must, in a great degree, at least, as has been observed, be referred to their specific heads, as individual articles; but it may be interesting to give a mere sketch of the present state of agricultural produce throughout the kingdom.

Since the general prevalence of inclosures in England, there has been a more equal distribution of tillage, and pasturage, over the whole kingdom, than formerly; but still there is a preponderance of one or the other, as the circumstances of each district render most appropriate or convenient.

Near great towns, where cows for their milk, and horses for pleasure, are in much request, the land is generally in pasturage; in regions more remote from excessive population, especially in parishes not inclosed, tillage usually prevails. On chalky hills, on the downs near the sea-coast, and on the less extensive heaths which still remain, sheep are usually bred, and depastured till they are taken to the richer inclosures for feeding. The strong rich land is pretty equally divided between pasturage for oxen, or cows for extensive dairies, (which supply considerable articles of commerce in butter and cheese,) and corn, especially wheat and beans. The lighter land, consisting of sand, or loam, is principally dedicated to the growing of barley, oats, turnips, and artificial grasses. The northern parts of the kingdom, and a cold region in the centre of it, viz. in the county of Derby, as well as a large portion of Wales, produce, almost exclusively, oats, the meal of which is

made into cakes, which serve the inferior orders for bread. Barley is principally grown in Norfolk and Suffolk, and in some of the midland counties: at least these districts supply the chief quantity of this article for all the malt of the kingdom, so far as it composes an article of commerce. The eastern side of the island, comprehending parts of Lincolnshire, Cambridgeshire, and Essex, have been, at some period or other, covered with the sea, and are low and fenny. Those parts which have been best drained afford rich pasturage, and some good tillage land; but that which is but partially drained will only grow oats, and afford peat for firing, and a very coarse hay. Immense tracts of mountain and heath still remain in all the wild and uncultivated monotony of nature, at the northern and western extremities of the island. These, however, respectively supply hardy breeds of cattle, in which continual traffic is carried on with the other parts of the kingdom, to which they are driven to be fed; and on this supply the markets of the metropolis in a great degree depend.

Sheep and swine form totally distinct heads of consideration. They are, in their different species, bred and fed in all parts of the kingdom, and both compose very considerable ingredients in commerce, as well external, as internal; the reader is therefore referred to those particular heads, as they stand in alphabetical order, for the necessary information respecting them.

Ireland produces nearly the same agricultural commodities as Great Britain. It abounds in corn, grass, and cattle, in the last-mentioned of which a large importation is annually made into England. In time of war the fleet and army are, in a considerable degree, supplied with beef and pork from Ireland, and large quantities of the latter are at all times exported to different parts of the world, especially to the West Indian islands.

It also produces butter and cheese in great abundance, which, as has been observed, are considerable articles of traffic.

It may not be amiss, in concluding this article, to give the comparative estimate of the inhabitants of Great Britain, as divided into the three descriptions of population, viz. the agricultural, the mercantile, and the independent, or unproductive. In 1811, the population returns made England consist of 697,353 families of an agricultural description; 923,588, addicted to trade and manufactures, either directly or indirectly; and 391,450, who live independently of labour, on the produce of rents, or interest of money. The proportion of agriculture contrasted with manufacture, will rise higher if Wales be included, for their trade is quite in its infancy, and the farmers are to the merchants as two to one.

A GROUND, the situation of a ship

whose bottom hangs or rests upon the ground, so as to render her immovable.

A-HEAD, a sea term, signifying farther onward than the ship, or at any distance before her, lying immediately on that point of the compass to which her stern is directed. It is used in opposition to *astern*, which expresses the situation of any object behind the ship.

A-HULL, in the sea language, the situation of a ship when all her sails are furled, on account of the violence of the storm, and when, having lashed her helm on the lee-side, she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

AIGRIS, a stone which serves instead of current coin, among the Issinai, a nation of Africa, on the coast of Guinea, where the river Asbin runs, near the Gold Coast; it is of a greenish blue colour, without any lustre, hard, but does not take a good polish; they give its weight of gold for it. They make little bits of it, called *betiquets*, which are bored through in the middle, that they may string them on small threads, made of the bark of trees; they serve as ornaments for the beards of the kings, tresses being made of the hair, which are passed through those cylinders. Akœfini, a king of the Issinai, is said to have had, in the twenty tresses of his beard, sixty of those cylinders, which were worth at least 20,000 crowns.

AIR, in *Physics*, is now applied solely to the atmosphere, or that thin, fluid, elastic, transparent, ponderous, compressible, and dilatable body, surrounding the earth to a considerable height, and which is adapted for the respiration of animals. Other bodies, having some of the physical properties of air, but not adapted for the respiration of animals, were formerly called by that name, as carbonic acid, when in the gaseous state, was termed *fixed air*; those fluids have now received the name of *gases*.

AIR, in *Music*, is a tune, which is set to words, or to short pieces of poetry that are called *songs*.

AIR-Jacket, a sort of jacket made of leather, in which are several bags or bladders, composed of the same materials, communicating with each other. These are filled with air through a leathern tube, having a brass stop-cock accurately ground at the extremity, by which means the air blown in through the tube is confined in the bladders. The jacket must be wet before the air be blown into the bags, as otherwise it will immediately escape through the pores of the leather. By the help of this, a person may be supported in the water without making the efforts used in swimming.

AIR-Pipes are machines for drawing foul air out of ships, or other close places, by means of fire. These were first employed by Mr. Sutton, a brewer in London, and are usually called *Sutton's Air-Pipes*. One ex-

tremity is placed in a hole in the side of a furnace, closed in every other part except the outlet for the smoke; the other in the place which it is desired to purify. The rarefaction produced by the fire causes a current of air to be determined to it, and the only means by which the air can arrive at the fire being through the pipe, a quick circulation in the places in which the extremity of the pipe may be situated, is consequently produced. A machine capable of answering the same purpose was invented by Mr. Desaguliers, which he called the *ship's lungs*. It consisted of a cylindrical box set up on its edge, and fixed to a wooden pedestal. From the upper edge of the box issued a square trunk, open at the end, and communicating with the cavity of the box. Within this box was placed a cylindrical wheel, turning on an axis. It was divided into 12 parts by means of partitions placed like the radii of a circle. These partitions did not extend quite to the centre, but left an open space of about 18 inches diameter in the middle; towards the circumference, they extended as far as possible without interfering with the case, so that the wheel might always be allowed to turn freely. Now it must be evident, that if the wheel be turned towards that side of the box on which the trunk was, every division would push the air before it, and drive it out through the trunk, at the same time that fresh air would come in at the open space in the centre, to supply that which was thrown out through the trunk. If this machine, then, is placed in a room where a circulation of air is wanted, and the trunk made to pass through one of the walls; by turning the wheel swiftly round, the air will be forced with great velocity out of that room, at the same time that fresh air will enter through any openings by which it can have access, to supply that which has been forced out.

Besides these machines, the ventilators of Dr. Hales, and those called *wind-sails*, are likewise used for the same purpose. The former of which is an improvement of the Hessian bellows: the other is a contrivance for throwing fresh air into those places where putrid air is apt to lodge; but none of these means are so convenient nor effectual as the air pipes of Sutton.

AIR-Shafts, among *miners*, denote holes or shafts let down from the open air to meet the *adits*, and furnish fresh air. The damp, deficiency, and impurity of air, which occur when *adits* are wrought to a great length, make it necessary to let down air-shafts, in order to furnish a free circulation of air through the whole work.

AIR-Trunk is a contrivance of Dr. Hales, to prevent the stagnation of putrid effluvia in jails and other places, where a great number of people are crowded together in a small space. It consists only of a long square trunk open at both ends, one of

which is inserted into the ceiling of the room, the other extends a good way beyond the roof.

ALABASTER, (GER. Du. *Äl. Sw.* and *Pol. Aabaster*. IT. SP. and *Port. Alabastro*. FR. *Albâtre*. RUS. *Alabastr.* LAT. *Alabastrites*,) a kind of stone resembling marble, but softer. It is of various colours, but the white shining alabaster is most common; it is used by sculptors, for the formation of small statues, vases, columns, &c. &c. It is found in many parts of England, especially in Derbyshire and Nottinghamshire; near Newark, in the latter county, it is called simply *plaster*, and is burnt in ovens for the purposes to which that article is generally applied. See title GYPSUM.

ALB, a Turkish coin, also called *Asper*. See **ASPER**.

* **ALBE**, a small coin, current in Germany, worth only a French sol, and seven deniers, or $\frac{3}{4}$ d. English.

ALBERNUO, a kind of camlet, brought from the Levant, by way of Marseilles.

ALBUS, a small coin or halfpenny, current in Cologne, and in the countries of the Lower Rhine, 4 *albusses* make $4\frac{1}{2}$ *cruitzers*, or a simple *blaffart*. Its value is $\frac{3}{4}$ d. English.

ALCANNA, a drug used in dyeing, which comes from Egypt, and other parts of the Levant.

ALCAVALA, in the Spanish finances, is a per centage tax upon the sale of every sort of property, whether moveable or immoveable; and it is repeated every time the property is sold.

ALCHYMY, the branch of Chemistry, which had for its principal object the transmutation of metals into gold; an obsolete absurdity.

ALCOHOL, is a name applied to highly rectified *spirit of wine*. When pure, it is perfectly the same whether it be obtained from brandy, wine, or any other fluid which has undergone the spirituous fermentation. It is a light, transparent, colourless liquor, of a sharp, penetrating, agreeable smell, and of a warm, stimulating taste. The specific gravity of alcohol, when perfectly pure, is 0.800, but the strongest spirit which is afforded by mere distillation, according to Mr. Nicholson, is 0.820, at the temperature of 71°. The alcohol, or rectified spirit of commerce, has rarely a specific gravity below 0.8571.

Alcohol is used in medicine and the arts for a variety of purposes. It is the only solvent of many resinous substances, and consequently is usefully applied for the extracting and dissolving the colouring matter of those bodies.

ALDER, a tree, according to the classification of botanists, of the birch kind. It is too soft and flexible to be used for any better purposes than those to which turners apply most of the white woods. It is much

esteemed by them, as also for making water-pipes under ground, in which situation it will last a considerable time. The bark of the alder is useful to dyers in the preparation of some colours. It is a strong styptic. It is not generally esteemed to come under the denomination of timber, but is one of the kinds of wood comprehended under that appellation in stat. 13 Geo. 3. c. 33. made for the protection of woods.

ALDERMAN, is defined by Johnson to be "an incorporated magistrate," but erroneously; for there are numerous instances of aldermen who are not magistrates, and of incorporated magistrates who are not aldermen. Among our Saxon ancestors, alderman was a title of nobility. It is now generally understood to designate an associate to the mayor, or other head officer, of a city, borough, or town, incorporated by charter, or otherwise. The numbers, powers, and privileges of these officers differ from one another extremely, according to the antiquity of each respective incorporation, the extent of the civil community over which they are respectively appointed to preside, and other circumstances. The 26 aldermen of London preside over an equal number of wards: they have particular privileges and immunities by charter and custom, not necessary to be enumerated here.

ALE, a fermented liquor, obtained from an infusion of malt, and differing from strong beer chiefly in having a less proportion of hops. Various sorts are known in the United Kingdoms of Great Britain and Ireland, particularly *pale* and *brown*: the former is brewed from malt slightly dried, and is esteemed more viscid than the latter, which is made from malt more highly dried, or roasted. See **BEER**. The duties on beer and ale make a principal branch of the revenues in England. They were laid the 12th year of Charles II. and have been continued, by several subsequent acts of parliament, to the present time. See **DUTIES**.

ALE-CONNER, an officer in London, who inspects the measures used in public-houses. There are four ale-conners, who are all chosen by the common council of the city.

ALE-HOUSES, must be licensed by justices of the peace, who take recognizances of the persons licensed, and of their sureties, viz. 10*l.* each, that they will not suffer unlawful gaming, or other disorderly practices in their houses. Every person, excepting those who sell ale in fairs, selling ale without licence is liable to a penalty of 20*l.* for the first offence, and disqualification to sell ale thereafter for a second offence, with all costs. The licence is granted on the first day of September, or within 20 days after, at a general meeting of the justices for the division to which the applicant belongs, upon his producing a certificate to his character, unless, by living in a city or town

corporate, this last circumstance is dispensed with, and continues in force for one year only. Ale-house keepers, selling ale in short measure, are liable to a penalty not exceeding 40 shillings, and not less than 10 shillings. They are likewise liable to a fine of 40 shillings for permitting gaming by inferior persons. 50 Geo. 2. c. 24.

ALE-SILVER, a tax paid annually to the lord mayor of London, by all who sell ale within the city.

A-LEE, in the sea language, a term only used when the wind, crossing, or flanking the line of a ship's course, presses upon the masts and sails, so as to make her incline to one side, which is called the lee-side; hence when the helm is moved over to this side, it is said to be *a-lea* or *hard-a-lea*.

ALEGAR, sour ale, used by the dyers.

ALEMBIC, a chemical vessel usually made of glass or copper, formerly used for distillation; the bottom part, which contains the subject for distillation, is called, from its shape, the *cucurbit*; the upper part, which receives and condenses the steam, is called the *head*, the beak of which is fitted into the neck of a receiver. Retorts, and the common *worm-still*, are now more generally employed.

ALFANDIGA, the name of the custom-house at Lisbon.

ALGORITHM, an Arabic word, expressive of numerical computation.

ALIBI, a colloquial term among the vulgar, used to express that a person under trial for any crime was *elsewhere* at the time it was committed.

ALICENDE, an Ethiopian tree, from which a flax is prepared, and cloth made.

ALIEN, in law, a person born out of the king's allegiance, in contradistinction to a denizen or natural subject. The word is formed from the Latin *alius*, "another;" *q. d.* one born in another country. An alien is incapable of inheriting lands in Britain, till naturalized by an act of parliament; nor can he enjoy any office, vote at an election for members of parliament, or be returned on any jury, unless where an alien is a party in a cause, when the inquest is composed of an equal number of denizens and aliens. The reasons for establishing these laws were, that every man is presumed to bear faith and love to that prince and country, where he received protection during his infancy; and that one prince might not settle spies in another's country; but chiefly that the rents and revenues of the country might not be drawn to the subjects of another. Some have thought that the laws against aliens were introduced in the time of Henry II., others that it is an original branch of the feudal law; for, by that law, no man can purchase any lands, but he must be obliged to do fealty to the lords of whom the lands are holden; so that an alien who owed a previous faith to another prince, could not take an

oath of fidelity in another sovereign's dominions. It was claimed as a right of the prerogative of the crown of England to send aliens out of the kingdom at its pleasure ; but there were differences of opinion, not only respecting the mode of exercising the right, if admitted, but also respecting the claim of right itself. Wherefore, by 43 Geo. 3. c. 155. continued and amended by subsequent statutes, as circumstances required (viz. in 56th and 58th of Geo. 3.), it is provided, that the king may by proclamation, or order in council, direct any alien to depart the kingdom, on pain of being apprehended and imprisoned, &c. &c. And all aliens permitted to remain are to be registered in the manner directed by the statute, and to be under the surveillance of the magistrates where they reside. By these statutes, masters of vessels are prohibited, under severe penalties, from landing aliens, without making a declaration of their names, &c. ; and the aliens themselves are prohibited, under penalty of imprisonment, from landing, without delivering a declaration in writing of their names, &c. &c. to certain persons appointed to receive the same.

ALIENATION, is the act by which one man transfers the property and possession of lands, tenements, &c. to another.

ALIEN'S-DUTY, is otherwise called *petty customs and navigation-duty*. Fish dried or salted, and cod-fish or herrings not caught in British vessels, and cured by British subjects, pay a double *alien's-duty*.

ALIMONY, is that allowance which every woman is entitled to from her husband, except in cases of elopement or adultery.

ALIQUNT PART, in arithmetic, is that number which cannot measure any other exactly without some remainder. Thus 7 is an aliquant part of 16 ; for twice 7 wants 2 of 16, and 3 times 7 exceeds 16 by 5.

ALIQUT PART, is that part of a number or quantity which will exactly measure it without any remainder. Thus 2 is an aliquot part of 4 ; 3 of 9 ; 4 of 16, &c.

ALKALIES, a class of saline substances, possessing in general the following properties : — They have an acrid taste ; they change the blue juices of vegetables to a green, and the yellow to a brown colour ; and they have the property of rendering oil miscible with water. They are readily soluble in water ; quickly destroy the organization of animal bodies ; and with acids form neutral salts.

Alkalies have been usually divided into fixed, and volatile. Of the former there are two species — potash, and soda, or, as they are frequently called, vegetable and mineral alkalies ; from the former being obtained from vegetable substances, and the latter principally from mineral bodies, particularly sea salt, which consists principally of muriate of soda. The volatile alkali is

properly called ammonia. Potash and soda have been discovered by Sir H. Davy to be oxides of metals, which he has called potassium and sodium. — For a more particular account of these substances, see **POTASH**, **SODA**, and **AMMONIA**.

ALKANET, **ANCHUSA**, or **BUGLOSS**, (GER. *Orkanet*. DU. *Ossetong*. DA. *Oxetunge*. SW. *Röd Oxetungerot*. FR. *L'Orcanette*. IT. *Ancusa*. SP. *Arcaneta*. PORT. *Alcanna Bastarda*. RUS. *Wolowoi jasiuk*. POL. *Czerwieniec*. LAT. *Alcanna spuria seu vulgaris*.) grows naturally in the Levant ; the flowers grow in long spikes, coming out imbricated, like the tiles of a house ; it may be propagated by seeds, which should be sown either in the spring or autumn, upon a bed of light sandy earth, and plants transplanted at two feet distance from one another. The root imparts an elegant red colour to oily substances, and is therefore an ingredient in ointments, plasters, &c. It improves the colour of mahogany. That which grows in England is greatly inferior to what comes from abroad.

ALLAY. See **ALLOY**.

ALLEGATION, is used in common parlance as synonymous with alledgement, or matter alledged. The Respondent Latin word signified, among the Romans, the verification of any instrument signed by the emperor. It means, in some civil proceedings, the producing of instruments to authorise some act.

ALLEGEAS, a stuff manufactured in the East Indies, sometimes of cotton, sometimes of a vegetable which is indigenous, and is spun like flax or hemp.

ALLEGIANCE, the legal faith and obedience which every subject owes to the sovereign authority of the state. In these kingdoms, this oath has been altered in form at many different times. At the revolution of 1688, the period at which we date our present constitution, the old oaths of allegiance imposed by statutes 1 Eliz. and 3 Jac. 1. were abrogated, and a new one substituted. The last of these was prescribed by 1 Geo. 1. c. 13., and is nothing more than as follows : — " I, A. B., do sincerely promise and swear to bear true allegiance to His Majesty King George, so help me God." Anciently, in England, every male above twelve years of age was required to take the oath of allegiance, and it was a high contempt to refuse.

Allegiance is either perpetual or temporary. Perpetual to all who are natural-born subjects, or naturalized by an act of the state ; temporary to all persons who are not natural-born subjects, but who are residing under the protection of the laws.

Quakers alone are exempt from the obligation of taking the oath of allegiance, and are permitted in lieu thereof to make a simple declaration of fidelity. 8 Geo. 1. c. 6.

ALLEVEURE, a small brass Swedish coin, worth about $\frac{1}{4}$ d. English money.

ALLEY, from the French word *Aller*, to go, signifies a narrow street, path, or passage. It is metaphorically used in the modern husbandry for the space which is left between the parallel rows of corn.

ALLIGATION, is a rule or operation whereby questions are resolved relating to the mixture of divers commodities or ingredients together, with the value, effect, &c. thereof in composition.

ALLOCATION, denotes the admitting or allowing of an article of an account, especially in the exchequer. Hence *Allocatione Faciendâ*, is a writ directed to the Lord Treasurer, or barons of the Exchequer, commanding them to allow an accountant such sums as he has lawfully expended in the execution of his office.

ALLOTING, or **ALLOTMENT** of goods, is when a ship's cargo is divided into several parts, bought by divers persons, whose names are written on as many pieces of paper, which are applied by an indifferent person to the several lots or parcels; by which means the goods are divided without partiality.

ALLOWANCES to bankrupts out of their estates. See **BANKRUPTS**.

ALLOWANCES made to the discoverers of bankrupts' effects. See **BANKRUPTS**.

ALLOWANCES made at the Custom-house on merchandize, &c. See **DUTIES**, &c.

ALLOY, or **ALLAY**, properly signifies a proportion of a baser metal mixed with a finer one. The alloy of gold is estimated by carats, that of silver by pennyweights. In different nations, different proportions of alloy are used; whence their monies are said to be of different degrees of fineness, or baseness, and are valued accordingly in foreign exchanges.

The chief reasons alledged for the alloy of coins are, 1. The mixture of the metals, which, when smelted from the mines, are not perfectly pure. 2. The saving the expence it must otherwise cost if they were to be refined. 3. The necessity of rendering them harder, by mixing some parts of other metals with them, to prevent the diminution of weight by wearing in passing from hand to hand. 4. The melting of foreign gold or coin which is alloyed. 5. The charges of coinage, which must be made good by the profit arising from the money coined. 6. And lastly, The duty belonging to the sovereign, on account of the power he has to cause money to be coined in his dominions. In a more general sense, the word is employed in chemistry, to signify the union of different metallic matters; whereby their density, specific gravity, and other properties are capable of being changed.

Whether gold or silver be above or below

standard, is found by assaying. See **AS-SAY**.

ALLSPICE. See **PIMENTO**.

ALLUM. See **ALUM**.

ALMADIE, or **ALMADY**, a kind of African canoe or small vessel, about four fathoms long, commonly made of bark. *Almadie*, is also the name of a kind of long-boats, fitted out at Calicut, which are 80 feet in length, and 6 or 7 in breadth: they are exceedingly swift, and are otherwise called *cathuri*.

ALMAGRA, a fine deep-red ochre, with some admixture of purple, very heavy, of a dense, yet friable structure, and rough dusty surface. It adheres very firmly to the tongue, melts freely and easily in the mouth, is of an austere and strongly astringent taste, and stains the skin in touching. It is the *sil atticum* of the ancients. It ferments very violently with acids, which distinguishes it from the *sil syricum*: there are large quantities of it in many parts of Spain. It is used in painting and in medicine as an astringent.

ALMANACK, a book or table, containing a calendar of days and months, the rising and setting of the sun, the age of the moon, the eclipses of both luminaries, &c. Their authority is so far recognized by the law of England that they may be judicially taken notice of, and the fact of a certain event having taken place on a particular day may be ascertained by reference to the almanack. 3 *Black. Com.* 333. Almanacks of all kinds, those annexed to the book of common prayer only excepted, are subjected to a stamp duty; and every person selling one unstamped, on conviction before one justice, on the oath of one witness, is to be committed to the house of correction for not exceeding three months. And any person apprehending such offender, may take him before a justice, and on producing a certificate of the conviction, shall be entitled to receive 20s. from the receiver-general of the stamp duties. 30 *Geo. 2. c. 19.* 44 *Geo. 3. c. 98.*

ALMENE, an Indian weight of about 2lb. used on that coast for weighing saffron.

ALMOND, a Portuguese measure for oil; an *almond* is equal to four gallons and a half, and 26 almonds make a pipe.

ALMONDS, (*GER. Mandeln. DU. Amandelen. DA. Mandler. SW. Mandlar. FR. Amandes. IT. Mandorle. SP. Almen-dras. PORT. Amendoas. RUS. Mindal. POL. Migdal. LAT. Amygdala.*) a kind of medicinal fruit, contained in a hard shell, which is inclosed in a tough cottony skin. The tree which produces this fruit, nearly resembles the peach both in leaves and blossoms; it grows spontaneously only in warm countries, as Spain, and particularly Barbary. It flowers early in the spring, and produces fruit in August. *Almonds* are of two kinds, sweet, and bitter; the Jordan

almond is of the first quality; next the Valencia, (a smaller sort of about half the price,) and the inferior almonds are from Barbary, whence principally come the bitter ones. From the port of Malaga in Spain come the finest almonds, both in the shell, as well as the kernel. In medicinal cases, the oil drawn from almonds is found useful; and that extracted from the bitter one, if dropped into the ear, proves good against deafness. Almonds are imported in casks, boxes, and serons. For *Oil of Almonds*, see title OIL.

ALMONDS, among lapidaries, signify pieces of rock crystal, used in adorning branch-candlesticks, &c. on account of the resemblance they bear to the fruit of that name.

ALMOND-FURNACE, among refiners, that in which the slags of litharge, left in refining silver, are reduced to lead again by the help of charcoal.

ALMOXARIFARGO, is a duty paid *ad valorem* on the exportation of hides from South America in European vessels, to the king of Spain.

ALNAGE, or AULNAGE, from the French *aune* or *alne*, an ell, the measuring of woollen manufactures with an ell. As a proof of the goodness of such commodities, a seal was invented, and affixed as a mark that the articles were made according to the statute; but, it being now possible to purchase these seals, they are affixed, whenever the vender pleases, to all cloths indiscriminately, to the great prejudice of woollen manufactures.

ALNAGER, ALNEGER, or AULNEGER, q. d. *Measurer by the ell*, signified a sworn public officer, who by himself or deputy was to look to the assize of woollen cloth throughout the land, as to the length, width, and work thereof; and also to the seals for that purpose ordained. The office of king's alnager seems to have been derived from the statute of Richard I. in the year 1197; but this office was abolished by the statute 11 & 12 W. III. cap. 20.

ALOES, (GER. DU. DA. SW. IT. and LAT. *Aloe*. FR. *Aloes*. SP. *Aloe*, *Acibar*. PORT. *Aloes*, *Azevre*. RUS. *Sabir*. POL. *Aloe*, *Aloa*.) is the inspissated juice of the plant *aloe*; an article usually mentioned in common parlance, as if it consisted of fruit or berries, and always therefore used as a plural. It is, however, an inspissated juice of a plant, produced in many of the hot climates. There are many different kinds, but for our purpose here it is only necessary to distinguish three.

1. The *socotorine*, vulgarly contracted into *succatrine*, is a native of *Socotara*, an island in the Arabian sea. This we obtain from the Levant principally, being brought in skins. It is the juice expressed from the leaves of the plant, boiled till it becomes of a proper consistency, then poured into earthen pots,

where it remains several months, and lastly is transferred to the skins for sale. This sort is, to a certain degree, transparent, inodorous, and of a yellow colour when broken.

2. The *hepatic*, so denominated from its liver colour. This kind is resinous, smells like myrrh, and is produced in China, but imitated in many other countries; among the rest, in the West India Islands, and in part of America.

3. The *horse aloes*, so denominated from its excessive coarseness, being only adapted to the use of horses and other cattle, and more technically known by the name of *caballine*. This sort comes principally from Jamaica and Barbadoes, in both of which islands large quantities are prepared, and generally conveyed in the shells or skins of large gourds.

The general nature of all these is the same, their particular differences consisting in the different proportions of gum to their resin; and in their colours and flavours.

The *socotrine* contains less than half the quantity of resin or sulphurous matter, and about a third more of saline substance than the *hepatic*. By these differences in their constituent parts, their applications in pharmacy are directed. The *socotorine* is the only proper kind for internal use. The *hepatic*, being more resinous, is more applicable to external purposes, as cuts and wounds.

The *caballine* is used both externally and internally for horses and cattle of all kinds; but is at best a very coarse medicine, even for them, and should, at all events, be corrected in its proximate effects, by an admixture of warm spices.

ALOES WOOD. (GER. *Aloeholz*. DU. *Aloëhout*, *Paradyshout*. DA. *Aloetræ*. SW. *Aloetrå*. FR. *Bois d'aloes*. IT. *Legno di Aloe*. SP. *Aloe chino*. PORT. *Pão de Aloes*. RUS. *Aloe derewo*. POL. *Aloe drzewko*. LAT. *Lignum Aloes*.) The *aloe-wood* is the product of the *excaecaria agalloca*, a tree growing in China, and some of the Indian islands. There are three sorts, viz. the *calambac* or *tambac*, the common *aloe-wood*, and the *calambour*.

1. The *calabac*, or finest *aloe-wood*, is of a light spongy texture, very porous, and its pores so filled up with a soft and fragrant resin, that the whole may be pressed and dented by the fingers like wax, or moulded about by chewing in the mouth, in the manner of mastich. Its scent is very fragrant, and its taste acrid and bitterish, but very aromatic and pleasant. It is very variable in its colour; some variegated with black and purple, some with black and yellow, and some yellow alone, like the yolk of an egg.

2. The common *aloe-wood*, or *lignum aloes vulgare*, is the second in value; this is of a more dense and compact texture, and consequently less resinous than the other. It

is in small fragments of a dusky brown colour, variegated with resinous black veins. Its smell is very agreeable, but not so strongly perfumed as the former sort; its taste is somewhat bitter and acrid, but aromatic.

5. The *calambour*, called also *agalocolum sylvestre*, and *lignum aloes mexicanum*, is light and friable, of a dusky green, black, and deep-brown colour, and often mottled. Its smell is fragrant and agreeable, but much less sweet than either of the two other sorts; its taste bitterish. It is to be met with in large logs; and is used by cabinet-makers and inlayers.

The two first of those aloes are used in medicine as a cordial. A very fragrant oil may be produced from them by distillation, recommended in paralytic cases. It is the general opinion that these three sorts of aloes-wood are produced by one tree, the *calambac* or *tambac* being the heart of the trunk.

ALOOF. See **LUFF**.

ALPHABET, the several letters used in any language, disposed in their proper order. The word is derived immediately from the names of the two first letters of the Greek language, viz. *alpha* and *beta*. We reckon 26 letters in the English alphabet; the French have only 23; the Dutch 26; the Spaniards 27; the Italians 20.

The Chinese can scarcely be said to have an alphabet, for their language is hieroglyphical, where each character or symbol stands for a whole word, and therefore these are as numerous as the things to be represented, or ideas to be expressed.

ALPHABET, among merchants and traders, is a kind of index with the 26 letters in their order, in which are arranged the names and surnames of those with whom open accounts are kept, and which refers to the folio of the ledger where those accounts are written, in the form of debtor and creditor, serving to find with facility such accounts as are necessary to be turned to.

ALPHOENIX, the white barley sugar; it is made of common sugar, which is boiled until it becomes easy to crack, when it is poured upon a marble table greased with oil of sweet almonds, and moulded into various figures with a brass crotchet.

ALQUIER, is both a liquid and dry measure in Portugal. See **WEIGHTS AND MEASURES**.

ALQUIFOU, or **ARQUIFOU**, a sort of leaden ore, which, when broken, looks like antimony. It is used by the potters to give a green varnish to their works, and thence is called potters'-ore. It is met with in Cornwall, &c. The potters mix a small portion of manganese with the alquifou, and then the varnish or glazing of their ware is of a blackish hue. For the foreign names of this article, as well as for further informa-

tion respecting glazing, see **POTTERIES**, and **POTTERS' ORE**.

ALTIN, a money of account in Muscovy, worth three copecks; 100 of which make a ruble, worth about 4s. 6d. British money.

AL TOM, a name given in Hungary to the coin called a *sequin*, when stamped with the Turkish monarch's stamp.

ALUDEL, in chemistry, are earthen pots without bottoms, inserted into each other, and used in sublimations.

ALUM, (GER. *Alaun*. DU. *Aluin*. DAN. *Allun*. SW. and FR. *Alun*. IT. *Allume*. SP. *Allumbre*. PORT. *Pedra hume*. RUS. *Kwasszi*. POL. *Halun*. LAT. *Alumen*.) a mineral substance composed of a peculiar earth termed *alumine*, and sulphuric acid; that sold under the name of common alum, contains a portion of potash and ammonia. Most of the alum to be met with is artificially prepared. The purest is that manufactured at La Tolfa, near Civita Vecchia, in the Roman state. The ore made use of is the *alaunstein* or *alum-stone*, of the Germans, which is procured about a mile from the place where it is made. This, called Roman alum, is usually met with in small crystals, and has a reddish colour. It may be deprived of its colour by being re-dissolved and crystallized.

Native alum is found at Göttwig in Austria, in Carinthia, in the clefts and caverns on Stromboli, the Solfatara near Naples, the Grotto of San Germano, Misenio, and other places in Italy. This differs from alum artificially prepared, in containing a greater quantity of aluminous earth and a portion of iron.

This salt is extremely useful in the art of dyeing, as by means of it a great number of colours are fixed and rendered permanent upon cloth, which otherwise would not adhere in any degree, or only for a very short time. It constitutes the basis of crayons, which generally consist of the earth of alum finely powdered and tinged for the purpose. In the preparation of Prussian blue, it prevents the iron contained in the sulphate of iron used, which is soluble in acids, from being precipitated by the superfluous alkali employed in the preparation of that pigment; that is, the alkali which is not coloured by the saturating matter. It is also of use in the making of candles, increasing the hardness of the tallow. Wood sufficiently soaked in a solution of alum does not easily take fire; and the same is true of paper impregnated with it, which for that reason is very properly employed in preserving gunpowder, as it also excludes the moisture of the air. Paper impregnated with alum is useful in whitening silver and silvering brass without heat. Alum is also of use in tanning, where it assists in restoring the cohesion of the skins almost entirely destroyed by the lime. Vintners use it for

fining their wines; and it is employed in the salting of fish to dry them. It is of various uses in medicine as a styptic and astringent. The *aluminous mordant*, so much employed by calico-printers, is *acetite of alumine*, and is prepared by adding gradually a solution of common alum in rain-water, to a solution of pearl-ash, or any other sufficiently pure alkali, till the liquor is just on the point of becoming turbid, in order to saturate the excess of acid in common alum. A cold saturated solution of acetite of lead in rain-water is then to be stirred in as long as any precipitation takes place. A double chemical decomposition here takes place, as acetite of alumine and sulphate of lead are formed, the latter of which being insoluble in water, subsides, and the supernatant liquor, containing the acetite of alumine in solution, may then be drawn off by a syphon. By gradually evaporating it, and then setting it aside to cool, small needle-shaped crystals are formed, which are exceedingly deliquescent, and by a heat inferior to that of boiling water, they are deprived of the acetic acid.

ALUM Works, places where alum is prepared and manufactured in quantities for sale. They differ from alum mines, as in the former an artificial alum, and in the latter natural alum, is produced.

AMADOW, (Fr. *Amadou*. GER. *Zunderschwamm*.) a kind of tinder or touchwood coming from Germany. It is a kind of mushroom or spongy excrescence, which grows on old trees. This substance is boiled in common water, and afterwards dried and well beaten, then put in a strong ley, prepared with saltpetre; after which it is again put to dry in an oven.

AMAIN, in the sea language, a term importing to lower something at once. Thus to *strike amain*, is to lower, or let fall, the topsails; to *wave amain*, is to make a signal by waving a drawn sword or the like, as a demand that the enemy strike their topsails.

AMALGAM, a word derived immediately from the Greek language, and signifying simply a *joining together*. It is used exclusively in chemistry, (except, indeed, sometimes metaphorically in colloquial language) to signify an alloy of metallic metal with mercury.

AMALGAMATION, the operation of making an amalgam, or mixing mercury with any metal. For the combination of any one metal with another, it is generally sufficient that one of them be in a state of fluidity. Mercury being always fluid, is therefore capable of amalgamation with other metals without heat; nevertheless, heat considerably facilitates the operation. To amalgamate without heat, requires nothing more than rubbing the two metals together in a mortar; but the metal to be united with the mercury, should be pre-

viously divided into very thin plates or grains. When heat is used, which is with some metals indispensably necessary, the mercury should be heated till it begins to smoke, and the grains of metal made red hot before they are thrown into it. If it be gold or silver, it is sufficient to stir the fluid with an iron rod for a little while, and throw it into a vessel filled with water. This amalgam is used for gilding or silvering of copper, which is afterwards exposed to a degree of heat sufficient to evaporate the mercury. Amalgamation with lead or tin is effected by pouring an equal weight of mercury into either of these metals in a state of fusion, and stirring all with an iron rod. Copper amalgamates with great difficulty, and iron not at all.

AMAN, a sort of blue cotton cloth, which comes from the Levant by the way of Aleppo.

AMANUENSIS, signifies a clerk or secretary who writes, by the special direction of another, what that other dictates. It is derived from the Latin word *manus*, a hand.

AMBASSADOR, or **EMBASSADOR**, a public minister sent from one sovereign prince, as a representative of his person, to another. Ambassadors are either ordinary or extraordinary. Ambassador *in ordinary* is he who constantly resides in the court of another prince, to maintain a good understanding, and look to the interest of his master. Ambassadors *extraordinary*, are such as are sent on some particular occasion only, and who retire as soon as that is accomplished. By the law of nations, none under the quality of a sovereign prince can send or receive an ambassador. Ambassadors should never attend any public solemnities, as marriages, funerals, &c. unless their masters have some interest therein; nor must they go into mourning on any occasions of their own, because they represent the person of their prince. By the civil law, the moveable goods of an ambassador, which are accounted an accession to his person, cannot be seized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgment, nor by the king's or state's leave where he resides, as some conceive; for all actions ought to be far from an ambassador, as well that which toucheth his necessities as his person: if, therefore, he hath contracted any debt, he is to be called on kindly; and if he refuses, then letters of request are to go to his master. Nor can any of the ambassador's domestic servants that are registered in the Secretary of State's office be arrested in person, or goods, by stat. 7 Ann. cap. 12. A. D. 1708., an act passed on a particular occasion, for preserving the privileges of *ambassadors*, and *other public ministers*, of foreign princes and states, for protecting their property from

being seized on, also the persons of the ambassadors as well as their domestics from arrest by writ, execution or otherwise, and for punishing any person or persons who may attempt to sue or molest them. But by sect. 5. no merchant (*who comes within the bankrupt law*) and puts himself into the service of an ambassador, can receive any benefit from this act. No person can be punished for arresting the servant of an ambassador, unless the name of such servant be first registered in the office of one of the principal Secretaries of State, and by such Secretary transmitted to the Sheriffs of London and Middlesex, for the time being, or their under-sheriffs and deputies, who shall, upon the receipt thereof, hang up the same in some public place in their offices, whereto all persons may resort, and take copies thereof, without fee or reward. 1 *Bl. Com.* 256. But this registering is not a condition, precedent, &c. to ambassadors' servants being entitled to the privileges given, but is merely an indemnity to a bailiff arresting prior to such registry. *Heathfield v. Clinton*, 4 *Burr. Rep.* 2017., and *Hopkins v. De Roebeck*, 3 *Term R.* 79. How far a consul comes within the description of "a public minister," see *Clarke v. Critico*, 1 *Taunt. R.* 106.

AMBER, (*Succinum*.) (GER. *Bernstein*. DU. *Barnsteen*. DA. *Bernsteen*, Rav. Sw. *Bernsten*, Raf. FR. *Ambre jaune*. IT. *Ambra gialla*. SP. *Ambar*. POR. *Ambar*, *Ambré*, *Alambre*. RUS. *Jantar*. POL. *Bursatyn*. LAT. *Succinum*, *Electrum*.) This is a pellucid and very hard inflammable substance, of one uniform structure, a bituminous taste, very fragrant smell, and highly electric.

The generality of authors contend for this substance being a bitumen, which trickling into the sea, from some subterraneous sources, and then mixing with vitriolic salts, that abound in these parts, becomes congealed and fixed. However, as good amber is found by digging a great distance from the sea, it is probable that it is a bitumen of the naphtha or petroleum kind, hardened into its present state by union with oxygen or acids.

The natural colour of amber is a fine pale yellow, but it is often made white, and sometimes black; in both cases it is rendered opaque by the admixture of extraneous bodies. The most frequent variation, however, from the yellow, is into a dusky brown; sometimes it is tinged with metal-line particles, and remains pellucid. The salt, oil, and tincture of amber, have been variously applied in medicine; but its mechanical uses for toys, beads, cabinets and utensils, and the better sorts of varnishes, are of more importance.

This substance is principally to be met with on the sea-coasts of Prussia. The river Giaretta in Sicily, formerly called Simetus, which takes its rise on the north side of

Mount Ætna, throws up near its mouth great quantities of fine amber, some of which is more electric, and emits a stronger smell, than what comes from the Baltic. Some pieces of this amber contain flies and other insects, curiously preserved. It is generally supposed to issue from the earth in a liquid state, at which time the insects that alight upon it are caught, and by their struggle to get loose, soon work themselves into its substance; which hardening round them, they are for ever preserved in the greatest perfection. Large fine pieces are constantly found at the mouth of the Simetus, supposed to have been brought down by the river; but it is singular that none of it is ever found but on the sea-shore. This amber at Catania is manufactured into beads, crosses, &c.

AMBERADA, fictitious amber, which the Europeans use in their trade with the negroes on the coast of Africa, particularly in the river Senegal. There are some large and red pieces of it, 1000 of which making 20 ropes or strings, weight about 3lb.; there are others small, and also red, which weigh about 2½lb.

AMBER-GRIS or AMBER-GREASE, (GER. *Amber*. DU. *Amber*. DA. *Ambra*. SW. *Grå Ambra*. FR. *Ambre-gris*. IT. *Ambra-grigia*. SP. *Ambar-gris*. PORT. *Ambar-gris*. RUS. *Ambra*. POL. *Ambra*. LAT. *Ambra*, *Ambra grisea*.) is a solid, opaque, generally ash-coloured, fatty, inflammable substance, variegated like marble, remarkably light, rugged and uneven in its surface, and has a fragrant odour when heated; it does not effervesce with acids, melts freely over the fire into a kind of yellow rosin, and is hardly soluble in spirit of wine. It is found on the sea-coast, or swimming on the sea, or in the abdomen of whales, in various shapes and sizes, weighing from half an ounce to upwards of one hundred pounds weight.

The colours of ambergris vary; there is first the *white*, which is scarce, and of little value, as it seems either not to be ripe, or mixed with some heterogeneous matter; then the *ash-coloured* or true ambergris; afterwards the *black*, which is inferior to the preceding sort, and frequently adulterated; and lastly, the *brown* ambergris, which has a particularly unpleasant smell. It looks mostly sleek or smooth, as if covered with a skin. It is now pretty well ascertained to be an hardened portion of the fæces of the *Physeter macrocephalus*, or sperma-ceti whale; and the difference in appearance, of that usually sold, arises from its being more or less recent. That which is fresh generally retains a disagreeable odour. It is usually mixed with portions of the beak of the *sepia octopodia*, or cuttle-fish, which is the constant and natural food of that species of whale.

Mr. Homberg found that a vessel in which he had made a long digestion of hu-

man faces, acquired a very strong and perfect smell of ambergris, so that any one would have thought a great quantity of essence of ambergris had been made in it.

Ambergris ought to be chosen in large pieces of an agreeable odour, entirely grey on the outside, and grey with little black spots within. The purchaser should be very cautious, as this article is easily counterfeited with gums and other drugs.

Ambergris is chiefly found in the Atlantic ocean, on the sea-coast of Brazil, of the East Indies, China, Japan and the Molucca Islands; but most of it brought to England comes from the Bahama Islands and Providence.

The use of ambergris is now nearly confined to perfumery; it was formerly recommended in medicine by eminent physicians. In Asia, and parts of Africa, it is used as a spice in cookery.

AMBER-SEED, (GER. *Bisamkörner*. DU. *Muskuszaad*. DA. *Desmerkorn*. SW. *Desmanskorn*. IT. *Granelli d'ambretta*. SP. *Ambarilla*. PORT. *Ambaralhi*. POL. *Ziarka piznowe*. FR. *Ambrette*. LAT. *Abelmoschi grana*.) a small odoriferous seed used as a perfume. It is sometimes brought from Egypt, but is likewise imported from Martinico.

AMBULANT, the name given at Amsterdam to brokers, or exchange agents, who have not been sworn before a magistrate. They transact business like others, but their testimony is not received in the courts of justice.

AMENDMENT, in legal language, signifies the correction of an error committed in any process, which may be amended even after judgment. In very early times, the only way of rectifying the mis-spellings and other mistakes of clerks, in making up records, although no way affecting the merits of the case, was by writ of error, which was expensive and vexatious; wherefore many statutes of the realm were passed to remedy the mischief, by allowing amendments of the records to be made, under the circumstances pointed out by them respectively. Partly by force of these statutes, and partly by the increased liberality of the courts of law, amendment of clerical errors, and all other mere mistakes, are now amendable; or, what is the same thing in effect, the exception against them is prevented; so that, as Blackstone observes, "writs of error cannot now be maintained but for some material mistake assigned." 3 *Black. Com.* 407.

AMERCEMENT, signifies the discretionary pecuniary punishment of any offender against his sovereign, or superior lord, at whose mercy he stands. The difference between *amercements* and *fines* is, that the latter are pecuniary recomences, which are by some means or other defined, limited, and certain; while the former are entirely

discretionary. The most ordinary colloquial application of the term now, is to the fines set upon persons presented at manorial courts for nuisances.

AMERICA, one of the four divisions of the globe into continents, and much the largest. It is probably bounded entirely by the ocean, though the north-east part of it approaches so near to an extremity of Asia, within the Arctic circle, that it has been long a matter of doubt whether the two continents be entirely separated. It is so long, as to extend over, not only the torrid, but the temperate, and part of the frigid, zones. A continent so extensive must of necessity be various in its climate, soil, and productions, animal, vegetable, and mineral. It is divided by nature into two parts — North, and South America, which are united by the isthmus of Darien; but is further divided artificially by the governments to which the different portions of it are subject. For our present purpose, it will be best considered under five specific heads, beginning at the southernmost point, and proceeding northward; viz. *Spanish America*, *Portuguese America*, the *United States*, *British America*, and, lastly, the *American Islands*, under various governments, commonly denominated the *West Indies*.

The aboriginal olive-coloured inhabitants, who are now reduced to but a few tribes, and inhabit the interior, do not stand sufficiently prominent for commercial notice under any designation; because, though furs, and other items of barter, originate with them, they pass through the hands of the white population, and are considered as articles of commerce under the divisions already projected respectively. The French and the Dutch, indeed, have each a settlement in the province of Guiana, on the coast of the Atlantic Ocean, but they are too inconsiderable in territory to interfere with this distribution.

Spanish America, then, comprehends Chili, Paraguay, Peru, and Terra Firma, on the south of the isthmus; and on the north, Mexico, New Mexico, Albany, California, and (disputed by the United States) the two Floridas. While these provinces continue at war with the mother country, all the import commerce must be as comprehensive as irregular in its nature, and the export in its channels. It is sufficient, therefore, to observe generally, that the province of Chili abounds in gold, silver, tin, copper, quicksilver, and lead. Paraguay, beside the articles just enumerated, has a variety of precious stones: the cotton tree is a native of the country; and wax and honey are abundant. In the province of Peru are the famous mines of Potosi, which produce silver in greater plenty than is to be found in any other part of the world. The town of Potosi is the largest in Peru, and

here is a great mart for all sorts of European commodities, which are easily exchanged for silver. The article of quicksilver was wholly engrossed by the crown, and probably will be by whatever government shall succeed, being necessary for refining the silver. They have, beside, articles for exportation, the tree which yields the Peruvian bark, the balsam of Peru, rhubarb, sarsaparilla, dragon's blood, storax, guaiacum, and many other vegetable productions. While these colonies were under the complete dominion of Spain, the greatest share of their trade was confined to the port of Cadiz, as all vessels passing and repassing on government account were confined to that port. Wines, brandies, iron, steel, and great varieties of linen, from Spain, Germany, and Holland, made the chief articles of export; and it is almost unnecessary to say, that gold and silver, both coined and in bullion, copper, coffee, and sugar, were the principal returns.

Peru has so many fine ports along its coast, that it may be considered the maritime province of all South America. The trade here flows through three channels: by the Straits of Magellan from Europe; through the North Pacific from India and Mexico, or Guatemala; and through the interior with the southern provinces of Chili and Buenos Ayres. Its exports and imports have been doubled within the last 20 years; and the principal branch of its commerce is that carried on round Cape Horn.

The exports of Peru, as has been observed, are chiefly gold, silver, brandies, sugar, pimento, salt, wool, and some coarse woollens. Its imports are most kinds of European goods, especially silks, linens, cottons, and fine woollens; mercury, glass, wax, paper, medicines, wines, books, furniture, &c. From Buenos Ayres it receives tea, live stock, and provisions; from the other internal provinces, indigo, tallow, timber, cordage, pitch, copper, and other articles of less importance.

Chili also supplies Lima with grain and fruits, salted meat, soap, wine, &c.

From the Philippine Islands, muslins, tea, and other Indian articles are imported to the amount of near 300,000 dollars annually, in exchange for gold and silver exported to Asia.

The produce of the mines of Peru and Chili may be about 1,730,000*l.* annually, and agricultural produce exported about 870,000*l.*; while the value of European goods imported is reckoned about 2,500,000*l.* in the same period.

Portuguese America, is washed by the Atlantic Ocean from the River Plata to the River Amazon, a length of more than 2000 miles. It was not discovered by the Portuguese till 1500, and not settled by them to any extent till fifty years after-

wards. It has now become so populous and powerful, that from having been only a colony of Portugal, it has become the seat of government, and the residence of the royal family; and it is thought by most well-informed persons must either continue so, or become independent; especially after the example that has been set by the other portions of this continent.

The kingdom is divided into several provinces, not less, we believe, than sixteen; but it is unnecessary to notice these divisions further than by observing, that the city of St. Salvador, or Bahia, is the great mart of commerce. It is situated on the bay of All-Saints, nearly midway between the two extremities of the coast that acknowledges the sway of the Brazilian monarch. It is a large, well-built populous town, situated on a great eminence above the port, in a fine climate, and continually refreshed by the breezes from the sea; nearly impregnable if properly defended. It is a place of great trade, although the town is on an inconvenient eminence above the port. Rio de Janeiro, situated on a river of the same name, about two leagues from the main ocean, and to the southward of Bahia, is the residence of the royal family, and seat of government, and of great mercantile importance. It was formerly known more commonly by the name of St. Sebastian. It has an admirable port, well guarded, and is much resorted to on account of the gold and diamond mines being in its neighbourhood. The royal mint is here, as well as manufactories of sugar, rum, and cochineal. There is also a dock, magazines, and naval storehouses. Fernambuco is another great commercial town, about as much to the northward of Bahia, as Rio is to the south, and considered as even more inaccessible than the other two. There are many other towns of considerable size in the Brazils, as St. Vincent, Belem, and Merignano, but of little commercial importance compared with those which have been noticed. More sugar is exported from this country than from all parts of the world, beside cotton-wool of the finest quality, tobacco, maize, or Indian corn, all the fruits of the tropical climates, woods of various kinds, medicinal drugs in prodigious numbers, gold, and diamonds, with several other precious stones. Their imports are almost beyond numeration; light woollens and linens of all kinds and descriptions, thread, and lace of both thread and cotton, as well as silver and gold; hats, stockings of all sorts, ale, porter, wine, spirits, books, boots and shoes, fire arms, music and musical instruments of all sorts, wheat, barley, meal, biscuits, nails, cutlery, and, in short, almost every European commodity not inapplicable to a warm climate. The Brazil sugar is of a remarkably fine and white kind, and the tobacco admirable, indeed so superior, that the Africans will scarcely trade for any

other. There are prodigious numbers of cattle, which are slain for their hides and their tallow only, and make a great article of commerce. They also export bark, coffee cotton, indigo, rice, and several medicinal drugs.

The revenues of the government principally arise from a fifth part of all the produce of the diamond mines, and from the duties of customs on merchandize. The most strict and rigid precautions are therefore used respecting both, to prevent imposition.

The Portuguese and Spanish monies are current through the whole of the Brazils, the copper ones being received for an augmented value.

Accounts are kept in milrees and rees.

The *United States* are increasing in size, wealth, and importance, every day. It is beside our purpose, however, to notice the commerce of those additional territories which have only been recently admitted to a participation in the government as parts of the federal union, because districts newly inhabited, and imperfectly cultivated, have yet no determinate commercial character; and, however flourishing in promise, can be of little present importance beyond the limits of the government to which they are attached.

Maize or Indian Corn, is the growth of, and highly favoured by, the climate of the *United States*; its ordinary produce is about 25 bushels φ acre. It does not so quickly ripen in New England, as in other parts of the American continent, because the heats there are comparatively of short duration. The maize of Virginia is flat and white, yields very fair flour, and is of an excellent quality; that of New England is of a pale yellow, small and thick. It is well adapted as fodder for oxen, pigs and other beasts. In the American Islands, two crops of maize are annually reaped, the first is sown in May, and the second in September. On the continent there is but one annual crop, which is sown in the month of May.

The states where the culture of corn, and the manufacture of flour, are most considerable, are, New England, New York, Virginia, New Jersey, and Pennsylvania. The *wheat* of New England is heavier than maize; a bushel of the latter weighs about 45lb. and one of the former 55lb. The corn of Virginia is not sown thickly, because in springing up, it extends considerably; it is quite white. In New England it is generally of a pale yellow, yields fewer ears than that of Virginia, but grows more quickly. The corn of Virginia, when sown in New England, does not grow to such perfection, because it is a longer time in coming to maturity, than is consonant with the climate of the last-mentioned state. Immense quantities of corn, both of wheat and rye, are now exported from the Ame-

rican States, especially to Great Britain, and it is even an increasing trade.

The lands which produce *rice* are more numerous, and more fertile in North America, than in any other part of the world; upon the whole of the coast, from the bay of Delaware, as far as the Gulph of Mexico, there is one continued tract of rice-fields, unbroken only by a few patches of sterile sands. The rice-fields, or marshes of Virginia alone produce more rice than serves for the consumption of all Europe and America besides. Heretofore the lands of Carolina could not furnish a sufficient quantity of rice for the consumption of their own inhabitants, and for some time they remained uncultivated, (the same occurred in some parts of Georgia and Florida,) but now this grain thrives well, and supplies not only Carolina itself, but other parts of America, and even Europe.

The American beef is esteemed good in the islands, when it has had a quick passage; but as soon as the barrels are opened, it must be used without delay, otherwise it would putrify. The people of Massachusetts salt some beef for exportation, and for ships' use, but it is of a quality far inferior to that of Ireland, nor is it by any means so well cured as the latter. There is scarcely any in Virginia. The beef of the southern provinces of Pennsylvania is not good. Connecticut furnishes more of this article than all the other American states. The provinces to the southward consume very little salted beef; they have but few vessels to victual, and they feed their slaves with maize and rice; they however export a small quantity of the article. Large herds of thin and diminutive beasts are to be found in the back parts of the Carolinas and Georgia; they are wild, and live in the woods; the bringing of them up is attended with no expence, on account of the mildness of the winters. The inhabitants feed those beasts, which they intend for their own consumption, in inclosed pastures; those of the woods are generally fat about the month of October. Wild oxen, if they be lean, are sold at a guinea and a guinea and a half φ head to the Pennsylvanians, who fatten them for the Philadelphia market. The want of an opening for exportation trade may probably be the cause of the little improvement which has taken place in the race of oxen in the back settlements of Carolina and Georgia, the inhabitants of which turn their attention chiefly to the cultivation of rice, indigo, tobacco, and maize.

The *Burlington pork* is very good; the hams though lean are well-flavoured; great quantities are sent to the islands. The people of Carolina bring up so great a number of pigs, and feed them at so small an expence, that pork is to be had there on far better terms than either in England or Ire-

land, but it is not so good, neither does it keep so well.

Very little *butter* is sent from America to the Antilles; it is quickly tainted, when exposed to the air; and as the same may be said of the beef, it is probable that neither one or the other will become a considerable article of commerce. The states to the southward, even at the present day, draw small quantities of butter, soap and candles from England and Ireland.

Bees are to be seen in vast swarms in all the forests in the New World; their numbers experience a daily increase, and their honey is turned to different uses; many of the Indian nations use it as an article of food. Their wax becomes every day more and more valuable to the revenue of the colonies. At the present period it is an object of great commercial importance to the United States.

Not only the skins of beavers, otters, pole-cats, rats, foxes and martens, but likewise those of deer, rein-deer and elks, are the produce of America. The animals of the two last-mentioned species, which in our hemisphere are only found towards the polar circle, in the New World, are to be found in lower degrees of latitude, partly by reason of the cold being sharper in America, and partly because that part of the world is more thinly inhabited. The American skins, though strong, are soft, pliant, and light.

Of all the countries where the culture of *tobacco* has been attempted, there is not one in which that plant has thriven so well as in America, but particularly in Maryland and Virginia. The original colonists principally employed themselves in advancing the growth of tobacco, the plantations of which have spread in proportion to the sale of the article in Europe. The Virginian tobacco is chiefly consumed in England and France; that of Maryland, otherwise *Oroonoko*, is exported to Holland and Germany.

Cotton, of a very excellent quality, is grown in great abundance in all parts of the United States, from Maryland to South Carolina and Georgia, and some is even cultivated in the northern colonies. This cotton is somewhat similar to that of Smyrna; it keeps very well when housed, though not so well as that of the East Indies; it is, however, whiter, and preserves its hue better than the latter, which not unfrequently turns yellow.

Indigo is grown in small quantities, but is of a quality far inferior to that of the French, Spanish, and Portuguese colonies. What is cultivated upon the banks of the Mississippi, is from 20 to 25 per cent. superior in value to that of Carolina, and the produce of each acre of the latter is nearly double that of the former.

The *wool* of North America has not been in equal estimation to that of England, and has not been considered among the articles

of export; beside that they have wished to encourage the manufacture of it at home. Of late, however, it has been discovered that the sheep of the northern provinces produce a wool very little inferior to the fine wools of this country, and the Americans have discovered also that they can import the cloths and stockings of England at less expense than they can manufacture them at home, since the return of peace. Mutton is a meat almost held in abhorrence by the Americans, which has doubtless been a principal occasion of the breed of sheep being little attended to; but it is probable that since the Europeans have discovered this value in some of the American wool, and its susceptibility of improvement, that it will become an article of attention, and of export.

The United States produce in great abundance every article which comes under the denomination of naval stores, of as good, and in some respects better qualities than those which are the produce of the northern countries of Europe; such are masts, yards, all sorts of wood fit for naval purposes, rosin, from which are made pitch and tar, but above all, hemp, &c. American wood is not durable; for the ships built with it do not last so long as those which are built of European oak.

Potash, which is made from the ashes of burnt wood, is an article of considerable commerce between America and England, which latter used formerly to import most of her potash from Russia to the amount, annually, of 120,000*l.* sterling.

By an act of Congress of March 1817, commonly known by the name of "the American Navigation Act," British vessels are prohibited from bringing to the United States any articles other than those the produce of some part of His Majesty's dominions, under pain of forfeiture of ship and cargo.

By other acts of the same session, the duties on almost all articles imported are augmented and regulated. By one of them, wines and spirits are allowed to be bonded for twelve months. The provisions of these acts are exceedingly numerous and very long, inasmuch as to render it impossible to enter upon them more fully here. They are also very heavy in every instance wherein they look forward to the establishment of manufactories within their own territories. These prohibitory provisions, however, have been modified by an act passed in April 1818. See *Pope's Laws of Customs*.

The particular articles, which the above enumerated import duties are designed to protect, are principally distributed as follows.

In the state of *Massachusetts* there are manufactories of potash; iron foundries, in which bar and cast iron, cannons and musket barrels are fabricated; clock work, cutlery, inlaid work, linseed and train oil,

cotton and woollen stuffs, linen cloth, candles made from wax and spermaceti, stockings, hats, shoes, wool cards, tobacco, all sorts of hortulan and agricultural implements, tools of every description, pins, needles, &c. The town of Lynn is particularly famed for the manufacture of women's shoes, made from silk and other stuffs. Salt works are established at Yarmouth, a cotton manufactory at Beverley, and one of glass at Boston.

The manufactures of *Connecticut* hold the first rank amongst those of the United States. There is a woollen manufactory at Hertford; one of linen at Newhaven, forges at Norwich, Salisbury, and other parts of this state. At Stafford an iron mine furnishes the whole state with every needful article made from this metal. There are paper-mills at Norwich, Hertford, Newhaven, and in the county of Lichfield. Nails are made in almost all the towns and villages of the state; there are likewise in several parts of it, hat manufactories and tan yards. Sheffield is distinguished by its wooden works, and the manufacture of culinary and other utensils.

In the state of *New York*, and the city of that name, all sorts of carriage-wheels are made; there are likewise several sugar-houses, bake-houses, porter breweries, and brass founderies in New York; shoes, boots, saddles, cutlery, hats, watches, clocks, paravols, mathematical and musical instruments are also made here. Ships are built and completely fitted out for sea at the city of New York. There are several paper mills in this state.

In the *New Jerseys*, there are forges, tan yards, paper mills, and glass houses in the county of Gloster. In Morris' county there are iron mines; and at Morris-town a gun-powder mill.

In *Pennsylvania* there are iron mines, one of lead, and four of coal, besides manufactories of wool, cotton and silk; and upon the Potomac there is a glass house.

From what has been said of the productions and manufacturies of the United States, a pretty accurate idea may be formed of their principal articles of commercial exports; nevertheless the extent of their territories, and the diversity of articles sent out of, and brought into them, render some statement of the commerce of each state desirable, in order that a just notion may be formed of the traffic of the whole.

New Hampshire. The principal exports of this state are wood, flax seed and salt provisions. The wood is conveyed to Portsmouth, through the rivers Kennebec, Penobscot, and Saco. This commerce usually employs 200 ships. The masts from the interior are very good, and far better than those of the northern parts of Europe. — *Imports.* Almost all the merchandises of Europe find a ready sale here,

Massachusetts. With the exception of wood, maize, vegetables, beasts and birds fit for the Antilles' market, Massachusetts produces few export articles; a great deal of flax is however exported hence for Ireland; its salted beef and pork are very good, and cheaper than those of the last-mentioned kingdom. Skins are furnished by the savages, but in small quantities. — *Imports.* All the merchandises of Europe, India, and the Antilles. Those of England become daily less valuable.

Connecticut. The grain, salt provisions, beasts, birds, and timber of this state are shipped to the Antilles, in a great number of small vessels, which bring back molasses, dollars, and, in contraband trade, sugars and coffee. The industry and frugality of the inhabitants do not offer much inducement to European nations to carry their commodities thither. Ireland draws some flax-seed and masts thence.

New York. Its principal exports consist of corn, flour, peas, rye, maize, salt, flax-seed, biscuits, salt provisions, pot and pearl ash, iron, wood, ship-timber, shingles, pipe-staves, planks, cheese, horses, beasts, wax, and some skins. The flax-seed is principally sent to the Irish market. The other articles are exported to the Antilles, to the southern parts of Europe, to Africa, and even to China. Wax goes hence to Madeira. — *Imports.* Almost the whole of this commerce is carried on from England, which, in addition to a vast number of merchant ships, dispatches a packet boat for the port of New York monthly. The commerce to this port is greater in time of peace than to any other in the United States.

Pennsylvania sends to the Antilles, flour, biscuits, salt beef, pork, maize, wood, barrels, tons, &c. Its flour is also exported in great quantities to Lisbon, Cadiz, Barcelona, Madeira, the Canaries, the Azores, and not unfrequently to England and France. — *Imports.* Philadelphia, as being the staple market of all the commodities of the United States, and above all, of the tobacco of Maryland and Virginia, is a place of considerable importance. It imports all sorts of European merchandise, as well as those of India and the Antilles, which are sold to the neighbouring states, and some of which are even exported with considerable success to New Orleans.

Maryland. The exportations are the same as those of Philadelphia, to which the former is, in some respects, a rival. The principal article of export is tobacco, which is inferior to that of Virginia, because in Maryland the laws with regard to the destruction of bad tobacco, are not so rigorously put in force, as in the other states. The exportation of corn has of late years become considerable. The flour is inferior to that of Philadelphia. — *Imports.* All the European merchandises, as well neces-

saries as luxuries, find a good market in Maryland. The wines and brandy of France are much esteemed and sought after. It is from Baltimore and Philadelphia, that supplies, composed of the merchandises of Europe and the Antilles, are sent to the American settlements, on the other side of the Allegany mountains. They are conveyed to Pittsburgh, whence they are carried down the Ohio.

Virginia. Its exports consist of tobacco, wheat and grain of every description, beasts, birds, vegetables, pork and other salt provisions for the Antilles; wood, pipe staves, shingles, naval stores, gingseng, wax, cotton, potash, and an infinite number of other commodities brought down the country, by means of the rivers which fall into the Chesapeake, whence they are exported to Europe. — *Imports.* Virginia being the richest of the United States, and affording Europe desirable articles for barter, consequently consumes vast quantities of European commodities. England engrosses much of this trade.

Carolina and Georgia export rice, indigo, maize, potash, tobacco, pease, skins, hides, wood, turpentine, tar, pitch, madder, &c. &c. In the latter of these two provinces, every one on the sea-coast is now turning his attention to the cultivation of the sugar-cane, which grows luxuriously, even as far north as Charlestown, in South Carolina; so that it will not be long, probably, before these states will export considerable quantities of this article at a cheaper rate than it can be obtained from our West Indian colonies. This must produce a prodigious revolution in the commerce of Great Britain. In 1812 the United States imported, of sugar, 72,437,56 lb. and exported 13,927,277 lb. For 12 years, ending in 1812, their average consumption was 50,279,249 lb.

Population increases in a more accelerated ratio in the United States of America, than in any other part of the globe, especially in the newly cultivated provinces. Kentucky, which was first settled in 1773, had, in 1792, a population of 100,000, and by the census of 1810, one of 406,511. The whole population of the western territory was, in 1790, reckoned at 6000, and in 1810, the census already mentioned makes that of the Ohio alone 227,843, Tennessee, 261,227, and the remaining parts about 118,000; an increase of 100-fold in 20 years.

Before we conclude this article, it is right to observe, that, under these circumstances of rapid increase in the population of the newly cultivated Western States, it is reasonable to suppose they will, ere long, be much influenced by their local position, and look less to the interests of the Union, than to their personal ones, presented to

their view by the vicinity of the Mexican Gulph as an outlet of their commerce. To them the Atlantic States of the Union are the *Back Country*, arrived nearly at their *acme* of cultivation, as well as population, and too far removed from them to stand in any competition in a commercial point of view, with the prospects which open to them from other quarters. What influence these considerations may have, and within what period they may operate, it is impossible to decide, and not within the design of this work to discuss. But sooner or later, it is according to the common course of nature, to look for a total separation of interests, as well as of governments, between the original States of the Union, and those which have been recently admitted. The artificial wants, and the enterprise required to gratify them, in an advanced state of society, are always reciprocal. On the subject we are now considering, an accelerated impetus appears to be given to the progress of demand and gratification, by an unparalleled concurrence of circumstances, as well of fortune as of nature. An independent government and its consequence, an expanded commerce, are fast rising on the ruins of Spanish monopoly, round the principal portion of the Mexican Gulph; and the river Mississippi, flowing through these recently settled provinces into that gulph, promises to realize to the inhabitants of its banks all the fables of the ancient Pactolus.

The coins of the United States are eagles of gold, worth ten dollars; the dollar of silver; and accounts are kept in dollars, or otherwise in pounds of 20 shillings each.

British America. Canada produces trees and fruits of various kinds: the southern parts beech and red oak. Here are also a species of maple-trees, not, however, in any particular like those of Europe: they yield an excellent and wholesome liquor, more palatable than lemonade, or *eau de cerise*. The other trees, and the fruits peculiar to the southern parts, are ash, elms, linden, nut trees, of two sorts, but whose fruit is worth nothing, chesnut, apple, pear, plum, wild cherry, vines, (which run up the sides of large trees, even to the top, and from which is made a sort of wine, which, when permitted to ferment for a considerable space of time, partakes of the flavour of Canary;) lemon-trees (which produce no fruit), water-melons, limes, wild gooseberries, and pine-apples. Tobacco, also, is among the produce of this southern division. The northern parts have white and red oaks, birch (from whose bark are made canoes), pines (from which runs a sort of odoriferous gum equal to frankincense), firs of every sort, white and red cedar, alder-trees, maidenhair, strawberries and raspberries in abundance. Here are likewise found gooseberries, from which a sort of strong vinegar is made.

The *bluets*, or blue bottles, are small grains, like very small cherries, but black and round; the plant which produces them is about the size of a raspberry bush. There is found in Canada a sort of mastic, or turpentine, which possesses some balsamic qualities.

The southern parts furnish wild beeves, bucks, stags, wolves, lynxes, a species of small tiger, ferrets, rams, ash-coloured squirrels, hares, rabbits, badgers, and beavers, in abundance; white, red, and black bears, musk-rats, crocodiles, and *ossas*, which last are similar in appearance to our hares. The beasts of the northern parts are elks, white foxes, porcupines, martens, pole-cats, black and white bears, flying squirrels, white hares, beavers, otters, musk-rats, squirrels, large stags, and sea-calves or seals.

The birds of the southern parts are chiefly vultures, swans, black geese, black ducks, turkeys, pheasants, red-headed partridges, eagles, cranes, wood-pigeons, parrots, ravens, nightingales, several birds of prey unknown in Europe, as also many small birds, amongst which is that called the fly-catcher. Those of the northern parts are bustards, geese, ducks, of ten or twelve species, magpies, moyaques, which are as large as geese, cormorants, woodcocks, snipes, divers, plovers, herons, partridges, white, black, and red-headed; white ortolans, ravens, vultures, sparrow-hawks, merlins, and wild ducks. The Canadian seas abound in all sorts of fish from the whale to the smelt. The banks of the rivers, of the lakes, and the rivers themselves, abound in all kinds of fresh-water fish and amphibious animals. Shell-fish are to be met with on every part of the shore, particularly muscles, which are of a surprising size. The cod-fishery is chiefly carried on in the bay of Canada, at Saint Peter and Sable island. The fishermen erect frames along the shores upon which they cure the cod. In that part of the river Saint Laurence, where the water is salt and brackish, is caught every kind of fish, but particularly salmon, tunny, shad, trout, lamprey, smelt, conger, mackrel, sole, herring, anchovies, sardines, turbot, and others unknown in Europe. The banks of Newfoundland, Cape Breton, &c. abound in cod-fish, whales, porpoises, and seals. The skins of the seals are exceedingly valuable, being used by hatiers as a substitute for beaver; the oil and bone drawn from the whales are also valuable articles, and hence the English employ numberless ships in the Newfoundland fishery.

There are very capital iron mines in Canada, which are situated in the neighbourhood of the three rivers. About 1000 lb. of ore are daily drawn from them. Near Lake Superior are copper mines, and on the road leading to Quebec a very fine

quarry of slate. On the banks of the River Saint Laurence are found lead mines.

The commerce of Canada has experienced a wonderful increase. The forts which the English have there, are made the *depôts* of those merchandises that are used in the traffic with the savages. The iron, wood, and various kinds of furs which the English draw from Canada, serve as a payment for the wines, stuffs of all sorts, and oils, which they carry thither. Rum, sugar, molasses, and tobacco, come from the English West Indies, for which the Canadians pay principally in furs, which latter they draw from the savages; and in return give them tobacco, rugs, muskets, gunpowder, balls, kettles, hatchets, hardware in general, and those small shells (*cowries*) which pass current amongst the Indians as money. See post FUR TRADE. The chief port of Canada is Quebec.

Nova Scotia is situated to the northward of the United States. This country belonged to the French, who called it Acadia. The colony extends from Cape Sable to the 47° of northern latitude.

After various revolutions, in the course of which the French and English were alternately possessors of the region in question, it finally became the property of the English, to whom it was ceded by the treaty of Utrecht in 1715.

The territory is extremely fertile in corn, pease, fruits, vegetables, and wood, and abounds in beasts and birds of various kinds. The trees which are to be met with in almost every part of the country, consist of birch, beech, maple, and several species of fir. Among the plants we find sarsaparilla, a species of rhubarb, mountain-tea, maidenhair, &c. There are shrubs of various kinds, producing raspberries, strawberries, and small cherries, which latter grow in clusters like our grapes. There is abundance of sassafras; but the most valuable tree in the whole territory is that species of beech known under the appellation of the *sugar-tree*, which yields a substance very similar to the precious commodity wherefrom its title is borrowed.

Among the natural productions of Nova Scotia, we find iron, which is supposed to be as abundant and as good here, as in any other part of the American continent. Lime and chalk are also found in large quantities, and are used both in the construction of buildings, and as manure for the lands; but for the last-mentioned purpose not within reach of the sea breeze, having been found of no use. See post LIME.

The oxen of Nova Scotia are remarkably large, and the sheep are far preferable to those of New England; their flesh, as well as that of the pigs, is indeed excellent. In this country are to be seen the finest dogs in the world, and so wonderful are the strength

and sagacity of these animals, that they are trained by the inhabitants to carry provisions, fire-wood, &c. to their houses, and to do many offices for which servants are employed in other parts of the globe.

The maize of this country is very indifferent, but tobacco thrives exceedingly well.

Among the skins, which constitute a large branch of commerce, the beavers' hold the first rank; the others are those of otters, wolves, lynxes, foxes, &c. &c.

Cod-fish is found upon banks of greater or less extent, adjacent to the coast, at all seasons of the year; and when salted forms an article of first-rate importance. From the middle of April, when the rain dissolves the ice, there is a constant succession of every species of fish in the creeks and bays, till the return of winter. The herring commonly makes its appearance first, the salmon next, and finally the mackerel, whereof vast quantities are exported to the West Indies.

Above 10,000 men are employed in the fisheries. More than 120,000 quintals of fish are taken annually, about 40,000 quintals whereof are exported. Estimating these exports at only 13s. 6d. per quintal, their amount will be 27,000*l.* sterling.

The manufactures consist of a species of home-spun cloth, some stockings, linen, principally manufactured by some Irish settlers; ropes and cordage, loaf-sugar, and iron utensils.

The commerce of Nova Scotia is confined to the exportation of wood, tar, turpentine, fish, some salted meat, a little iron, &c. &c. And in return we send thither much the same description of manufactures as we supply other parts of America with.

Hudson's Bay. The productions of the country adjacent to Hudson's Bay are, of trees, poplars, birch, alders, willows, and all sorts of shrubs. Upon the borders of the lakes and rivers grows much wild rice. In this country are mines of copper, lead and iron, also different species of talc and rock-crystal of divers colours, particularly red and white. Asbestos, which is an incombustible kind of flax, is very common here; also a species of black stone, which separates into thin and polished pieces, and likewise marble, some of which is perfectly white, and some streaked with red, green, and blue. Shell-fish is rare, the fish, instructed by a certain instinct, quitting the shores, upon which they might otherwise be frozen.—The merchandises sent from England to Hudson's Bay, are coarse woollens, leather, cottons, linen, hunting-utensils, fowling-pieces, flints, gunpowder, bullets, shot, cutlasses, salt, flour, oats, rye, peas, beans, malt, salted and dried beef and pork, butter, cheese, biscuits, molasses, steel, manufactured iron, brass, cop-

per, pewter, pipes, tobacco, hosiery, hats, candles, rigging, &c. for ships, mercery, spices, oil, spirits, and wine. The returns are beaver-skins, martens, otters, foxes, wolves, hares, black bears, white bears, seals, elks, and antelopes. Also bed-feathers, whale-fins, some tons of whale-oil, goose-feathers, beaver-wool, elks' hair, and fallow-deers' hair.

In 1670, a charter was granted to a company, for the exclusive trade of this bay. They possess three forts on the southern coast of James' Bay, (by which name the southern part of Hudson's Bay is distinguished,) namely, Rupert, Moose and Albany. On the western side of Hudson's Bay, up the river, is a factory called Flam-borough; and to the northward of this are York, and Prince of Wales's forts.

American Islands (or *West Indies*). Between the two continents of America lie an almost innumerable multitude of islands, commonly denominated the West Indies. Some of them are small and uncultivated, and others of so little importance in the scale of commerce, as scarcely to claim any notice within the design of this work. Those, which from their size, situation, or importance in a commercial point of view, merit insertion at all, are as follow:

Hayti, (formerly *Hispaniola*), as an independent sovereignty, claims precedence. This island lies about 13 leagues to the east of Cuba, and the passage between them is known to mariners by the name of the *Windward Passage*. The length of this island is about 400 miles, and the breadth about 100. Although the climate is hot, it is by no means unhealthy, and is certainly the most fruitful, as well as the pleasanter, of all the West Indian islands, being diversified with hills and vallies, woods and rivers. It has mines of gold, talc, and crystal, and abounds in all the tropical fruits in great perfection, as well as most kinds of timber. It exports sugar, cotton, coffee, rum, wax, honey, ambergris, and various drugs and dyeing woods. It was discovered by Columbus in 1492, and was for a considerable time under the dominion of the Spaniards exclusively, then was divided between the Spaniards and the French, and now has thrown off the yoke of both, and become an independent sovereignty under the dominion of a sable chief. Almost every article which is consumed in Europe is imported into this island, and particular encouragement is given to commerce, especially to that of British subjects. Indeed an agent, a sort of unaccredited ambassador, has resided some time in London, who not only gives every facility to an intercourse with the island, for commercial purposes, but every encouragement to men of science and literature to settle in Hayti.

Cuba, in point of size and importance,

claims the next place among these islands. This island extends 700 miles in length from east to west, but is not more than 70 in breadth. It lies 60 miles to the west of Hispaniola, or Hayti, and commands the entrance of the gulphs of Mexico and Florida, and what is called the Windward Passage. On these accounts, independent of its great fertility, it has always been of the greatest importance to the Spaniards, who emphatically call it the "*key of the West Indies*." The Havannah is the capital, is situated on the north-west coast of the island, and is one of the finest ports in the world, though very difficult of access. It is here that, in September, a Spanish fleet has always met the galleons, and other ships from the continent of South America, and the other islands, for the convenience of returning to Spain in a body. Another town, by name St. Jago, was formerly the capital; it stands on the south-east side of the island, at the bottom of a large bay. Santa Cruz, and Porto del Principa, are two other towns and ports, of some consequence and commerce. The copper-mines here supply the Spaniards almost entirely, and considerable quantities of gold-dust are found in the rivers. All the tropical fruits and trees flourish extremely, and cattle of most sorts, imported originally from Spain, are abundant, inso-much that they are often killed for their hides and fat only, though much of the meat is also salted to victual ships.

Jamaica, the principal of these islands, which is under the dominion of Great Britain, was taken from the Spaniards during the Protectorate of Oliver Cromwell. It lies 30 leagues west of Hayti, or Hispaniola, nearly the same distance south of Cuba, is 170 miles long, and about 70 broad. It is divided into three counties, Middlesex, Surry, and Cornwall; and contains 4,000,000 acres of land. It has many mountains covered with mahogany, and other trees of beauty and value, and several rivers, though none of these navigable for vessels of any size. There are several salt springs in the island, but the fresh water is inferior, and sometimes not plentiful. The climate is fine, but in the autumn subject to violent hurricanes, much lightning, and heavy rains.

St. Jago is the seat of government, but Kingston is the principal town, and the general mart of the island. The port is spacious and fine, for it will admit 1000 ships at a time. No sort of European grain is grown here, and, in fact, maize, and Guinea corn, constitute the whole of the grain raised in Jamaica; large quantities of pease are, however, annually gathered. The fruits are, China and Seville oranges in abundance, lemons, limes, pomegranates, sorb-apples, shaddocks, papas, gustard-apples, guavas, alicada pears, thorny pears, melons, pine apples, &c. &c.

The sugar, cotton, and rum, of Jamaica, are held in the highest estimation, as well as the pimento, commonly known by the name of Jamaica pepper, which is a principal article of culture and of exportation. It produces tobacco, but of a coarse kind. The *lignum-vitæ* is of great importance, both for its wood in cabinet-work, and for its gum, called *guiacum*, a celebrated medicine.

The principal commerce of Jamaica is carried on with Great Britain; very little with other nations, unless clandestinely. The merchandises which England sends thither are linens, bone lace, cambrics, hats, shoes, stockings, cloths, silken stuffs, stationery, soap, candles, butter, cheese, salted provisions, herrings, stock-fish, biscuits, beer, oil, cider, &c. &c.

Barbadoes. The productions of this island are oranges and lemons, from the rinds of which is made citron, and whence is extracted the delicious *liqueur*, "*eau de Barbade*." With regard to the fruit itself, several thousand boxes are annually exported to the English colonies on the continent. The limes which grow here are in excellent repute in England. The other productions are sugar, some indigo, ginger and cotton, in abundance, aloes, &c. &c. which, indeed, form the chief articles of export from Barbadoes. The sugar which is sent hence to England, is finer, but much inferior in quality to that of Jamaica and other islands. Its colour is bluish, probably on account of its being long exposed to the sun. The rum here is far better, and of a less fiery flavour than that of the other islands, on which account, not only in Europe, but in America, it receives a decided preference. The various kinds of wood grown in this island, particularly cedar, are very good. Brigs, shallops, and other small-sized vessels, are built here, and form no inconsiderable branch of the island's commerce. The whole is engrossed by the English, who send thither stuffs, from which are made clothes for the negroes, linens of all sorts, broad cloths, kerseys, raw and manufactured silk, red caps for the slaves, stockings, shoes, gloves, hats, mercery, wigs, pease, beans, oats, biscuit, wines of all sorts, beer, salted provisions, candles, butter, cheese, iron implements for the sugar-trade, lead, powder, balls, brass, &c. &c.

Antigua. The productions of this island are sugar, rum, and tobacco, the export of which articles constitute the whole of its commerce.

Saint Christopher's, commonly called St. Kitt's. The soil of this island is sandy, and therefore well adapted for the culture of tobacco, sugar, cotton, ginger, and all sorts of fruits; the annual produce of the sugar-canes is about 12 or 13,000 hogsheds, and as for every three hogsheds of sugar a puncheon of rum is made, the annual exports of the last article amount to 3 or

4000 puncheons. The valleys and the sides of the mountains are very fertile: they abound in maize, pine-apples, rosemary, plantains, cotton, lignum-vitæ, and various other species of plants, which are totally unknown to us. All sorts of vegetables thrive here, such as musk-melons, water-melons, lettuce, parsley, purslain, cabbages, reddishes, potatoes, &c. &c. There are some salt works in this island.

The imports are wines, spirits, beer, light silken stuffs, linens, hats, stockings, shoes, salted provisions from Ireland, flour, spices, &c. &c. The exports are sugar, tobacco, cotton, ginger, and rum.

Nevis. This island, both as to soil and produce, much resembles St. Kitt's; the culture of sugar is much attended to. It is flourishing, considering the losses which it has sustained by plague, war, earthquakes, and tornadoes. All that has been heretofore said respecting the commerce of Barbadoes, Antigua, &c. may apply to that of Nevis, with this sole difference, that in the last-mentioned island sugar holds the place of money in every instance.

Montserrat produces the same articles of commerce as the other Antilles, such as sugar, rum, indigo, ginger, and cotton. Indigo forms a very considerable branch of its export trade. The island is extremely well cultivated, and many ships annually resort hither, although there is neither haven nor road in which they can ride with safety; however, when a storm is dreaded, the vessels betake themselves, without delay, to the ports of the islands of St. Kitt's and Antigua.

Anguilla. This island is fertile in wood, grain, and tobacco, the latter of a very excellent quality. The inhabitants are extremely indolent, and its commerce very inconsiderable.

Virgin Isles. The number of these islands is 60: the soil, for the most part, is, barren and dry. Some English families are established here, who cultivate the land to as great an extent as it will admit of, and feed cattle, which they send to Porto Rico and the neighbouring Carribbee islands.

Saint Vincent. Cotton, cocoa, coffee, and the sugar-cane thrive in this island. Great Britain has not, however, reaped any considerable advantages by its commerce with it. It is inhabited by nearly 600 whites, and from 7 to 8,000 blacks. Rum forms one of its export articles.

Dominica. The soil of this island is very good; the chief exports are sugar, coffee, cotton, rum, cocoa, and syrup.

Tobago produces cocoa, sugar, indigo, ginger, cotton, &c. Great quantities of excellent fish, and turtles, are likewise to be found here. The most considerable export article is sugar.

Grenada. Sugar, cotton, coffee, rum,

cocoa, and all sorts of fruit, are the produce of this island, and constitute its exports. The imports are the same as those of Barbadoes, Antigua, &c.

Guadaloupe. Its productions are chiefly cotton, sugar, coffee and cocoa, and although the trade is nominally carried on in toto with France, great quantities of these articles are exported to St. Martin and to America.

Martinique. The productions are similar to those of the two foregoing islands; tobacco, in large quantities, is grown here.

Mariegalante. What has been said of Martinique will also apply to this island.

Saint Bartholomew. The middle of this island is mountainous, consequently the soil is but indifferent. Some lignum vitæ and iron wood is, however, found here.

Saint Lucia. The soil is not bad, and in many parts of the island the sugar-cane is cultivated with no inconsiderable success. There are about fifty-five sugar-plantations in the island. The commerce is rather languid, and is almost entirely carried on with England.

Trinidad, formerly belonging to Spain, but now a British possession, lies between Tobago and the Spanish Main. It is about 90 miles long, and 60 broad: is a very fruitful country. It grows sugar, fine tobacco, indigo, ginger, all the fruits of the West Indies in great perfection, Indian corn or maize, and cotton. It was principally supported by smuggling in the hands of the Spaniards, but is rising much in value and produce since it was surrendered to Great Britain,

Saint Eustatia. Sugar, coffee, and tobacco are the chief productions and exports of this island. Its cotton is tolerably good.

Saba may be properly called the garden of St. Eustatia, to which it is adjacent. The frequent rains which fall upon its soil cause it to produce vegetables and fruits of an exquisite flavour, and cabbages of a singular size. They raise cotton and flax, from which they make stockings, and sell them to the other colonies.

Saint Martin. Beasts, birds, cotton, tobacco, and some coffee, constitute the riches and productions of this island, in return for which it receives the commodities of Holland and France. There are some salt-works in part of the island.

Saint Thomas, Saint Croix, and Saint John, produce sugar, cotton, coffee, rum, and cocoa, which they export to Denmark, Norway, and Holstein, and in return for which they receive various merchandises from the aforesaid countries.

Bahama Island. The soil of these islands is very thin and poor, but the climate favours every sort of territorial production; nevertheless, there is no settlement of the English less valuable than this. Formerly,

the island called Bahama furnished guiacum, sassafras, sarsaparilla, red-wood, and drugs of various kinds; at present it only produces maize and game, and that called Providence, only Brazil-wood and salt. It is at Acana that the last-named article is manufactured, whence it is sent to the Antilles, and to the American continent. Many other productions of the West Indies have been tried, but the land is soon worn out, and they have failed after one or two crops. The produce does not pay the expense of the possession; but, in time of war, these islands are useful in annoying the Spanish trade.

The Bermuda Islands. There are four of these islands which are habitable, besides several uninhabited ones; viz. St. George's, St. David, Long-bird islands, &c.

Maize thrives very well; there are two harvests of this grain annually, the one sown in March and reaped in July, and the other sown in August and reaped in December. The oranges and lemons have a delicious flavour, and are of a surprising size. The beasts of these islands thrive well, and their flesh is excellent. There is a vast quantity of land and water fowl likewise. The cedar-tree grows here to the height of 25 feet; it yields a kind of sweet-scented rosin: great quantities of this wood are brought to England, where it is well known and much esteemed. Fish, in abundance, is caught upon the coasts; amongst the rest turtle of a most delicious flavour. The whale fishery is carried on at the north-eastern extremity of Bermuda, from March till May, with very great success. Ambergris is thrown upon the coasts by the sea, and many pearls are found in the oysters attached to the rocks.

The merchandises of Europe which are brought hither are wines, brandy, corn, Irish provisions, stuffs, linens, iron-ware, and light mercery. These islands are very convenient for the American ships which trade to the Antilles, and which make it a practice to put into their ports, in order to take in fresh provisions. This is the principal advantage which accrues to England from the possession of the Bermudas; for the amount of their productions makes but a scanty appearance in the balance sheet of English traffic; nevertheless, if the inhabitants would but attend to the gathering of silk and cochineal, they might soon render the Bermudas of very high commercial importance.

Azores. The productions of the Azores are grain, wine, flax, various kinds of fruit, as oranges, lemons, &c. potatoes, beasts, game, and fish.

The commerce is carried on with Portugal, whither are sent large quantities of white and muscovado sugars, wood of different kinds, corn, rye, &c. &c.

AMETHYST, (GER. *Amethyst*. DU. *Amethysten*. DA. *Ametist*. SW. *Ametist*.

FR. *Amethyste*. IT. *Amatista*. SP. *Ametisto*. PORT. *Ametista*, *Ametisto*. LAT. *Amethystus*.) a gem of a purple colour, which seems composed of a strong blue and a deep red, and according as either of these prevails, affording different tinges of purple, sometimes approaching to violet, and sometimes even fading to a pale rose colour. Although amethysts are generally of a purple colour, yet they are found materially colourless, and may at any time be easily made so, by putting them into the fire, in which pellucid or colourless state they only want the hardness not to be distinguished from diamonds. The amethyst is scarcely inferior to any of the gems in the beauty of its colour; and in its purest state is of the same hardness and at least of equal value with the ruby or sapphire. It is found of various sizes, from the bigness of a small vetch to an inch and an half in diameter, and often much more than that in length.

This precious stone is found in the East and West Indies, and in several parts of Europe; some of the first specimens of the oriental ones being so hard and bright as to equal any of the coloured gems in value. However, by far the greater number of amethysts fall infinitely short of these, as all the European ones, and not a few of those brought from the East and West Indies, are very little harder than common crystal.

AMEAS SEED, (GER. *Ammysamen*. DU. *Amyzaad*. DA. *Ammyfo*. SW. *Ameos*, *Ammi*. FR. *Semence d'ammi*. IT. *Ameos*, *Ammi*. SP. *Ameos*, *Ammi*. PORT. *Ameos* *Amnio*. LAT. *Anomum verum*.) true *anomum*. This seed comes from a round fruit, the size of a grape, of a pungent taste, approaching to Camphor; it is an elegant aromatic. — *Kauffman*.

AMIANTHUS, or EARTH-FLAX; a fibrous flexible, elastic mineral substance; consisting of short, abrupt, and interwoven filaments. It is found in Germany in the strata of iron ore, sometimes forming veins of an inch diameter; also in Crete and Cyprus, in Tartary, Namur in the Low Countries, in Old Noricum, in Egypt, in the mountains of Arcadia, at Puteoli, in Corsica, Anglesea in Wales, Aberdeenshire in Scotland, at Montauban in France, and in Siberia. The amianthus may be split into threads and filaments, from one to ten inches in length, very fine, brittle, yet somewhat tractable, silky, and of a greyish colour.

The industry of mankind has found the method of employing this untoward mineral for the manufacture of a kind of cloth called *asbestos*: it has the wonderful quality of being incombustible in fire, which only serves to whiten it. The shorter filaments of the amianthus that separate in the washing of the stone, are used for making paper. The method of making *asbestos* is now lost: but

Bapt. Porta assures us, that in his time the spinning of the asbestos was a thing known to every one at Venice. This kind of cloth was chiefly esteemed among the ancients, being held equally precious with the richest pearls. — *Kauffman*.

AMMONIA. This alkaline substance, when in a state of purity, is in form of a gas, of a very pungent smell, extremely volatile; lighter than atmospheric air in the proportion of 6 to 10. It readily combines with water; forming a highly pungent, volatile liquor, of an acid taste, usually termed *liquid ammonia*. With carbonic acid it forms a concrete salt, possessing the volatile and pungent qualities of the fluid. Ammonia may be obtained in abundance from all animal bodies in a state of putrefaction: it is generally procured in England by a dry distillation of bones, horns, and other animal substances. It is found native, in combination with muriatic acid, in crystallized masses, called *sal ammoniac*, in the neighbourhood of volcanoes, in some of the mountains of Tartary and Thibet, and in the waters of some of the lakes in Tuscany. Formerly *sal ammoniac* was brought from Egypt in large quantities; it is said to have been made near the temple of Jupiter Ammon (whence it obtained its name), where there were large inns, in which pilgrims lodged, who usually travelled on camels. The proprietors had some method of collecting the urine of these beasts, which contains it in considerable proportion; and it was thence obtained by distillation.

Sal ammonia is employed by dyers to give a brightness to certain colours; and in what they call composition, to prevent the tin from being precipitated. It is also used by braziers, tin-plate workers, &c. In tinning metals, it is of use to cleanse the surfaces, and prevent them from oxidizing by the heat which is given them in the operation.

AMMONIACUM, (GER. Du. Da. Sw. *Ammoniak*. FR. *Gomme ammoniacue*. IT. *Gomma armoniaca*. SP. *Goma armoniaca*. PORT. *Goma armoniaca*. RUB. *Ammoniak*. POL. *Amoniak*. LAT. *Ammoniacum gummi*.) See title GUM.

AMMUNITION, a general term for powder, ball, and other implements of war.

Ammunition, arms, utensils of war, or gunpowder, imported by way of merchandize, without licence from his majesty, are forfeited, and treble the value, 1 Jac. 2. c. 8. s. 3. Arms, gunpowder, or saltpetre, may be prohibited to be exported by his majesty, when he shall see cause, by proclamation or order in council. 12 Car. 2. c. 4. s. 15. If shipped (after such prohibition) on board any vessel in the United Kingdoms of Great Britain and Ireland, to be exported contrary to such proclamation or order, are forfeited, and may be seized by warrant from any magistrate, or any custom-house, impost, or excise officer; and

every owner forfeits 100*l*. for every hundred of saltpetre and gunpowder, and 100*l*. for every twenty-five arms, and 100*l*. for every two hundred weight of any species of armunition; and so in proportion for a greater or less quantity. And every person aiding or assisting in shipping them, forfeits 100*l*. and treble the value of the goods. Also any master of a ship who takes them, or suffers them to be taken on board, forfeits 100*l*. 29 Geo. 2. c. 16. This act, and every clause, matter, and thing therein contained, shall extend to empower his majesty in like manner to prohibit the shipping the same in order to be carried coastwise, and these several provisions, as well respecting the articles, as their destination, are further extended by 33 Geo. 3. c. 2. Certain exceptions respecting military clothing, are made by 54 Geo. 3. c. 107. See further GUNPOWDER.

AMNESTY, an act or edict, whereby a prince promises his subjects a general pardon for all that is past.

AMOMI SEED, (GER. *Amömlin*. DU. *Amomixaad*. DA. *Amomfrö*. SW. *Amomfrö*. FR. *Amomes*. IT. *Amomo*. SP. *Amomo*. PORT. *Amomo*. LAT. *Amomum vulgare*.) These are brown grains brought from the East Indies, of a hot aromatic smell and taste, somewhat resembling that of cinnamon, cloves, and pepper. They are of the size of a chick pea, and grow on a tree, which has a red odoriferous wood, and bears a kind of berries or pods in the shape of grapes. These berries contain the seeds; which ought to be light-coloured, heavy, and well filled. If the berries are light, with black seeds and shrivelled, they are of no value. These seeds are only used in medicine. — *Kauffman*.

AMORPHA, *bastard indigo*, the seed of which was sent to England from Carolina about the beginning of the last century; it is a flowering shrub, propagated in the gardens about London.

AMOUNT, a term in arithmetic and book-keeping. It is said of the total, which several sums added together produce.

AMPHORA, the largest measure used at Venice for liquids, and is equal to about four English gallons.

ANA, in physic, a Greek preposition much used in prescriptions, to signify equal parts of the ingredients preceding it. See it explained under the article A.

ANACOSTE, or **ANASCOTE**, a sort of woollen-diaper stuff, manufactured at Leyden in Holland, and in the Austrian Netherlands; it is like serge, but not so woolly, about a French ell broad and twenty ells long. It is sent into Spain, where it is in great demand.

ANAGROS, a measure for grain used in some cities of Spain, particularly at Seville: Forty-six anagros make about 10½ quarters of London.

ANALYSIS, in chemistry, the reduction of a mixed body into its principles. This is one of the chief objects of chemistry, and is effected by heat and mixture.

Analysis of powers, is the operation of resolving them into their roots, otherwise called evolution.

ANATA, or **ANNOTTO**, (GER. *Rus.* and *Pol.* *Orlean.* *Du. Orlean.* *Rokoe.* *Da. Orleans.* *Sw. Orleana.* *Fr. Roucou.* *It. Oriana.* *Sp. Achiot.* *Port. Urucu.* *Lat. Orellana, Orleana, Bixa*) a kind of buff-coloured dye, which has acquired with us the name of *Nankeen*, from *Nanking*, in China, whence the callico so coloured first came. It is procured from the pulp of the seed capsules of a tree called *Bixa*, in South America, being prepared by the Spaniards; the mode is as follows: the contents of the fruit or capsule are thrown into a wooden bowl, where as much hot water is poured on them as is necessary to suspend the pulp. The seeds are taken out, and the wash is left to settle. The water is then poured off, and the sediment dried in the shade, after which it is made into balls or cakes for exportation.

ANATOCISM, signifies the taking of interest upon interest for the loan of money.

ANCHOR, in maritime affairs, is a very large and heavy iron instrument, with a double hook at one end, and a ring at the other, by which it is fastened to a cable. It is cast into the bottom of the sea, or rivers, where taking its hold, it keeps ships from being drawn away by the wind, tide, or current.

There are several kinds of anchors: 1. The sheet anchor, which is the largest, and is never used but in violent storms, to hinder the ship from being driven ashore. 2. The two bowers, which are used for ships to ride in a harbour. 3. The stream anchor. 4. The grapnel. The iron of which anchors are made, ought neither to be too soft nor too brittle. In order to give them a proper temper, it is the practice to join brittle with soft iron, and for this reason the Spanish and Swedish iron ought to be preferred.

The shank of an anchor is to be three times the length of one of its flukes, and a ship of 500 tons has her sheet anchor of 2000 weight; and so proportionably for others smaller or greater.

The anchor is said to be *a-peak*, when the cable is perpendicular between the hawse and the anchor. An anchor is said to *come home* when it cannot hold the ship. An anchor is *foul*, when by the turning of the ship, the cable is hitched about the fluke. To shoe an anchor, is to fit boards upon the flukes, that it may hold the better in soft ground. When the anchor hangs right up and down by the ship's side, it is said to be a *cock bell*, upon the ship's coming to an anchor.

By 53 Geo. 3. c. 87. pilots and others taking possession of anchors and other ship materials (belonging to wrecks,) shall give notice of the same to a deputy vice-admiral, or his agent, within 48 hours, on pain of being considered as a receiver of stolen goods. And if any person shall purchase any such anchor, &c. that shall have been so obtained, he shall be guilty of felony, and be transported for seven years. And any master of a vessel outward bound, finding, or taking on board, any anchor, &c. shall report the same to the Trinity House, and on his return shall deliver the same to a deputy vice-admiral, or his agent, nearest to the port where he shall arrive, under a penalty of not more than 200*l.* nor less than 50*l.*, on conviction before a magistrate on the oath of one witness; one half to go to the informer, the other half to the Merchant Seamen's Society, established by 20 Geo. 3. c. 38., and shall also forfeit double the value of the article to the owner. And every master of a vessel, pilot, &c. who shall convey any anchor, &c. to any foreign harbour, port, creek, or bay, and sell and dispose of the same, shall be guilty of felony, and be transported for 7 years.

Riding at anchor, is the state of a vessel moored and fixed by her anchors. *Dropping an anchor*, imports the letting it down into the sea. In some cases it is necessary to drop two anchors opposite to each other; one to keep the ship firm against the tide or flow, the other against the ebb. *Weighing anchor*, is the recovering it into the vessel in order for sailing. The anchor is ordinarily weighed by means of a windlass.

An Anchor is also a measure of brandy, &c. containing ten gallons, more commonly written *Anker*.

ANCHORAGE, or anchoring-ground, a place where a ship may cast anchor. The best anchoring-ground is stiff clay or hard sand; and the best place for riding at anchor, is where a ship is land-locked, and out of the tide.

The anchorage for ships, especially ships of war, being a subject of great importance to the naval and commercial interests of the kingdom, several statutes have been enacted for the protection of harbours. The first which it is necessary to notice here is 19 Geo. 2. c. 22. It prohibits masters of ships from casting out ballast, or rubbish of any kind, into any harbour or channel, except on the land where the tide never comes, on pain of forfeiting not more than 5*l.* nor less than 50*s.*, on conviction before a justice on view, or on the oath of one witness, or of being committed to prison for two months, which penalty is increased to 10*l.* over and above the expence of removing the same, by 54 Geo. 3. c. 159. In pursuance of the same object, 54 Geo. 3. c. 159. enables the lords of the admiralty to establish regula-

tions for the preservation of the king's moorings or anchorage, as well as for those of merchant ships, in all the ports, harbours, channels, &c. &c. of the United Kingdom, as far as the tide flows, where, or near to which, his majesty has, or may hereafter have, any docks, dock-yards, arsenals, wharfs, or moorings. It prohibits all descriptions of private ships from being moored or anchored, or placed in any of his majesty's moorings, &c. without special licence obtained from the admiralty, or other persons appointed to grant such licences, on pain of forfeiting not exceeding 10*l.*, one moiety to his majesty, the other to the informer, on conviction before any justice of the peace or commissioner of the navy.

It further prohibits the beaming of private vessels in such places, otherwise than appointed by the said authority of the admiralty; and the receiving or having gunpowder beyond a certain limited quantity, under a penalty of 5*l.* for every five pounds weight of such powder beyond the quantity allowed. It prohibits, likewise, all such private vessels, in any such places, having any guns on board shotted or loaded with ball, as well as firing and discharging any such before sun-rising and after sun-setting, under a penalty of 5*l.* for every gun so shotted, and 10*l.* for every gun so fired. It further gives to every officer of vessels of war, to harbour-masters, and others in their aid, a right of search in all private vessels so moored in such places, and inflicts a penalty of 10*l.* on resistance.

Anchorage also means a duty taken of ships for the use of the port or harbour.

ANCHOVIES, (GER. *Anschovis*. DU. and SW. *Ansjovis*. DA. *Ansjos*. FR. *Anchois*. IT. *Acciughe*. SP. and PORT. *Anchovas*. RUS. *Antshofischi*. LAT. *Encrasicoli*.) the name of a small sea-fish common in the Mediterranean. The fishing for anchovies is carried on chiefly in the night-time; when a light being put on the stern of the vessels, the fish flock round, and are caught in the nets. The anchovy is much used in sauces from the excellency of its taste. The importation of anchovies is especially provided for by sect. 14. of 10 & 11 W. 3. c. 24., by an exception to the prohibitions contained in the navigation act of Car. 2.

ANCIENTS, flags set in the stern of a ship.

ANKER, a liquid measure used for wine and brandy in France and Holland, containing about sixteen gallons wine measure.

ANCONY, in iron works, signifies a bloom, wrought into the figure of a flat iron bar of about three feet long, with two square rough knobs, one at each end, which are afterwards to be wrought at the chafery.

ANEE, a measure for grain used in some provinces in France. At *Lyons* it signifies a certain quantity of wine, which is the load

an ass can carry at once. That load is fixed at 80 English quarts wine measure.

ANEGRAS, a measure for corn used at Seville and Cadiz in Spain: four *anegras* make a *cahis*; four *cahis* make a *fanega*; and fifty *fanegas* the *last* of Amsterdam. — See WEIGHTS AND MEASURES.

ANEMOSCOPE, according to Vitruvius's description, a machine shewing from what point of the compass the wind blows. This is done by means of an index moving about an upright circular plate, the index being turned by an horizontal axis, and the axis by an upright staff, at the top of which is the vane moved about by the wind. It is, according to modern acceptance, an instrument to foretel the changes of the wind. See *Philos. Transact.* v. 43. part 2. page 9.

ANGEL, the name of an ancient gold coin in England. It takes its name from the figure of an angel represented on it. It was 25 $\frac{3}{4}$ carats fine, and weighed four pennyweights. Its value differed in different reigns. In the reign of Henry VI. it was 6*s.* 8*d.*; in the 1st Henry VIII. 8*s.*; in the 6th Edward VI., and in the succeeding reigns of Mary and Elizabeth, it was 10*s.*

ANGELICA, (GER. *Angelika*. DU. *Engschwortel*. DA. *Angelik*. SW. *Angelika*. FR. *Angelique*. IT. and PORT. *Angelica*. SP. *Angelika*. RUS. *Djugil*. POL. *Dziegiel*. LAT. *Angelica radix*.) is a plant of some virtues, being stomachic, cordial, and alexipharmic; it causes perspiration, and is said to drive out humours through the pores of the skin. The root, stalk, leaves, and seed, are used. — *Miller*.

ANIL, so called by the inhabitants of all the different countries where it grows, is the plant from which indigo is made. See INDIGO.

ANIME, or GUM ANIMÆ. See title GUM.

ANINGA, a root which grows in the Antilles islands, and is pretty much like the China plant. It is used by sugar-bakers for refining the sugar, and is more effectual and less dangerous than the sublimate of mercury and arsenic.

ANISE, or ANISUM, (GER. DU. SW. FR. SP. PORT. and RUS. *Anis*. DA. *Anys*. IT. *Anice*. POL. *Anyz*. LAT. *Anisum*.) a small seed of an oblong shape. It is cultivated in Germany, but the best comes from Spain. It should be chosen fresh, large, plump, newly dried, of a good smell, and a biting aromatic taste, without any bitterness. There is extracted from anise-seed a kind of white oil, called essence of anise. *Anise-seed* is noted among the drugs and spices to be garbled, in *stat.* 1 Jac. 1. c. 19.

ANKER, a liquid measure at Amsterdam. It contains about thirty-two gallons English measure.

ANNABASSES, a coarse blanketing, made in France for their Guinea trade, and in particular for that on the coast of *Angola*.

ANNEALING, or NEALING, as it is called by the workmen, is a process particularly employed in the glass-houses, and consists in putting the glass vessels, as soon as they are formed, and while they are yet hot, into a furnace or oven, not so hot as to remelt them, and in which they are suffered to cool gradually. This is found to prevent their breaking easily, particularly on exposure to heat. There can be little doubt but it is to this process of perfecting glass, that Shakspeare alludes in the celebrated passage "unanoined, unannealed," with their unnatural explanations of which, commentators have puzzled both themselves and their readers.

A similar process is used for rendering cast-iron vessels less brittle, and the effect depends on the same principles.

A. D. or ANNO DOMINI, the computation of time from the incarnation of Jesus Christ, which is generally inserted in the dates of all public instruments. The year of the reign of the existing sovereign is frequently added, especially in criminal proceedings, as all such are generally issued or promulgated in the name of the king for the time being. The mode of computing has been in all countries from some remarkable event. The Romans reckoned from the building of Rome. The Jews (according to the Mosaic accounts) from the creation of the world. The Greeks from the commencement of their Olympiads. The Mahometans reckon from the Hegira, or flight of their prophet from Mecca. The Christian world, from the event which occasions the introduction of this article.

ANNOTTO. See ANATA.

ANNUITANT, a person who has an annuity.

ANNUITIES, from the Latin word *annus*, a year; periodical payments of money, amounting to a fixed sum in each year, and continuing for a certain period, as for 10, 50, or 100 years, or for a certain period, to be determined by a particular event, as on the failure of a life, or for an indefinite term; which latter are called perpetual annuities. The times of payment are either yearly, half-yearly, quarterly, weekly, or at any other intervals that may be determined on previously to the commencement of the annuity, or regulated during its continuance.

The definition of the term has been already given, but it is necessary to guard against a misconception not uncommon respecting the application of that definition. An annuity is correctly an annual payment, *chargeable only upon the person* of the grantor; but it is frequently confounded in common parlance with a *rent charge*, which is a burthen imposed upon, and issuing out of, *lands*.

All calculations relating to annuitants are made on the principle of improving money at compound interest, and are generally for

an annuity of *1l.* from which the value of any other annuity is easily derived.

Let *r* represent the amount of *1l.* in one year; that is, one pound increased by a year's interest, then *rⁿ*, or *r*, raised to the power whose exponent is any given number of years, will be the amount of *1l.* in three years; its increase in the same time is *rⁿ-1*; now the interest for a single year, or the annuity answering to the increase, is *r-1*; therefore, as *r-1* is to *rⁿ-1*, so is *u* (any given annuity) to *a* its amount. Hence we have

$$\frac{u \times r^n - 1}{r - 1} = a$$

by which the amount of an annuity for any number of years, at any given rate of interest, is found. In the same manner the present value of annuities is obtained; for as *1l.* is the present value of *rⁿ*, its amount in *n* years, and as the present value of any other amount, and consequently of

$$\frac{u \times r^n - 1}{r - 1}$$

must bear the same proportion

to that amount, we have

$$\frac{u \times 1 - \frac{1}{r^n}}{r - 1}, \text{ or } \frac{u}{r - 1} = p.$$

From these theorems, the other cases relating to annuities may be easily deduced; but as the involution of high powers is a tedious operation by common arithmetic, most questions relative to annuities may be more conveniently answered by the help of logarithms. It is, however, seldom necessary to have recourse to either of these methods, as tables of the amount and present worth of annuities are inserted in most books that treat of compound interest or annuities.

TABLE I.

Shewing the Amount of an Annuity of *1l.* in any Number of Years, not exceeding 100l. when improved at 5 per Cent. per Ann. Compound Interest.

EXAMPLE.

What is the present worth of an annuity of 30*l.* to continue for 16 years, at 5 per cent. compound interest? The value in the Table against 16 years is 10,837770, which multiplied by 30, gives the answer 325*l.* 2*s.* 7*d.*

Reversionary Annuities are those which do not commence till after a certain number of years, or till the decease of a person, or some other future event has happened.

The present value of an annuity which is not to commence till the expiration of a certain period, may be found by Table II. by deducting from the value of an annuity, for the whole period, the value of an annuity to the time at which the reversionary annuity is to commence.

Example. — What is the present value, at 5 per cent. compound interest, of 50*l.* per annum for 20 years, commencing at the end of seven years from the present time? The value of an annuity for 27 years is 14,643034, and the value of an annuity for seven years is 5,786373; the latter, deducted from the former, leaves 8,856661, which, multiplied by 50, gives 442*l.* 16*s.* 7*d.* the value of the reversionary annuity.

ANNUITIES, Life, annual payments to continue during any given life or lives. The present value of a life annuity is the sum which would be sufficient (allowing for the chance of the life failing) to pay the annuity without loss; and supposing money to pay no interest, the value of an annuity of 1*l.* is equal to the expectation of the life. Thus the expectation of a life aged 40 is 23 years; or in other words, that a set of lives of this age will, one with another, enjoy 23 years each of existence; some of them enjoying a duration as much longer as others fall short of it. Therefore, supposing money to bear no interest, 23*l.* in hand for each life would be sufficient to pay to every number of such lives 1*l.* per annum for their whole duration, or in other words, 23*l.* is on this supposition the value of a life aged 40. But if any improvement is made of money by putting it out to interest, the sum just mentioned will be more than the value, because it will be more than sufficient to pay the annuity, by as much as the improvement or interest is greater. Thus, if money may be so improved by being put out to interest at 5 per cent. as to double itself in 14 years, the seller of such an annuity on putting out half the purchase money to interest, will at the end of 14 years find himself in possession of 20*l.* 10*s.* being 11*l.* 10*s.* more than is sufficient to pay the remainder of the annuities, though he should make no further improvement of the purchase money. At whatever rate of interest the money is improved, there must be a surplus; and if it is *fully* improved at 5 per cent., it will be found that 11*l.* 16*s.* 8*d.* for each annuity will be sufficient (instead of 23*l.*) to make all the annual payments; or if money can be improved at 6*l.* per cent., 10*l.* 14*s.* 1*d.* will be sufficient. Many persons have fallen into an error respecting the value of life annuities, by considering it the same as the value of an annuity certain for a term of years equal to the expectation of the life. The inaccuracy of this mode of computation arises from the difference between the value of a certain number of payments to be made every year regularly till the term is completed, and the value of the same number of payments to be made at greater distances of time from one another, and not to be all made till many years after the expiration of the term equal to the expectation.

The true method of computing the values of life annuities cannot be more clearly ex-

pressed than as it is given in "The Doctrine of Annuities and Assurances on Lives and Survivorships," by William Morgan. "Was it *certain* that a person of a given age would live to the end of a year, the value of an annuity of 1*l.* on such a life would be the present sum that would increase in a year to the value of a life one year older, together with the value of the single payment of 1*l.* to be made at the end of a year; that is, it would be 1*l.* together with the value of a life aged one year older than the given life, multiplied by the value of 1*l.* payable at the end of a year. Call the value of a life one year older than the given life *N*, and the

value of 1*l.* payable at the end of a year $\frac{1}{r}$;

then will the value of an annuity on the given life, on the supposition of a *certainty*,

be $\frac{1}{r} + \frac{1}{r} \times N = \frac{1}{r} \times \overline{1 + N}$. But the

fact is, that it is *uncertain* whether the given life will exist to the end of the year or not. This last value, therefore, must be diminished in the proportion of this uncertainty; that is, it must be multiplied by the probability that the given life will sur-

vive one year, or supposing $\frac{b}{a}$ to express

this probability, it will be $\frac{b}{ar} \times \overline{1 + N}$. In

the same manner the values of annuities on the *joint continuance* of lives may be found:

Call the value of any two joint lives *M*, the probability that two lives one year younger

will exist a year $\frac{bd}{ac}$, and $\frac{1}{r}$ as above, the

value of 1*l.* payable at the end of the year.

Then, by reasoning as before, the value of the joint continuance of two lives one year

younger will be expressed by $\frac{bd}{acr} \times \overline{1 + M}$."

By these theorems tables may be calculated of the values of single or joint lives, according to any table of the probabilities of life, and by the use of logarithms, and computing upwards from the oldest to the youngest life, the labour of forming such tables is not very great; few persons, however, have occasion to undertake it, as the tables published by Dr. Price, Mr. Morgan, and Mr. Maseres, shew the values of life annuities as accurately as the present knowledge of the decrements and duration of human life will admit, and are sufficient for almost every useful purpose.

TABLE I.

Shewing the Value of an Annuity of 1*l*. on a Single Life, at every Age, according to the Probabilities of the Duration of Human Life at Northampton, reckoning Interest at 5 per Cent.

37	12.249	86	2.328
38	12.116	87	2.193
39	11.979	88	2.080
40	11.837	89	1.924
41	11.695	90	1.723
42	11.551	91	1.447
43	11.407	92	1.153
44	11.258	93	0.816
45	11.105	94	0.524
46	10.947	95	0.238
47	10.784	96	0.000
48	10.616		

These values suppose the payments to be made *yearly*, and to begin at the end of the first year; if the payments are to be made *half-yearly*, the value in the table will be increased about one-fifth of a year's purchase.

In order to find the present value of an

annuity during any given life, it is only necessary to multiply the value in the table corresponding with the age, by the given annuity.

Example. What should a person aged 45 give, to purchase an annuity of 50*l*. during his life?

The value in the table against 45 years is 11.105, which multiplied by 50, gives the answer 555*l*. 5*s*.

TABLE II.

Shewing the value of an Annuity during the joint continuance of Two Lives, according to the probabilities of life at Northampton, reckoning interest at 5 per cent.

Ages.	Value.	Ages.	Value.

50—80	3.140	90—90	0.909

It is unnecessary to insert a Table of the values of the longest of two lives, as it may be easily found in the values given in the above tables by the following general rules:

“From the sum of the values of the single lives subtract the value of an annuity on the joint lives, and the remainder will give the value of an annuity on the continuance of the longest of two such lives.”

Example. What is the value of an annuity on the longest of two lives whose ages are 30 and 40?

By table I. the value of a single life of 30 is 13.072, and by the same Table the value of a single life of 40 is 11.837. Their sum therefore is 24.909, from which 9.576 (the value of the joint lives of 30 and 40 by Table II.) being subtracted gives 15.333 for the number of years' purchase required.

The value of an annuity on three joint lives, may be found from the preceding tables, by the following rule:

“Let A be the youngest, and C the oldest of the three proposed lives. Take the value of the two joint lives B and C, and find the age of a single life D of the same value. Then find the value of the joint lives A and D, which will be the answer.”

Example. Let the three given lives be 20, 30, and 40. The value of the two oldest joint lives B and C will (by Table II.) be 9.576, answering in Table I. to a single life D of 54 years; and the value of the joint lives A and D, or the ages in the Table which come nearest to them, gives 8.216 for the value sought.

The value of three joint lives being known, the value of the longest of any three lives may be computed by the following rule:

“From the sum of the values of all the single lives, subtract the sum of the values of all the joint lives combined two and two. Then to the remainder add the value of the three joint lives; and this last sum will be the value of the longest of the three lives.”

Example. The sum of the values of three single lives, whose ages are 20, 30, and 40, is (by Table I.) 38.916. The value of two joint lives whose ages are 20 and 30, is (by Table II.) 10.707; of two joint lives whose ages are 20 and 40, is 9.937, and two joint lives, whose ages are 30 and 40, is 9.576; the sum of these three values is 30.220. This sum subtracted from 38.916, leaves 8.696, which remainder added to 8.216 (the value of the three joint lives in the last example), gives 16.912, the value of the longest of the three lives. The answers in this and the preceding example are not quite exact, in consequence of the table of joint lives being confined to the combinations of every fifth year of age; those who have occasion to make such computations, will find more extensive tables of the values of joint lives in Dr. Price's excellent Treatise on Reversionary Payments; but a general table of the values of two joint lives for every possible difference of age, at different rates of interest, has long been very desirable.

The solutions of the following Problems, in addition to the rules already given, will comprehend all the cases which most commonly occur, relating to the values of annuities on lives or survivorship.

PROB. I. To determine the value of an annuity on a given life for any number of years.

Solution. Find the value of a life as many years older than the given life as are equal to the term for which the annuity is proposed. Multiply this value by 1*l.* payable at the end of this term, and also by the probability that the life will continue so long. Subtract the product from the present value of the given life, and the remainder multiplied by the annuity will be the answer.

Example. Let the annuity be 20*l.* the age of the given life 35 years, and the term proposed 14 years. The value of a life aged 49 years (or 14 years older than the given life), appears by Table I, to be 10.443. The value of 1*l.* payable at the end of 14 years is .505068, and the probability that the life will exist so long, is $\frac{307}{1000}$. These three values multiplied into each other are equal to 3.861, which being subtracted from 12.502 (the present value of the given life by Table I.) we have 8.641, and this remainder multiplied by 20, gives 162*l.* 16*s.* 4*d.* for the value required.

In a similar manner the value of an annuity for any given term, upon two joint lives may be determined.

PROB. II. To find the value of an annuity certain for a given term after the extinction of any given life or lives.

Solution. Subtract the value of the life or lives from the perpetuity, and reserve the remainder. Then say, as the perpetuity is to the present value of the annuity certain, so is the said reserved remainder, to a fourth proportional, which will be the number of years' purchase required.

Example. A and his heirs are entitled to an annuity certain for 14 years, to commence at the death of B, aged 35. What is the present value of A's interest in this annuity?

By Table I. the value of the life of B is 12.502, which subtracted from 20, the perpetuity, leaves 7.498 for the remainder to be reserved. Then, as 20 is to 9.898 (the value of an annuity certain for 14 years), so is 7.498 (the reserved remainder), to 3.7107, the number of years' purchase required.

PROB. III. To find the value of an annuity for a term certain, and also for what may happen to remain of a given life or lives after the expiration of this term.

Solution. Find the value of a life or lives as many years older than the given life or lives as are equal to the term for which the annuity certain is proposed. Multiply this value by 1 $\frac{1}{2}$ payable at the end of the given term, and also by the probability that the given life or lives will continue so long. Add the product to the value of the annuity certain for the given term, and the sum will be the answer.

Example. Let the value be required of an annuity certain for 14 years, and also for the remainder of a life now aged 35 after the expiration of this term. By Table I. the value of a life aged 49 (or 14 years older than the given life) is 10.443. The value of 1 $\frac{1}{2}$ payable at the end of 14 years, is .505068, and the probability that the life will exist so long is $\frac{29.6}{43.6}$. These three numbers multiplied into each other, produce 3.861, which being added to 9.898, the value of an annuity certain for 14 years, becomes equal to 13.759, the number of years' purchase required.

PROB. IV. To determine what annuity any given sum will purchase during the joint lives of two persons of given ages, and also during the life of the survivor, on condition that the annuity shall be reduced one-half at the extinction of the joint lives.

Solution. Let twice the given sum be divided by the sum of the two single lives, and the quotient will give the annuity to be paid during the joint lives; one half of which is therefore the annuity to be paid during the remainder of the surviving life.

Example. A aged 27, and B aged 35, are desirous of sinking 1000 $\frac{1}{2}$ in order to receive an annuity during their joint lives, and also another annuity of half the value during the remainder of the surviving life. It is required to determine what annuities should be granted them under those circumstances. By Table I. the value of a life of 27 is 13.377, and the value of a life of 35 is

12.502. 2000 $\frac{1}{2}$ (or twice the given sum) being divided by 25.879 (the sum of the values of the two lives), gives 77.282 $\frac{1}{2}$ for the annuity to be granted during the joint continuance of the lives; and its half, or 38.641 $\frac{1}{2}$ is the annuity to be paid during the life of the survivor.

PROB. V. B, who is of a given age, will, if he lives till the decease of A, whose age is also given, become possessed of a perpetual annuity, or of an estate of a given yearly value; to find the worth of his expectation in present money.

Solution. Find the value of an annuity on two equal joint lives, whose common age is equal to the age of the oldest of the two proposed lives, which value subtract from the perpetuity, and take half the remainder: then say, as the expectation of duration of the younger of the two lives, is to that of the older, so is the said half remainder, to a fourth proportional; which will be the number of years' purchase required when the life of B in expectation is the older of the two: but if B be the younger, then add the value so found to that of the joint lives A and B, and let the sum be subtracted from the perpetuity, and you will also have the answer in this case.

Example. Suppose the age of B to be 30, and that of A 20 years, and the value of the estate 50 $\frac{1}{2}$ per annum. Then the value of two equal joint lives, aged 30, is by Table II. 10.255, and the perpetuity being 20, the difference will be 9.745, the half of which is 4.872. Therefore as 33.43, the expectation of A, is to 28.27, the expectation of B, so is 4.872, to 4.119, which, being multiplied by 50, the given annuity, we have 205.95 $\frac{1}{2}$ for the required value of B's expectation.

If the age of B had been 20, and that of A 30 years, then to 4.119, the value just found, add the value of the joint lives, which, by Table II., is 10.707, and the sum is 14.826, which subtracted from 20, the perpetuity, and the remainder multiplied by 50, gives 258.7 $\frac{1}{2}$ for the required value in this case.

Having given this illustration of life annuities, it is necessary to show how far they are protected, or prohibited, by law.

The practice of purchasing annuities for lives at a certain price or premium, instead of advancing the money on an ordinary loan, generally arises from the inability of the borrower to give the lender a permanent security, for the return of the money borrowed at any one period of time: he therefore stipulates (in effect) to repay annually, during his life, some part of the money borrowed, together with legal interest, for so much of the principal as annually remains unpaid, and an additional compensation for the extraordinary hazard run, by the contingency of the borrower's death; all which considerations taken together constitute the

just proportions or quantum of annuity to be granted. 2 *Black*. 461.

The real value of the contingency, then, as has been explained, depending on the age, constitution, situation, and conduct of the borrower, the price of annuities (each case depending on its own particular circumstances,) cannot be reduced to any general rules. It is sufficient, therefore, with reference to this particular view of the subject, to observe, that if the lender's principal be really and *bonâ fide* put into jeopardy, no inequality of price alone will make the transaction usurious, although in cases of great enormity relief may sometimes be obtained in equity. *Carth. Rep.* 67.

The legislature has, by different statutes, endeavoured to throw some checks in the way of improvident transactions of this kind. The first of these was 17 Geo. 3. c. 17.; but this statute was so fraught with formalities to be observed, and *these* were expressed in such indistinct terms, that it not only became the fruitful source of endless litigation, but actually subjected the fairest transactions to insuperable difficulties, and the most unwarranted imputations. Wherefore it was repealed, as to all prospective operation, by 53 Geo. 3. c. 141. By the last-mentioned statute, it is enacted, that within 30 days after the execution of every deed or instrument, whereby *any annuity or rent charge* shall be granted for one or more lives, or for term of years determinable on a life or lives, a memorial of the date of every such deed or instrument, with the names of all the parties and all the witnesses, and of the persons for whose lives such annuity, &c. shall be granted, and of the person by whom the same is to be beneficially received, with the consideration and annual sum to be paid, shall be enrolled in the Court of Chancery, or be void to all intents and purposes.

By sect 8. all contracts for the purchase of annuities by persons under age are declared to be void, notwithstanding *any attempt to confirm the same after such person shall have attained the age of 21*. Moreover, every person who shall by *any means* solicit or ask any person under the age of 21 years *to grant, or attempt to grant, any such annuity or rent charge, or to execute any deed, &c. for such purpose,* shall be guilty of a misdemeanor, and on conviction before any court of assize, oyer and terminer, or general gaol delivery, shall be punished by fine, imprisonment, or other corporal punishment, at the discretion of the court.

By sect. 9. all attorneys, agents, and brokers, soliciting or procuring any loan, actually paid for any such annuity, over and above 10s. in the hundred, shall be in like manner guilty of a misdemeanor, and be punished on conviction as aforesaid, by fine and imprisonment, *or one of them*; and the parties paying the gratuity or reward shall be competent witnesses to convict.

Exceptions, as to Scotland and Ireland, and other parts beyond the seas; to annuities granted by will, marriage settlement, and bodies corporate, and to voluntary annuities, granted without regard to pecuniary consideration, are introduced in the last section of the statute.

ANNUL, in book-keeping, signifies to render an article null by making it of no import in the account. Instead of erasing a sum that has been carried by mistake to the credit side of an account, the account is debited for the same sum; and, on the contrary, if a sum has been placed to the debtor side of an account, the same sum is placed to the credit of the account, and it is customary to mark the article thus *annulled* with the same letters, as A A. or B B. after which the said sum is carried to account, as it ought to have been if no error had happened.

ANTEDATE, a spurious or false date, prior to the true date of a bond, bill, &c. Antedates are of a very dangerous consequence in matters of trade. See BILLS OF EXCHANGE, on this subject.

ANTI-ATTRITION, a word of modern introduction, as a denomination for an unctuous mixture; for the preparation of which a patent was obtained in 1813. According to the specification, the mixture consists of one hundred weight of plumbago, to four hundreds of hogs-lard, or other grease, the two to be well incorporated. The application is to prevent the effects of friction in all descriptions of engines or machines; and a sufficient quantity must be rubbed over the surface of the axle, spindle, or other part where the bearing is.

ANTIMONY, (GER. & DU. *Spiesglas*. DA. *Spidsseglas*. SW. *Spitsglas*. FR. *Antimoine*. IT. SP. & PORT. *Antimonio*. RUS. *Antimonia*. POL. *Spisglas*. LAT. *Antimonium*.) one of the semi-metals, separated by fusion from a very hard and heavy lead-coloured substance, called ore of antimony: this ore is composed of a number of extremely small sparkling granules, which give it the appearance of a lump of the purest steel, when fresh broken. Antimony is of a greyish white colour, and has a good deal of brilliancy. Its texture is laminated, and exhibits plates crossing each other in every direction, and sometimes assuming the appearance of imperfect crystals. When rubbed upon the fingers it communicates to them a peculiar taste and smell. The mines, whence antimony is taken, are situated in Hungary, Transylvania, Bohemia, Saxony, and many parts of France. Founders, pewterers, and clock-work makers, all make use of antimony. It is also much used in pharmacy.

ANVILS, (GER. *Ambosse*. DU. *Aanbeelden*. DA. *Ambolder*. SW. *Anbultar*. FR. *Enclumes*. IT. *Ancudini*. SP. *Yunque*. PORT. *Bigornias*. RUS. *Nakowalni*. POL.

Kowadla,) large masses of iron, used by several handicraftsmen, who work and forge, or hammer metals, particularly by silversmiths, blacksmiths, locksmiths, farriers, armourers, &c. There are two sorts of *Anvils*: some are forged, and others cast; the former are made by the blacksmiths, and the latter are cast in the founderies.

The best are those which are hammered, and the upper part of which is steel.

APOTHECARY, one who practises the art of pharmacy, which is that part of physic consisting in the choice, the due preparation, and mixture, of medicines. In London, the apothecaries are one of the City Companies, and by an act, which was made perpetual in the 9th year of Geo. 1. are exempted from serving upon juries, or in ward, and parish, offices.

The faculty of Apothecaries was incorporated by a charter of King James I.; but the provisions therein made for the regulation of the fraternity having proved inadequate, they are further regulated by 55 Geo. 3. c. 194. This statute repeals such of the provisions of the charter of James, as refer to certain powers given to the masters and wardens of the company to enter shops, examine medicines, and impose penalties. In lieu thereof, it gives authority to certain persons to be appointed, not being fewer in number than two, to enter the shops of all apothecaries, and examine the medicines and other things sold by them, and to burn and destroy all which they shall find to be false, unlawful, stale, corrupt, pernicious, or hurtful; as also to report the same to the master and society, who shall have power to levy a fine of 5*l.* for the first, 10*l.* for a second, and 20*l.* for every subsequent offence. It further imposes a penalty on all apothecaries who shall refuse to compound or sell, as well as who shall negligently or unfaithfully compound or sell, any medicine directed by any prescription of any physician *lawfully licensed* to practise physic, by complaint before a justice of the peace, within 21 days, by such physician. It prohibits any person from beginning to practise as an apothecary in England and Wales, after August 1. 1815, without having previously obtained a certificate, on pain of forfeiting 5*l.* and of being disabled from recovering any charges claimed by him in any court of law.

Penalties not exceeding 5*l.* to be recovered by information before justices of the peace; all above 5*l.* by action in the name of the master and wardens. Chymists and druggists are exempted from the operation of this statute, and all actions under it are limited to six months.

APPAREL. See WEARING APAREL.

APPEAL, in its general acceptance, signifies a reference of some question in dispute from the determination of an inferior, to that of a superior, authority. In this

sense it is used when the order or conviction of one or more individual magistrates is carried by *appeal* to the Court of Quarter Session. But it has also another *legal* interpretation; for in early times, when a pecuniary compensation to parties injured by the commission of any public offence, made part, at least, of the punishment of offenders, the civil suit which was allowed to be prosecuted by the person injured, or his relatives, for the recovery of this compensation, was denominated an Appeal. Of these there were several kinds formerly, but, except in the single case of murder, they have long become obsolete, and even in *that* the difficulties are such that it is seldom resorted to. 1 *Bac. Ab.* 190.

APPLES. See CYDER.

APPRAISEMENT, the valuing or setting a price on goods. If a sworn-appraiser value goods too high, he is obliged to take them at the price appraised. 13 Edw. 1. Persons appraising estates or effects, for hire or reward, not being licensed auctioneers, must take out a licence, under penalty of 50*l.* 46 Geo. 3. c. 43. Appraisers neglecting to set down appraisements on paper duly stamped, forfeit 50*l.*; and persons employing them, and receiving such appraisement without stamp, forfeit 20*l.* Id.

The stamp duties are as follow: —

	£.	s.	d.
Amount, not exceeding 50 <i>l.</i> duty	0	2	6
- " 100	0	5	0
- " 200	0	10	0
- " 500	0	15	0
Exceeding 500	1	0	0

Exemptions. — Appraisements in admiralty, and for ascertaining legacy duties. See further, title AUCTIONEER.

APPRENTICE, a youth of either sex, bound by indenture to some person, in order to be instructed in a certain science, mystery, or trade. The 5 Eliz. c. 4. is the statute on which the foundation of all apprenticeships rests. The different provisions of its various sections have been extended, restricted, modified, or repealed, respectively, as the successive alterations in the circumstances of the times suggested; but still it remains the corner-stone of the fabric. It directs the means, and the manner, of binding, the time for which apprentices shall be bound, and the consequences of disobedience to its injunctions. It is *general*, and applies to apprentices of all descriptions and denominations. The 43 Eliz. c. 2. regulates the binding of the poor by the instrumentality of the parochial officers, in *particular*.

The 2 & 3 Ann. c. 6. applies especially to the binding of the children of paupers and vagrants to the sea service.

The 20 Geo. 2. c. 19. (amended by 32 Geo. 3. c. 57. and 33 Geo. 3. c. 55.) provides for the settlement of disputes between masters and apprentices.

The 48 Geo. 3. c. 98. is the most recent, which imposes the duties to be paid on all indentures of apprenticeship (those of paupers excepted), according to a certain progressive augmentation, in proportion to the amount of the consideration inserted in the indenture.

On so comprehensive a subject, and on which such an unusual number of statutes have been enacted, any attempt to compress, within the necessary limit here, any thing like an epitome of the whole law, is impracticable. The best books to apply to for technical and particular information, are, *Chitty on Apprentices*, and *Dickinson's Practical Exposition*. Suffice it here, therefore, to submit only some such general information as may be subservient to daily use, with such of the most recent provisions of the legislature as are not yet, perhaps, universally known.

The deed by which an apprenticeship is created must be indented, for otherwise it does not satisfy the words of the 5 Eliz. which mentions an "*indenture*." And if a deed-poll were to be indented afterward, it would be a forgery.

The 5 Eliz. directs all indentures of apprenticeship to be for 7 years at least; but it has been repeatedly determined, that if the apprentice arrive at the age of 21 before the expiration of the term, he may elect to avoid them, and that, though he be himself a party to the instrument.

The 5 Eliz. also says, that all indentures for a term less than 7 years shall be void. But the interpretation put on the word *void*, by the courts of law, has also been "*voidable*" at the option of the parties.

A counterpart of an indenture is generally made; but it is not necessary, except in the case of an apprentice to the sea service, and in that it is specially made so by statute.

An apprentice cannot, however, avoid his indentures by the commission of an offence, as absconding; for though he might when of age declare his dissent legally, he cannot take advantage of a crime, committed for the purpose of dissolving them, inferentially.

Parish apprentices, by the 43 Eliz., must be bound by the major part of the churchwardens and overseers, with the consent of two justices. And by 56 Geo. 3. c. 139. it is directed that the indenture shall be allowed by two justices of the county *into* which the apprentice is to be bound, as well as by two of the county *from* which he is bound. By this statute also it is prohibited to bind poor children till they shall have respectively attained the age of nine years, nor to any person living at a greater distance than 40 miles from the place to which every such child shall belong (except in certain cases), under a penalty on the overseers binding, and also on the master receiving, of 10*l.* respectively. Nor shall any master be at liberty to discharge, or dismiss, or assign any such apprentice, without the consent in

like manner of two justices, under a similar penalty of 10*l.*

There was in the 5 Eliz. a restraining clause, prohibiting all persons from setting up and exercising any trade or mystery, except they had served an apprenticeship for seven years. This clause operated as an impolitic restraint upon genius, upon industry, and upon the use of capital. On the interpretation of the clause itself there were many conflicting determinations, and at last it was repealed by 54 Geo. 3. c. 96. (except so far as the bye laws of any city, corporation, &c. are concerned.) This last-mentioned statute further repeats the prohibitions contained in the 5 Eliz. against the taking apprentices in any other manner, and for any other periods, than those specified in that statute, as also the penalties imposed by it for such contravention of its provisions; and enacts that all indentures, deeds, and agreements in writing, relating to such apprenticeships, which would be otherwise valid and effectual, shall be valid and effectual.

The 56 Geo. 3. c. 67., in reference to the bye laws of many cities and corporations, which might prevent the advantage held out by the foregoing statute of 54 Geo. 3. from being communicated to many persons who had not served out the full time of their apprenticeships, but who meritoriously served in the late wars, enacts that *all such persons (notwithstanding any such bye law of any such city, corporation, &c.)* who shall have served in the king's service since June 22. 1802, and not have deserted, shall be enabled, as also their wives and children, without let, suit, or molestation, to set up and exercise any trade in any city, town, or other place within the kingdom, and shall not be liable to be removed from such city, town, &c. to their last legal place of settlement, unless actually chargeable; and further, if any such person, or his wife or child, shall be sued, indicted, or impleaded for setting up, &c. any such trade, and be found not guilty, in consequence of having proved that he had so served his majesty, he shall have double costs.

The consequences of serving an apprenticeship, so far as respects the settlement of the person who has served, belongs more properly to title *Settlement*.

Such is the general outline of the provisions respecting apprentices which come within the design of this work. Local regulations it is impracticable to notice, at least beyond a few prominent ones that affect the metropolis. The chamberlain of London has particular cognizance of every thing relating to apprenticeships within the jurisdiction of the city. Disorderly apprentices may be committed by him to Bridewell. If a master refuse to make the apprentice free after the expiration of his service, upon complaint to the chamberlain, he will summon the master; and if the judgment be in favour

of the apprentice, he shall have his freedom. If the master refuse to appear to the chamberlain's summons, the lord mayor or recorder may compel his appearance by warrant. If an apprentice wilfully omit to take up his freedom within a reasonable time, it is said the chamberlain may impose a fine upon him.

It is laid down by many authorities that apprentices cannot be the subjects of assignment; and in strictness they could not be assigned *generally*; but in case of the decease of the master, or his insolvency, and in some other events, modern statutes have obliquely, at least, permitted such transfers. However, by the custom of London, an apprentice might be assigned or turned over by his master *being a freeman* of the city, to any other master *being also a freeman*. It is said an apprentice may be discharged from his apprenticeship in the city of London for the following causes. 1. For unmerciful correction, or the withholding of necessaries in food, cloathing, &c. 2dly. For turning him away and refusing to receive him. 3dly. In case of his relinquishing his trade and refusing to provide his apprentice with some other master. 4thly. If the master remove out of the freedom. 5thly. If he neglect or refuse instruction to his apprentice. 6thly. If the apprentice be under the age of 14 when bound. 7thly. If the indenture be for less than seven years. 8thly. If the indenture be not enrolled before the chamberlain within the first year.

APPRONITRE, a kind of natural salt-petre, gathering, like an efflorescence, on old walls, now called salt-petre of the rock. See **SALT-PETRE**.

AQUA FORTIS, (GER. *Scheidewasser*. DU. *Sterkwater*. DA. *Skedevand*. SW. *Skedvatten*. FR. *Eau-forte*. IT. *Acqua-forte*. SP. *Agua-fuerte*. PORT. *Acqua-forte*. RUS. *Wodka Krepkaja*. POL. *Strychwaser*. LAT. *Aqua fortis*). See **ACID, Nitric**.

AQUA MARINA, or **AQUA MARINE**, a name by which the jewellers call the beryl, on account of its sea-green colour.

AQUA REGIA, (GER. *Königswasser*. DU. *Köningswater*. DAN. *Kongevand*. SW. *Kungswatten*. FR. *Eau Regale*. IT. *Acqua regia*. SP. *Agua regia ó real*. PORT. *Agua regia ou regal*. LAT. *Aqua regia*). See **ACID, Muriatic**.

AQUA SECUNDA, aquafortis diluted with water and employed in the arts.

AQUA SIMPLEX, or *Simple Water*, is aqua fortis that has been distilled, and has nothing left but phlegm. It is used in the mint, and by silversmiths, in order to begin to soften the grains of silver.

AQUATINTA, a method of engraving which very much resembles drawing in Indian ink. This process consists in corroding the copper with aqua fortis, in such a manner, that an impression from it has the appearance of a tint laid on the paper.

This is effected by covering the copper with a substance, which takes a granulated form, so as to prevent the aqua fortis from acting where the particles adhere, and by this means cause it to corrode the copper partially, and in interstices only. When these particles are extremely minute, and near to each other, the impression from the plate appears to the naked eye like a wash of Indian ink. But when they are larger, the granulation is more distinct; and as this may be varied at pleasure, it is capable of being adapted to a variety of purposes and subjects.

The matter generally used for this purpose, is composed of equal parts of asphaltum, and transparent rosin, reduced to powder and sifted on the plate, (which has been previously greased,) through a fine sieve. The plate is then heated so as to make the powder adhere, and the artist scrapes it away when a very strong shade is wanted, and covers those parts with varnish where he wishes a very strong light to appear. The aqua fortis, properly diluted with water, is then put on within a fence of wax, as in common etching for engraving, and by repeated applications, covering the light parts still with varnish; the effect is produced.

AQUA VITÆ, (GER. DU. DA. and SW. *Aquavit*. FR. *Eau-de-vie*. IT. *Acqua vite*. SP. and PORT. *Agua de vida*. RUS. *Wodka*. POL. *Gorzalka*. LAT. *Aqua vitæ*) answers to the *eau de vie* of the French, and *whiskey* of the Scotch, and is a name familiarly applied to all native distilled spirits. In this way it is used in the excise laws relating to the regulation of the distilleries.

AQUIFOLIUM, the *holly-tree*. From the bark of the *holly* is made a bird-lime, and the wood is used by turners, being very hard and white, and taking a smooth polish.

ARAINES, striped or checked armories or taffeties, which come from the East Indies.

ARANEA, a silver ore found only in Potosi, and in the single mine there of Catamito. It owes its name to some resemblance it bears to a *cobweb*, (a spider being called *aranea* in Latin,) being composed of threads of pure silver, which to the sight appear like a silver lace, when burned to separate the silk from it. It is the richest of all kinds of silver ore.

ARATE, a weight in Portugal. See **AROB**.

ARBITRAMENT, or **ARBITRATION**, is a power given by two, or more, contending parties, to some person or persons to determine the dispute between them. Matters relating to a freehold, debts due on a bond, and criminal offences, may not be arbitrated. If the party injured by a criminal act, however, proceed by way of civil action, as in assault or libel, &c. the damages may be submitted to arbitration; also in case of a

breach of promise of marriage. The *submission* to arbitration must be an agreement, or bond, upon a stamp, and must not be construed strictly, but largely, according to the intent of the parties submitted. It not uncommonly contains a clause to protect the arbitrators from any suit in equity that might be brought against them in consequence of their award; also one to enable them in case they cannot agree, to call in a third arbitrator, by mutual agreement, who is called an umpire. An action of debt may be brought for money adjudged to be paid by arbitrators.

Form of a Bond of Arbitration.

Know all men by these presents that I, A. B. of the parish, &c. in the county, &c. merchant, am held and firmly obliged to C. D. of, &c. in the county aforesaid, in the sum of — pounds, of good and lawful money of Great Britain, to be paid to the said C. D. or his certain attorney, his executors, administrators, or assigns, to which payment, well and truly to be made, I oblige myself, my heirs, executors, and administrators, firmly by these presents, sealed with my seal, dated at —, on the — day of —, in the — year of the reign of our sovereign Lord King George III. and in the year of our Lord God, one thousand eight hundred and —. The condition of the obligation is such, that if the above bound A. B. his heirs, executors, and administrators, for his and their parts and behalfs, do in all things well and truly stand to, obey, abide by, perform, fulfil, and keep the award, order, arbitrament, final end and determination of E. F. and G. H. arbitrators, indifferently named, elected, and chosen, as well on the part and behalf of the above-bound A. B. as of the above-named C. D. to arbitrate, award, order, judge, and determine of, and concerning all, and all manner of action and actions, cause and causes of actions, suits, bills, bonds, specialities, judgments, executions, extents, quarrels, controversies, trespasses, damages, and demand whatsoever at any time or times, heretofore had, made, moved, brought, commenced, sued, prosecuted, done, suffered, committed or depending, by or between the said parties, so as the said award be made, and given up in writing, under their hands and seals, ready to be delivered to the said parties, on or before the — next ensuing the date above mentioned: but if the said arbitrators do not make such their award of, and concerning the premises, by the time aforesaid, that then if the said A. B. his heirs, executors, and administrators, for his and their part and behalf, do in all things well, and truly stand to, obey, abide by, perform, fulfil, and keep the award, order, arbitrament, umpirage, final end, and determination of J. K. umpire, indifferently chosen between the said parties, of, and concerning the premises, and deliver the same in writ-

ing under his hand and seal, to the said parties, on or before the — next, ensuing the date aforesaid; then this obligation to be void, or otherwise to be, and remain in full force and virtue.

Signed, sealed, and delivered, A. B.
in the presence of L. M.
N. O.

NOTE.— If there be no umpire, the latter part must be omitted, viz. from “but if the said arbitrators, &c.” Though it is now customary to choose three arbitrators, and have them nominated in the bonds.

The aforesaid bond must be mutual between the said parties; and the following clause may be added at the end of the condition, as the agreement mentioned in an act of parliament made in the year 1698, viz. “And the above-mentioned A. B. doth agree and desire, that this his submission to the award above-mentioned be made a rule of His Majesty’s court of King’s Bench, (or any other court of record,) pursuant to the act of parliament for this purpose made and provided, and the like for the other party submitting to such award. See AWARD.

ARBITRATION of *Exchanges*. See EXCHANGES.

ARBITRATOR, is an extraordinary private judge, between party and party, chosen by their mutual consent, to determine controversies between them.

ARBOR, in mechanics, the principal part of a machine which serves to sustain the rest; also the axis or spindle on which a machine turns, as the arbor of a crane, wind-mill, &c.

ARCH, prefixed to any official designation, is an addition of dignity; as Arch-Duke, Arch-Bishop, Arch-Deacon, &c. and means nothing more than *principal*, being derived from a Greek word, signifying a *chief*.

An Archbishop is that person who has supreme power, under the sovereign, in all *ecclesiastical* causes; he is a principal bishop; the chief of the clergy within his province. It is the right of the Archbishop of Canterbury to call the bishops and clergy to convocation, upon the king’s writ: he has a jurisdiction in cases of appeal, where there is a supposed default of justice in the ordinary. He may confer degrees of all kinds, censure, excommunicate, suspend, and depose, for any just cause. He is the first peer of the realm, and has precedence, after the blood royal, before all the nobility of the realm.

ARCHIES, the Court of, is the most ancient, and chief, consistory court, belonging to the Archbishop of Canterbury, for debating spiritual causes. The judge of the court is styled the Dean of the Arches. He has extraordinary jurisdiction in all *ecclesiastical* causes, except what belong to the prerogative court; also all appeals from bishops, chancellors, deans, archdeacons, &c. &c. Beside these he has a peculiar jurisdiction

over thirteen parishes in London, exempt from the authority of the Bishop of London.

ARCHETYPE, the original or model, whence any performance is taken. It also signifies the original weight or standard, which is kept at the mint, and by which all other weights ought to be adjusted and examined.

ARCHIL, **ARCHILIA**. See **ORCHILLA**.

ARCHIVES, the *Rolls*, or any place where ancient records are kept; also the *Chancery*, *Exchequer Office*, or the private repository in libraries.

ARCTIC Pole, in astronomy, the north pole, or that elevated above the horizon in north latitude.

ARCTIC Circle, a lesser circle of the sphere parallel to the equinoctial, and 66° 30' distant from it towards the north pole.

ARDASSES, or **ARDASSINE**, the coardest of all the silks in Persia.

AREB, a nominal money used in accounts in India, equal to five shillings sterling.

ARECA, *Indian nut*. See **JAPAN EARTH**.

ARGOL, or **ARGAL**, (*GER. Weinstein. Du. Wynsteen. DA. Vinsteen. SW. Vinsten. FR. Tartre. IT. SP. and PORT. Tartaro. RUS. Winnii kamen. POL. Waystin. LAT. Tartarus*) tartar, or the lees of wine, used by dyers. See **DYEING**.

ARGIL, (*GER. Töpfererde. DU. Potilarde. DAN. Potteler. SW. Krukumakare-lera. FR. Terre à potier. IT. Terra da Stoviglie. SP. Tierra de alfareros. PORT. Barro. RUS. Glina*.) potters' clay. See **POTTERY**.

ARIDAS, a kind of taffeta, manufactured in the East Indies, from a shining thread, which is got from certain herbs, whence they are styled aridas of herbs.

ARISH, a measure of length in Persia, which Dr. Arbuthnot says is equal to 3197 English feet.

ARITHMETICK, the art of numbering. It consists of four fundamental rules, viz. addition, subtraction, multiplication, and division. Its origin may be a subject of curiosity to the learned, but can be of little use to the mercantile reader. Suffice it to say, that being essential to commerce, they were probably nearly coeval, so far at least as relates to *simple* arithmetick. The credit of inventing the ten figures, by which the science is executed, is attributed to Arabic origin. Decimal arithmetick is of comparatively modern invention, being unknown to the Greeks and Romans, and attributed to the Moors of Spain, from whom pope Sylvester II. is said to have borrowed it, and brought it into general use.

ARLET, a kind of cummin, for which there is some trade at Surat.

ARM, in respect of the magnet. A loadstone is said to be armed when it is inclosed, capped, or set in iron or steel, in order to increase its magnetic virtue.

ARM, in sea language. A ship is said to be armed when fitted out and provided in all respects for war.

ARMADA, a Spanish word, which formerly signified a number of ships of war; but of late years, it not only comprehends a navy composed of ships of war, but also a flota of merchant-men under their convoy. There is a royal *armada*, or navy, to secure the navigation of the galleons from Old Spain to the Spanish West Indies.

ARMAMENT, a formidable body of forces, completely furnished with arms, &c. either for the sea or land service.

ARMOISIN, a silk stuff, or kind of taffeta, manufactured in the East Indies, at Lyons in France, and Lucca in Italy. That of the Indies is slighter than those made in Europe.

ARMORIAL BEARINGS, certain symbols used in heraldry, for marks of dignity and honour, and borne on banners, shields, coats, &c. for the distinction of persons, families, officers, corporations, cities, and states. The king, as the fountain of all honours, bestows these distinctions in these kingdoms; and the laws, regulations, and cognizance of all matters relating thereto, belong to the earl marshal and college of arms. This college was incorporated by charter of king Richard III. confirmed by king Edward VI. and enlarged by king Henry VII.

Armorial bearings were made a subject of taxation by 43 Geo. 3. c. 161., and are rendered liable to the duties thereby imposed, whether registered in the college of arms or not. They are as follows: £. s.

By every person chargeable with any duty for a carriage	2 8
By every person not chargeable for a carriage, but chargeable for those on houses or windows	1 4
By every person not chargeable to the duties on carriages, houses, or windows	0 12

ARMORINGS, in a ship, are the same as waste cloths, which are red cloths hung about the outside of a ship fore and aft; there are also some hung round the tops, called *top-armorings*.

ARMOUR, denotes all such habiliments as serve to defend the body from wounds, especially of darts, a sword, a lance, &c. A complete suit of armour formerly consisted of a helmet, a shield, a cuirasse, a coat of mail, a gauntlet, &c. all now laid aside.

ARMOURER, he that makes arms. The company of this name is united with that of the braziers.

ARMOURY, or **ARMORY**, a magazine or store-house, wherein arms and other warlike stores are deposited.

ARMS. Under the definition of arms, are comprehended not only all offensive and defensive weapons, but also all the warlike ammunition, which of all merchan-

dize that can be taken into a ship, are the most hazardous, being more generally contraband than any other article of commerce; for the exportation and clandestine importation are strictly forbidden in most countries; and in many the exportation is attended not only with confiscation of ships and cargo, but with heavy fines and imprisonment. Arms, ammunition, or gunpowder, may be prohibited to be exported at the king's pleasure. — 12 Car. 2. c. 4. s. 13. See *ante*, AMMUNITION.

AROBÉ, or ARROBE, (in Spanish *Arroba*, in Peru *Arroue*), is a weight used in Spain, Portugal, Goa, and throughout all Spanish America. The arobe of Portugal is 32 Lisbon lbs.; of Spain, 25 Spanish lbs. See WEIGHTS and MEASURES.

AROUGHCAIN, an animal found in Virginia, which resembles the beaver, except that it feeds, and leaps, upon the trees like the squirrel. The English merchants value its fur, which forms a branch of their trade with the Indians.

AROURA, a Grecian measure of fifty feet. It was more frequently used for a square measure of half the plethron. The Egyptian aouroua was the square of 100 cubits. — *Arbuthnot*.

ARPENT, a term sometimes used to denote an acre, from the French *arpent*.

ARQUEBUSE, or HARQUEBUSE, a firearm, of the same length as a fusee or musket, which is commonly cocked with a spring-lock.

ARQUIFOUX, (GER. *Bleyglanz*. DU. *Lootglans*. DA. *Blyglands*. SW. *Blyglans*. FR. *Arquifou*. IT. *Archifoglio*. SP. *Alquifol*. PORT. *Arquifolho*. RUS. *Kubikowataia ruda*. LAT. *Galena*.) called also *Alquifou*, or *Arquifou*, a sort of lead ore, very heavy, easily reduced into powder, and hard to melt; when it is broken, it parts into shining scales, of a whitish colour. The potters use it to give their works a green varnish; and in England it is commonly called *potters' ore*. The *arquifoux* is exported from England in large lumps; it should be chosen heavy, the scales bright and resembling tin-glass. This article is found in Alais and Languedoc in France, also in Barbary and Sardinia.

ARRACK, or RACK, (GER. DU. and SW. *Arrak*. DA. *Arack*. FR. *Arack*. IT. *Aracco*. SP. RUS. and POL. *Arah*. PORT. *Araca*.) a spirituous liquor imported from the East Indies, used as a dram and in punch. The word arrack, according to Lockyer, is an Indian name for strong waters of all kinds; for the Indians call our spirits and brandy English arrack. But what we understand by the name arrack, he affirms, is properly no other than a spirit produced by distillation from a vegetable juice called toddy, which flows by incisions out of the cocoa-nut tree, like the birch juice procured among us. The toddy is a pleasant drink by itself, when new, but

purges those who are not used to it; when stale it is heady, and makes good vinegar. The English at Madras use it as leaven to raise their bread with.

There are, however, several kinds of arrack, distinguished by different names; such as Batavia arrack, which is a vinous spirit obtained by distillation from rice and sugar, fermented with the juice of cocoa-nuts. It is a strong spirit; but being made in copper stills, is not so agreeable as Goa arrack. Bitter, black, and Columbo arrack, are hot spirits, little valued, and seldom imported by Europeans. The manner of making the Goa arrack is this: The juice of the trees is not procured in the way of tapping as we do; but the operator provides himself with a parcel of earthen pots, climbs up the trunk of a cocoa-tree; and when he comes to the boughs, he cuts off one of the small knots or buttons, and applies the mouth of a bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off others, and proceeds till the whole number is employed: this done, he leaves them until the next morning, when he takes off the bottles, which are mostly filled, and empties the juice into the proper receptacle. When a sufficient quantity is produced, the whole put together is left to ferment. When the fermentation is over, and the liquor or wash is become a little tart, it is put into the still, and fire being made, the still is suffered to work as long as that which comes off has any considerable taste of spirit. The liquor thus procured is the low wine of arrack; and is distilled again, to separate some of its watery parts, and rectify it to that very weak kind of proof-spirit, in which state we find it. The arrack we meet with, notwithstanding its being a proof test, according to the way of judging by the crown of bubbles, holds but a sixth, and sometimes but an eighth, part of pure spirit; whereas our other spirits, when they shew that proof, are generally esteemed to be one half pure spirits.

Arrack is subject to the same excise laws as all other kinds of foreign spirits.

Arrack, *tungusian*, is a spirituous liquor made by the Tartars of Tungusia, of mare's milk, left to sour, and afterwards distilled twice or thrice between two earthen pots closely stopped, whence the liquor runs through a small wooden pipe. It is more intoxicating than brandy.

ARRAIGNMENT. To arraign, is to call on a prisoner, who stands at the bar of a court of justice charged with some felonious offence, to answer the matter alleged against him. He is called upon to hold up his hand, but only in token of his acknowledging himself to be the person accused; and his identity may be otherwise proved if he refuse this acknowledgment. 2 Hale. P. C. 219.

When these preliminaries are gone

through, the indictment, or formal written accusation, is distinctly and deliberately read to him; and he stands mute, or he confesses the fact (both which are put on the same footing by 12 Geo. 3. c. 20.), or he pleads to the indictment that he is not guilty of the offence charged. The jury are then required, on their oaths, to try the question, and to find a verdict of condemnation or acquittal.

ARRANGOES, a kind of beads, formed from the rough cornelian, or some stone of that nature, chiefly in demand for the African trade.

ARREARS, or **ARREARAGES**, is taken for money unpaid at the due time, as rent behind. The remainder due on an account, or of a sum of money remaining in the hands of an accountant. It likewise signifies what remains unpaid of pensions, taxes, or any other money payable yearly, or at a fixed term.

ARREST, is the commencement of imprisonment, when a man is taken and restrained of his liberty by a warrant, in execution of the command of some court, or some officer of justice.

Arrests are of two kinds, *civil* and *criminal*. Arrest in any civil suit can only be by precept out of some court; but in criminal cases by the single authority of an officer of justice, of a superior, or inferior, degree, according to the nature and tendency of the crime.

Arrest in a Civil Suit. An arrest should be by corporal seizing or touching the body, because *after that* a bailiff may justify breaking open a house to take the person, but any acquiescence is *sufficient in civil process*. In all cases, however, the door of a mere lodger in the house of another may be broken open, having first gained peaceable entrance at the outer door of the house; but not if the whole house be let out into separate apartments, for they will then generally be considered as separate houses. 3 *Black. Com.* 289.

There are many descriptions of persons privileged from arrest in civil suits. Peers of the realm, members of parliament, and corporations. *Ibid.* Peers of parliament, peeresses by birth; and also by marriage, not having forfeited their rank by having married a commoner. 1 *Inst.* 131. 2 *Inst.* 50. Scotch peers of parliament. 5 *Anne.* Irish ditto. 39 and 40 Geo. 3. Clergymen performing divine service, or attending convocation. 50 *Edw. 3.* 1 *Rich. 2.* 8 *Hen. 6.* Ambassadors and their servants. 7 *Anne.* *Hopkins v. De Roebuck.* 3 *Term R.* 79. All servants of the king, even though they carry on trade, and contract the debt in the course of that trade. *R. v. Forster.* 2 *Taunt. R.* 167. Barristers upon their circuits. *Markins v. Smith.* 1 *Black. Rep.* 636. Clerks, attornies, and others, actually practising, and virtually attending courts of justice. 5 *Black. Com.* Archibald's Edit. 289. 4 *Burr.*

R. 2109. Suitors, witnesses, and other persons, necessarily attending a court of justice, as well during trial, as for a reasonable time before, and after. 3 *Black. Com.* 199. *Childerston v. Barrett.* 11 *East. R.* 439. Bail attending to justify. *Rimmer v. Green.* 1 *M. & S. Rep.* 658. Witnesses attending in arbitration under a rule of court. *Spence v. Stuart.* 3 *East. R.* 89. Soldiers attending courts martial as witnesses; as also soldiers for debts under 20*l.* *Ann. Mut. Act.* Bankrupts coming to surrender, and 42 days after; also for such longer time as the commissioners shall enlarge it to, for further examination. *Davies v. Trotter.* 8 *Term. R.* 475. No person may be arrested for any debt under 15*l.* except it be on a bill or note, by 57 Geo. 3. c. 101. Nor on a Sunday, except for treason, felony, or a breach of the peace, by 29 Car. 2. c. 7.

Such is the outline of the direct privilege from arrest in civil suits. There are other cases where an exemption or liberation from arrest may ensue indirectly from various causes, but they are foreign from the nature of a mere elementary book.

Arrest on Criminal Cases, may be by warrant, or without warrant, according to the nature of the crime, and the circumstances of the case.

A warrant may be granted in extraordinary cases by the privy council, and secretaries of state; but it is ordinarily granted by justices of the peace; and this authority extends to all treasons, felonies, and breaches of the peace. 2 *Hale. P. C.* 108. Also to all crimes of which justices in session have cognizance. *Dick. Pract. Exp. v. 3.* p. 89.

And an information on oath upon suspicion is sufficient to justify the issuing of a warrant, and all constables and others executing it within the jurisdiction are indemnified. 4 *Black. Com.* 290.

A warrant from the justices of the Court of King's Bench extends all over the kingdom, but the warrants of justices of the peace only extend over the jurisdiction for which they are appointed; but a warrant issued by a justice in one jurisdiction may be rendered valid in another, by the indorsement of a justice for the jurisdiction in which it is intended to be executed. 4 *Black. Com.* 292.

A warrant should be under hand and seal, should set forth the time and place, when and where issued, and also the substance of the information, sufficiently to give the offender due notice of the charge against which he is to make his defence; as also if it be a bailable offence, that he may be provided with sureties. *Dick. Pract. Expos. v. 2.*

But an arrest in many cases is lawful without warrant, especially by officers of justice of all degrees and denominations. Justices of the peace may apprehend, or authorise and command any other persons to apprehend, offenders committing any kind

of felony, or breach of the peace, *in their presence*. Constables, also, of their own authority may apprehend persons committing felony, or on strong suspicion thereof; persons breaking the peace; night-walkers of suspicious appearance; and persons committing acts of vagrancy, in order to their being carried before a justice of the peace. 2 Hale. P. C. 96.

Private persons, without any official authority, may lawfully apprehend, for the purpose of carrying before a justice, all persons committing felonies, or breaches of the peace, in their view; and even on very strong suspicion, without view, they will be justified in apprehending them, but cannot justify breaking open doors, so to do, on suspicion only. *Cald. Ca.* 291.

ARROBA. See AROBE.

ARSCHEIN, a long measure used in China to measure stuffs. Four *arschins* make three yards of London.

ARSENAL, a place where all kinds of warlike stores are kept in fortified towns.

ARSENIC, (GER. *Du. Da. Sw.* and *Pol. Arsenik. Fr. Arsenic. It. Sp.* and *Port. Arsenico. Rus. Mischjak. LAT. Arsenicum*.) a metal of a light lead-blue colour; by exposure to the air it readily tarnishes, the later as it is the purer, and becomes first yellow, and then black and pulverulent: this change takes place in consequence of its great affinity for oxygen. Its hardness is about equal to that of copper, but it is quite brittle, and very easily pulverizable. Slowly sublimed in close vessels, it crystallizes in octohedrons. Its specific gravity is 8.310. Of all metals it is the most volatile by heat, for it begins to rise in fumes at about 356° Fahrenheit; that is, long before it melts, so that it can hardly ever be seen in a state of fusion.

Arsenic is a substance of very frequent occurrence, being found in combination with almost every other metal, as well as with sulphur and lime: the four following species, however, are the only ones that, by the common consent of mineralogists, are ranked as ores of this metal, the rest being considered as arsenicated ores of silver, copper, cobalt, &c.

SP. 1. *Native Arsenic*. The colour of this mineral, when newly broken, is a light lead grey. It occurs generally in mass: it does not form crystals. Its surface is rough, or granular: it acquires a polish by friction. Specific gravity 5.724 — 5.763.

This mineral is found only in the veins of primitive mountains, accompanied by red silver, realgar, galena, specular cobalt, pyrites, &c. It occurs in the mines of Freyberg, in Saxony; at Geisberg, in Carinthia; at Nagyag, in Transylvania; and at St. Marie aux Mines, in France.

SP. 2. *Arsenical Pyrites, Marcasite, or Mispickel*. The colour of this mineral is silvery white. It is met with in masses, dis-

seminated, and not unfrequently crystallized: it is hard and brittle. Specific gravity 6.52.

It is found in almost all metalliferous primitive mountains; but the variety containing silver has hitherto been met with only at Freyberg and Braunsdorf, in Saxony.

SP. 3. *Sulphuret of Arsenic*. There are two varieties of this, called realgar and orpiment.

Realgar is of a bright aurora red colour, passing on one side into scarlet, on the other to light orange. It is found rarely in mass, more frequently disseminated, or investing, but most commonly crystallized. Its primitive crystals are long octohedrons, with scalene triangular faces. It is very tender and brittle, and may be easily broken by the nail. Specific gravity from 3.2 to 3.3. Realgar occurs native in the vicinity of Ætna and other volcanoes, and in the primitive mountains of Germany, Switzerland, and Hungary. The substances by which it is usually accompanied are, native arsenic, red silver, and galena.

Orpiment differs from realgar in the following particulars. Its colour is a bright lemon yellow, passing into gold yellow and aurora red. It is found disseminated or in mass: its internal lustre is very brilliant. Its specific gravity 3.4.

It is always found in stratified mountains, accompanied by clay, quartz, &c. and appears to be a mineral of late formation. It is procured from the Bannah, from Servia, from Nagyag in Transylvania, and Felsőbanga in Hungary. The Romans procured this beautiful bright gold-coloured orpiment from Syria, and esteemed it highly as a pigment.

SP. 4. *Native White Arsenic*. Its colour is snow-white, or slightly red and yellow white, or smoke-grey. It is commonly found in the state of a friable earthy crust, on the surface of other minerals; it is also occasionally met with stalactitic, clustered, or in minute bundled capillary crystals. In the earthy state it is opaque, but when crystallized it is translucent. It is friable and very brittle. Specific gravity 3.7.

This mineral is of rare occurrence, having hitherto been met with only in the cobalt mines of Bohemia and Saxony, and on the surface of native arsenic in Transylvania and Hungary.

Arsenic has no smell when cold, but when heated it exhales a very strong odour, resembling that of garlic.

Arsenic is sometimes used as a medicine, and when judiciously employed, is capable of producing the most powerful and beneficial effects. It forms the basis of the *tasteless ague drops*, a medicine well known for its efficacy as a remedy for intermittent fever. It is, however, a substance frequently used intentionally for the destruction of life, which a very small quantity is able to effect: it is therefore important in a juridical point of view, that the presence of

it in minute quantities should be ascertainable with certainty and precision. The most accurate test is the ammoniaco-nitrate of silver; a preparation which may be obtained from any chemist. It is to be applied in the following manner.

The liquor supposed to contain arsenic is to be made as clear as possible by straining, &c. and a small quantity of the ammoniaco-nitrate of silver added to it; a *yellow* precipitate is instantly produced, which on exposure to the air becomes a little darker in colour, and assumes a *curdled* appearance. The same preparation produces a yellowish precipitate from a solution of phosphate of soda; but this becomes nearly black after being exposed to the air for some hours, and it has the appearance of a *powder*. Were the similarity between the products in this process even greater, it is not probable that any difficulty would thence arise, as phosphate of soda is not likely to be contained in the fluids of the stomach under the circumstances in which the test is to be employed. It will, however, be proper to employ one, or more, of the following tests, in support of the one above described. To the suspected liquor, add a very small proportion of carbonate of potash; after this has stood a few minutes, drop in a small quantity of sulphate of copper; if it contain arsenic, a bright yellowish green precipitate, termed *Scheele's green*, will be immediately produced. A stream of sulphurated hydrogen gas, passed through the liquor containing arsenic, produces a golden yellow precipitate. The following, proposed by Brugnatelli, appears to be a very delicate one. To a mixture of fresh wheat starch and water, add a sufficient quantity of *iodine* to give the liquid a lively blue colour: a solution of white arsenic (the preparation usually employed as a poison) added to this, turns it to a reddish colour; the same change is also effected by a solution of sublimate of mercury, but where the change has been produced by arsenic, the blue colour will be restored by the addition of a few drops of sulphuric acid; but this will not happen where it has been produced by sublimate of mercury.

Arsenic is much employed in the arts; it is used as an alloy with copper, which forms a malleable and flexible metal that takes a fine polish. On account of these properties, this mixed metal is frequently employed for making sundry articles which are designed to be heated with silver. It enters into most compositions for the specula of reflecting telescopes, and for other optical purposes. It is employed in the manufacturing of small shot to make it more brittle and granulate better. Its oxides are used in many processes of the dyer, and in the manufacture of glass. Sulphuret of arsenic is much used in calico-printing, on account of its property of de-oxydizing in-

digo, and thus rendering it soluble in an alkaline solution. The same preparation of arsenic is also employed in the composition of several valuable pigments.

ARSON is, technically, the wilfully, maliciously, and *actually*, burning of the *house* or *outhouse* of another man; and was always a felony by the common law of the land. The word, however, has *outgrown* its original interpretation, having been extended by divers statutes to other offences of burning, and attempting to burn, beyond mere houses and outhouses.

By 23 Hen. 8. c. 1. and 32 Hen. 8. c. 3. wilfully burning *houses or barns wherein corn shall be*, was declared to be felony without benefit of clergy. The provisions of this statute were extended by 4 & 5 Phil. & M. c. 4. to such as should maliciously command, hire, or counsel, any other person to commit any of the offences enumerated in the former statute. The punishment of arson was extended to the burning, or causing to be burned, *any stacks of corn or grain* in any of the counties of Cumberland, Northumberland, Westmoreland, or Durham, by 43 Eliz. c. 15. By 22 and 23 Car. 2. the punishment was extended to offences in *all parts* of the kingdom, if the attempt were made in the night-time; and *kilns* were also by it placed under the protection of the law.

The 9 Geo. 1. c. 22. made perpetual by 31 Geo. 2. c. 42. extends the punishment of felony without benefit of clergy to all who shall *set fire* to any house, barn, outhouse, hovel, cock, mow, or stack of corn, straw, hay, or wood, or procure any person so to do, or shall forcibly rescue any person in custody for the same.

Mills are placed under similar protection by 9 Geo. 3. c. 29.

Vessels and docks, by various statutes, 12 Geo. 3. c. 24., 33 Geo. 3. c. 67., 39 Geo. 3. c. 69., and 39 and 40 Geo. 3. c. 47.

But the most important statute, because made to meet an increasing evil, (*viz.* that of persons insuring houses and other premises and then burning them in order to defraud the insurers,) is 43 Geo. 3. c. 58. by which it is enacted that "if any person shall wilfully, maliciously, and unlawfully set fire to any house, barn, granary, hop-vat, malt-house, stable, coach-house, outhouse, mill, warehouse, or shop, (whether in the possession of the offender or any other person,) with intent thereby to defraud his majesty, or any of his subjects, or any body corporate, then the person so offending, his counsellors, aiders, &c. shall be felons and suffer without benefit of clergy.

ARSURE, the trial of money by fire after it was coined. In doomsday we read, "*reddit 50l. ad arsuram*," which is meant of lawful and approved money, whose alloy was tried by fire. — *Cowell, ed. 1727.*

ARTICLE, a small particle of an ac-

count contained in the journal, invoice, &c. Thus it is said "such an account contains so many articles of debtor, and so many of creditor. The bill of parcels or invoice sent, contains so many articles, amount, so much," &c.

Article is also said of the clauses, terms, and conditions, agreed upon in partnerships, bargains, and treaties, and also of the things adjudged by arbitrators. In this sense, they say, "in the bargain we have made together there is an article, by which you are bound to such a thing. This is according to an article of our treaty. Our arbitrators have determined such an article in my favour," &c.

ARTICLES OF THE PEACE, an accusation written on parchment, and exhibited to the judges of the court of King's Bench, or to the justices assembled in session, requiring sureties to be produced before them, by some person whom the complainant charges with a design to break the peace, and to do some bodily injury to him the complainant, &c. *See further, title PEACE.*

ARTICLES OF WAR. The codes of law also by which the forces of the kingdom, by land and by sea, are governed, are denominated *articles*. The articles of war for the regulation of the army, are framed from time to time at the pleasure of the crown. The articles for the government of the navy are by statutes of parliament. It is unnecessary to enter further into the subject here, but *see 1 Black. Com. 420.*

ARTIFICER, a person whose employment it is to manufacture any kind of commodity, as in iron, brass, woollen, &c.; such are smiths, weavers, carpenters, &c. Persons that contract with artificers in wool or metals to go out of the kingdom, shall be fined in any sum not exceeding 100*l.* and imprisoned for three months. If artificers that are abroad do not return in six months after warning, they shall be deemed aliens, and be incapable of inheriting lands by descent. By several acts passed during the present reign, several penalties are inflicted on masters of ships assisting to seduce artificers to leave these realms *See 21 Geo. 3. c. 57., and 22 Geo. 3. c. 60.*

Artificer, in a military sense, he who prepares bombs, grenades, &c.

ARTILLERY, signifies all sorts of great guns or cannon, mortars, howitzers, petards, and the like, together with all the apparatus and stores thereto belonging, which are not only taken into the field, but likewise to sieges, and made use of, both to attack, and defend, fortified places. It signifies also the Science of Artillery or Gunnery. *See FOUNDRY.* As artillery comes under the articles of arms and utensils of war, &c. they cannot be imported without licence from his majesty; and if

otherwise, the whole is not only forfeited, but treble the value. 1 *Jac. 2. c. 8. sect. 2.*

ARTS, MANUFACTURES, AND COMMERCE, a society for the encouragement of, was instituted in London, A.D. 1754, and continues to be of the greatest service, through the encouragement given by it to the exertions of genius and the perseverance of industry, in premiums of different descriptions.

ASBESTUS, ASBESTOS, or **AM-ANTHUS**, in Natural History, is a kind of fossil stone or mineral substance, of a whitish colour, and woolly texture, consisting of small filaments, and endued with the wonderful property of resisting fire, and remaining unconsumed in the most intense heat. This mineral is not only found in several parts of Italy, but also in India, Tartary, Siberia, Egypt, Greece, France, the Netherlands, the Isle of Anglesea in Wales, Scotland, and many other parts of the world. It is sometimes called in English, *earth-flax*, and *salamander's wool*.

The industry of mankind has discovered a method of working this fibrous mineral, and employing it in divers manufactures, chiefly cloth and paper. The cloth made of this incombustible matter was in great esteem among the ancients, and better known, and more common than at present. Pliny says, he himself had seen napkins of it, which being taken foul from the table, and thrown into the fire, were by that means rendered as clean as if washed in water. But the principal use of it, according to the same author, was to make shrouds to wrap up the corpses of kings, &c. in order to preserve their ashes distinct from those of the fuel, which composed the funeral pile; and it is said the Tartars still use it in burning their dead.

ASH, a timber tree, which in a strong soil grows to a prodigious height and bulk. It is improper for beams or rafters, or for any architectural purposes, because it sways or bends with its own weight; but is extremely useful in agriculture. Almost all the implements of husbandry are made of it, from carts and waggons to fork shafts. It is also much used by coachmakers, for poles and shafts of carriages, as well as for the felines of wheels, being light and tough. But the principal purpose to which it is applied, and in which it is an article of considerable commerce, is for hoops to barrels, tubs, and vessels of every description. Indeed, except where iron is used, they are almost exclusively manufactured of ash.

Plantations of underwood, for poles, are chiefly of ash, and are extremely profitable, as they will bear cutting down about every ten years, and are in high estimation for hop-poles, hedge-stakes, and other purposes of husbandry.

ASHES, (*Fr. Vedasse. GER. Waidasche. Du. Weedas. DA. Veedaske. SW. Dräg-gaska. Ir. Feccia bruciata. Sp. Alumbre*

de lez. PORT. *Cinza de tartaro.* Rus. *Weidasch.* POL. *Smelcuga.* LAT. *Cineres infectorii*;) the earthy part of wood and other combustibles, remaining after they are consumed by fire. These, if produced from a vegetable, are of a white colour and saltish taste, a few instances excepted, and contain more or less vegetable alkali, which is for the most part potash. Iron may also be obtained from them.

Ashes of all kinds contain an alkaline salt, and are an excellent manure for cold and wet ground. See ALKALI.

ASHLAR, a term used by builders, by which they mean common free-stones, as they come out of the quarry, of different lengths and thickness. Nine inches is the common thickness.

ASHERING, with builders, quartering to tuck in garrets, about two feet and a half or three feet high, perpendicular to the floor, up to the under-side of the rafters.

ASIA. This division of the globe, which in extent exceeds Europe and Africa, and which is famous in history for having been governed by the Assyrians, the Medes, the Persians, and the Greeks, comprehends now four vast empires, viz. those of China, Japan, Persia, and Indostan or India; beside other countries, possessed by the Turks and European powers, and several islands.

This continent is bounded on the north by the Frozen Ocean; on the west by the Red Sea, the Mediterranean, the Black Sea, &c. &c.; on the east by the Pacific Ocean; and on the south by the Indian Ocean.

Asia is certainly more favoured by nature than any other quarter of the terrestrial globe in many of her productions; for here she has lavished to excess, what are either not to be found at all, or, at most, sparingly, in the three other divisions. Its air is serene, its soil most fertile, and every luxury of life is abundantly enjoyed. Precious stones of every description, the precious metals, copper, iron, brimstone, salt-petre, alum, mercury, silk, cotton, gums, spices, sugars, the most fragrant herbs, and the most delicious fruits. Tobacco is universally cultivated, and universally used.

The principal regions into which this continent may be divided, are China, Japan, Tartary (Chinese, Russian, and Independent), India *beyond*, and on *this side*, the Ganges, Persia, Asiatic Turkey, distinguished into Eastern and Western. Except in such parts of this continent as are subject to European powers, Christianity is not professed. The Chinese worship Confucius, the Persians the Sun, the Turks and Arabians Mahomet: there are great numbers of Pagans, and Jews every where abound. As to the language of Asia, almost every country has its own. There is the Turkish, the Arabic, modern Greek, the Chinese, Japanese, Russian, Tartarian, Persian, Malayian, &c. &c.

The eastern side of this continent, in which are comprehended the Chinese and Japanese empires, eminently abounds in all the productions of nature which have been enumerated, but there are a few which merit peculiar distinction above the rest. First, the tree which bears a name signifying the *iron wood*. This tree grows to the size of an English oak: its wood is so *heavy*, that, if put into water, it sinks; so *hard*, that the anchors of the Chinese vessels are made of it; and so *durable*, that it is used for columns instead of stone. Secondly, the bamboo cane, which grows to an immense size. The large ones are bored, and made into pipes for the conveyance of water, while the small ones are converted into articles of furniture and ornament in various ways. Thirdly, the tea tree. This is more correctly a shrub than a tree, seldom exceeding eight feet, even when not restrained by artificial means to that height. This shrub is an evergreen, is in its greatest beauty from October to January, bearing a flower not unlike our wild white rose. There are only two kinds, the green and the dark coloured; and beyond this, all the varieties which we have in England are only produced by separations of the younger from the older leaves, the periods of gathering them, and the care with which they are dried and prepared. The small leaves gathered the beginning of March, being young and small, make the finest article; those in April, the second sort; and those in May, the coarsest. These are all again separated even in the gathering; for each leaf, tedious as the process may appear, is plucked from the branch by itself.

Of manufactures in this part of the continent, porcelain, lackered cabinet work, ink, paper, and silk, and fine matting of various descriptions, seem to be pre-eminent. Their paper is nothing more than the inner bark of trees, especially the cotton tree, laboriously prepared by soaking in water, bleaching, boiling, steeping in an infusion of alum, and then drying in moulds of an extraordinary size.

The extent of the empire of China is said to be in square miles 1,297,999; in English acres, 830,719,560: its number of inhabitants to be 333,000,000; and its revenues to be 12,140,625*l.* annually.

In a commercial point of view, we have little to do with any part of China but the city of Canton, capital of the province of Quang-ton, situated on one of the finest rivers of this immense empire, and the only port which Europeans are permitted to enter. It consists of three towns, divided by high walls, but so conjoined as to form nearly a square. The streets are regular, and terminated by barriers which are closed every evening. The number of inhabitants is said to exceed a million and a half; a very large proportion of whom live in

habitations constructed upon rafts, and moored in the river. All the foreign trade of the empire being conducted here, it draws together merchants and merchandize from all parts, and the influx of wealth is therefore incalculable. The exports are chiefly as follow : — Silks, stuffs, manufactured and unmanufactured cotton, muslins, tea, camphor, musk, flax, sugar, salt, preserved ginger, quicksilver, vermilion, lapis lazuli, vitriol, ambergris, toutenague, rhubarb, plums, China root, mirabolans, Indian ink, porcelain, lackered and japaned wares, camlets, hemp, fine gold, pewter, iron, steel, several implements made from the aforesaid metals, precious stones, pearls, very beautiful marble, eagle, and Brazil wood, ebony, Jesuits' bark, yellow and reddish amber, and horses.

The commodities sent from Petersburg to China, are jewels of several sorts, sables, white and common fox, lynx, beaver, ermine, minever, badger, seal skins, and some teeth of the last-mentioned animal. The other imports of China are silver, which is brought from Mexico by the South Sea to the Manillas, in piastres and bars, and thence hither ; the Chinese, who have none of this precious metal produced in their own country, esteem it very highly, and willingly exchange for it gold and other valuable merchandises. The English East India Company, and the Americans, send them tin, lead, bullion, and dollars. There are also imported linens of various descriptions, cloths, serges, sandal wood, elephants' teeth, red coral of a pale cast, spice, pepper, &c. &c.

There is but one piece of coin in China, which is made of base metal, and called *cash* : it is made for paying labourers, and small payments in the bazaar. 10 *cash* make a *candarine*, and 10 *candarines* make a *taïe*, 3 of which are equal to a pound sterling.

The *cash* are composed of 6 parts of copper and 4 of lead, are round and stamped on one side, with holes in the middle, so as to string them.

Gold is not considered in China as money, but as merchandize. Silver is used, but not in coin, only in separate pieces of bullion, which are estimated in value by weight and quality.

The centre of this continent to the south is washed by the waters of the Bay of Bengal and the Arabian Sea, and generally known by the common appellation of *Indée*. These regions are separated from China, Tartary, and Persia, by a chain of immense mountains. The coasts of Coromandel to the east, and Malabar to the west, form two sides of a triangle, within which the Indian empire commences southward, and stretches northward to the confines of Tartary.

Madras, or *Fort St. George*, is the princi-

pal settlement of the East India Company on the east side of Indostan, or the Coromandel coast. It is a fortified place, and of considerable strength, surrounded by a wall, defended with batteries, bastions, &c. well supplied with cannon. There are two towns, the White and the Black ; the former consisting of Europeans, chiefly British ; the latter of Gentoos, Mahometans, Armenians, and Jews. Here are barracks for soldiers, an hospital, and a mint ; but no port for shipping. It was settled by the English in 1640 ; afterwards was in the hands of the French ; but has been part of the English East India Company's territory ever since 1748.

The goods of the country, and those collected from their other factories on this coast, or what their trade in India has brought hither, are, silk stuffs, silk and cotton handkerchiefs, cotton in thread and wool, indigo, all sorts of muslins and calicoes, Masulipatnam chintz, reckoned the most beautiful made in the Indies, diamonds and other precious stones from the mines of Golcondo, &c. &c. The chief imports of Madras are, camlets, cloths, serges, hats, worsted stockings, crystals, Flanders' lace, perpetuanas, silver, Japan copper, fine gold, Malacca pewter, quicksilver, lead, vermilion, camphire, elephants' teeth, &c. &c.

Accounts are here kept in star pagodas, fanams, and cash : 80 cash make one fanam, and 42 fanams the star pagoda.

Bengal is bounded by the bay of that name to the south, is situated in a vast plain of the most fertile soil, bearing two, and even three crops per year ; the Ganges, like the Nile, dividing into several streams, and overflowing the plain. The great articles of indigenous produce consist of sugar, fruit, pepper, opium, rice, salt-petre, silk, lac, and civet. Bengal has been subject ever since 1765 to the English East India Company.

Calcutta is the capital, where are a garrison of soldiers, an hospital, magazines, and storehouses. It is situated on one of the branches of the Ganges. The water about Calcutta is brackish, and the climate unhealthy, but, nevertheless, many of the wealthiest merchants reside here. A bank is established here, and great commercial speculations are carried on. There are many beautiful villages about Calcutta, where the merchants have country houses for the benefit of a better air. The exports from this part of the continent are diamonds, crystals, raw silks, cotton, wool, and thread, wax, indigo, various perfumes, and medicinal drugs, rice, salt-petre, sugar, embroidered stuffs, carpets, and counterpanes, calicoes, and muslins, sweetmeats, precious stones, &c. &c. and they import all the valuable commodities of the other parts of Asia and of Europe, and, strange to say, among the rest, the muslins of Britain,

which they can import upon more reasonable terms than they can manufacture them.

Accounts are kept in Bengal in current rupees, each rupee consisting of 16 current annas, and each anna of 12 current price. All specie must be reduced into this currency before any sum can be entered into books of accounts.

Cowries, a species of sea-shells, are used for paying labourers, and other small accounts.

	Cur. Rup.

A lack is composed of 100,000 rupees.	

Bombay (an island) is situated at the north-western extremity of the Malabar coast, and is the only place of importance on it (except *Goa*, belonging to the Portuguese). It was the dowry of Catherine of Portugal, who married our king Charles II., and is one of the three Presidencies of the English East India Company, by which their oriental territories are governed. It has a harbour which will contain a thousand ships, and the city is surrounded by a wall and ditch, and has a pretty good castle, a dock-yard, and a marine arsenal. The finest ships, constructed of the famous teak wood, are constructed here. The land is principally occupied by groves of cocoa trees, rice fields, and onion grounds. The town itself is about a mile in length, divided into three parishes, and the inhabitants are of all countries and all religions.

The exports of the coast of *Malabar* are sandal-wood, Indian saffron, cardamoms, pepper, ginger, cinnamon, muslins, betel, white areca (red for dyeing), &c. The black and white rice, which make a very considerable part of its trade, is gathered here twice a year, besides a quantity of excellent fruits, which serve for the shipping's refreshment. The cardamoms are gathered at Cananor, which was ceded by the Dutch to the English in 1792, and is supposed to be the only spot in the world where they are found. The cinnamon is not near so good as that of Ceylon. The imports are the merchandises of Europe in general.

Accounts are kept at *Bombay* in rupees, each rupee consisting of 4 quarters, and each quarter of 100 reis. At *Goa* in pardoes of 240 reis.

At the western extremity of this continent, the two *Arabias* (distinguished by the names of Felix, and Desert) are separated from the kingdom of *Persia* by the Persian Gulph, and bounded on the contrary side by the Red Sea; the approach to which is by the Streight of Babelmandel, on which stand the two towns of *Aden* and *Mocha*; both places celebrated in former times for their traffic, which, indeed, is even still not inconsiderable, as they open an easy com-

munication with Egypt, Ethiopia, India, and Persia. *Aden* is the only good seaport in Arabia Felix, being the only one within the Streights that can be quitted at all seasons; but the trade of it was removed to *Mocha* by a king of the country in the 16th century. *Mocha* is situated on a small bay bearing its name, at the very entrance of the Red Sea, and is protected by two forts. Gum arabic, myrrh, and frankincense, brought from the opposite coast of Africa, and coffee, particularly compose the traffic of this place.

The Red Sea was the great channel of commercial intercourse between Asia and Europe, before the Cape of Good Hope had been doubled; it was, previously to that event, the centre of a prodigious traffic, which, although since much decreased, is still very considerable. Europe receives by this route a great deal of Indian and Chinese merchandises. Calicoes, rich silken stuffs, spices, drugs, diamonds, and vast quantities of pearls are conveyed to Aleppo, whence they are exported to England, France, Holland, &c. and also to Trebisonde upon the Black Sea, and to Constantinople. The land commerce of Asia is principally engrossed by the Armenians, an industrious and honest people, who pass their commodities into Turkey in Europe, and Russia, by the Black, and Caspian, Seas. The commerce, which is carried on by way of the Cape of Good Hope, includes all the countries from the Gulf of *Mocha* to China, and all the islands from Madagascar to the Philippines. The commerce of Asia is mostly confined to the coasts of that continent, whither the merchants from the interior bring their merchandises for the purposes of traffic. The commerce of the coasts which is carried on between Asia and Europe and the Indian nations is very extensive, and may be classed under the following heads:

1. The commerce of *Aden* and *Mocha*, which the Turks carry on by the Streights of Babelmandel, and along the Red Sea as far as Suez, whence their coffee and other merchandises are conveyed to Egypt, and thence by sea or land to Constantinople, Aleppo, Smyrna, and other places.

2. The commerce of the Arabians and Persians, through the Persian Gulf to Basora, by which they furnish the great caravans with all sorts of Persian and Indian commodities, which are afterwards transported by the Euphrates and the Tigris to Bagdad, and thence on camels through the desert to Aleppo and Trebisonde.

3. The commerce with the European and Indian merchants jointly, upon the southern coasts of India, namely, upon the coasts of Guzerat and Malabar; and the commerce with the European nations upon the other coasts of India, namely, upon those of Coromandel, Golconda, and Bengal.

The English now almost exclusively engross this portion of the trade of Mocha.

Accounts are kept here in piastres of 80 caivers, or carats.

Persia lies to the north-east of Arabia, being, as has been observed, separated from it by the Persian Gulf, and to the north is bounded by the Caspian Sea. Prolific as this country is in natural productions, and celebrated as it is in history, after what has been already advanced, little remains to be noticed respecting it, which comes within the scope of a work of this kind. On the canal, formed by the junction of the rivers Euphrates and Tigris, at the northern extremity of the Persian Gulph (on the Arabian side), stands the city of *Bassora*, the great depôt of commodities both of import and export connected with Persia. Here reside merchants from various nations, who form the medium of commerce and communication with all the different parts of the world. Through them the linens, stuffs, silks, muslins, rice, spices, indigo, steel, and other European commodities, in general come from the different coasts of India, and are introduced into Persia; and through them are exported the camels, horses, and fruits of this country, with the pearls, for the fishery, of which the shores of the great Gulf, and the mouths of the rivers connected with it, are celebrated.

We now enter upon the last division of this continent which it is proposed to notice in this place, viz. *Turkey*; for those more northern provinces, which form part of the Russian dominions, will be more usefully and intelligibly comprehended under the description and considerations belonging to that empire, which, though extending far into the northern regions of Asia, is more correctly reckoned among the European powers, as well from the situation of her capital, as from the preponderancy of power, and wealth, and influence, which centres there.

Turkey in Asia is divided into eastern and western. The former contiguous to the countries of which we have been treating, and comprehending the provinces of Diarbec, Turcomania, and Georgia: the latter stretching north-westerly, and comprising Syria, Palestine, and Anatolia, commonly called the Levant. The seas which border on it are the Euxine, or Black Sea; the Bosphorus, or sea of Constantinople; the Propontis, or sea of Marmora; the Hellespont; and the Ægean Sea, or Archipelago, which divide Asia from Europe; the Levant, or White Sea, and the Persian Gulph. Its mountains are among the most famous of the world, Olympus, Ida, Mount Ararat, where the ark is said to have rested, Mounts Hermon and Lebanon. Its rivers too are the Euphrates, the Tigris, the Meander, Jordan, and others celebrated in history profane, and sacred. Turkey depends on no

other countries for its subsistence, producing within itself every thing necessary both for use and enjoyment. The corn, maize, and rice, are all of superior quality; the wine and oil, though deprived of half their excellence by the want of skill and diligence in preparation, are sufficient not only for the demands of an extensive consumption, but for the supply of several foreign markets. The silk, cotton, wool, flax, drugs, coffee, sugar, wax, honey, fruits, hides, tobacco, and other commodities, are distributed over the continents of either hemisphere. The capital, Constantinople, is situated upon the neck of land which divides the continents of Europe and Asia, and on that very account is the termination of the subject which employs our present enquiry. It stands in the most unproductive part of the empire, and is supplied from the surrounding coasts with what it stands in need of. The satins and silk stuffs, the velvets of Bursa and Aleppo, the serges of Angora, the crapes and gauzes of Salonica, the carpets of Smyrna, and the silk, the linen, and the cotton stuffs of its other dependencies, proclaim its superiority. Notwithstanding this variety of produce, however, it imports from many European nations, through the Levant, a great quantity of merchandize, especially from the English, French, and Dutch. The principal articles are woollen cloths of excessive fine texture without any nap, and of the most vivid colours. Silk stuffs are also imported from France and Italy, as well as papers of all sorts, principally from the same countries; tin, brass, and other metals from the north of Europe; sugar, spices, camphor, lead, quicksilver, cochineal, dye-woods, &c. from Great Britain. The fur trade is a considerable one, but entirely carried on by the Greeks directly or indirectly with Russia, through Smyrna.

Smyrna is the principal place in the Levant, and has a large and commodious harbour. Through this place all the principal part of the trade with the whole western side of the continent of Asia is executed. More than 15,000 Armenians are established in this city, and the caravans from Persia are composed of them. These caravans arrive and depart at fixed periods, by which the Europeans regulate their shipping, in order that the Asiatics may carry with them the western merchandize, and the Europeans reload with that of Asia. The greatest number of British ships trade with Smyrna, and are held in the highest esteem. Leghorn and Marseilles are the ports of Italy and France respectively, from which the trade, which is not carried on in British bottoms, chiefly comes to the port of Smyrna. The principal exports from the Greek provinces are honey and oil, and cloth, under the appellation of English, though it is inferior and brought from all parts of Eu-

rope, is in great demand. Accounts are kept all through western Asia in aspars and piastrs.

The Islands of Asia alone remain to be considered. They are extremely numerous, but not all of them sufficiently interesting to commerce to be described individually. Those which constitute the empire of Japan, as well as that of Bombay, because it composed a constituent portion of the territory of the English East India Company, have been already brought under review.

The Marian or Ladrone Islands are numerous, but most of them small and unimportant. They were discovered by the Spaniards in 1521, and obtained the name of the Marian Islands in compliment to Marianne the wife of Philip XIV., and then queen of Spain. They have no anchorage for ships, and are therefore seldom visited. Cattle and fruit, especially the rhyma or bread fruit tree, abound.

The Philippine Islands were discovered by the same navigator, Magellan, at the same period as the Ladrone, and obtained their appellation from a like design of complimenting the monarch. The principal of these is Manila or Luconia, rendered famous by the siege it maintained against the English in 1762, though ultimately surrendered. These islands abound in horses, sheep, civet cats, and numerous wild beasts valuable for their skins, beside rice and other vegetables.

The Sunda Islands consist of Borneo, Java, and Sumatra.

Borneo is one of the largest of Asia, and produces great profusion of several commodities, among which are to be reckoned rice, frankincense, musk, aloes, pepper, cinnamon, gums, wax, cassia, honey, cotton, and camphire. It has excellent timber, cotton trees, and canes. There are also diamonds and gold dust. There are most Asiatic animals to be found here, from the elephant to the monkey. There are many Chinese merchants resident here, and no inconsiderable trade is carried on by the English, Dutch, and Portuguese, who import glass, woollen cloths, and iron.

Java, the most distinguished city of which, as indeed it is one of the most important of all the European settlements in Asia, is Batavia. This opulent place is situated on a fine bay of the sea, and has a port in which a thousand ships may ride at anchor; it is divided into two parts by a river, is of a square form, has four handsome gates, being encompassed with a strong rampart, fortified with bastions, and planted with cannon. The country abounds in rice, pepper, coffee, cotton, sugar-canes, and indigo. The Dutch get diamonds and gold from Borneo in exchange for some of the commodities before enumerated, and transmit the whole produce of both islands to Europe in prodigious quantities. Indeed it is the great depôt and

mart of all the produce of India, in which the Dutch traffic with the rest of the world. The climate however is unhealthy.

Accounts are kept in rixdollars, each rix-dollar consisting of 60 light stivers.

Sumatra, the last in the enumeration of these islands and the most considerable, is about 900 miles in length, and near 150 in breadth. It abounds in elephants, tigers, bears, buffaloes, and many tame animals. Rice is the only *grain* that grows in the island, but they have sugar-canes, indigo, pepper, coffee, cotton, cassia, and camphire, with many species of woods, especially ebony, iron-wood, teak, and sandal. Gold, tin, and copper, sulphur, arsenic, and salt-petre, are also found. Bees' wax is an article of great abundance and of equal importance here. Bencoolen, one of the principal towns of the island, is the great English factory, as Palambang is of the Dutch. Acheen is the capital of the island, and the native inhabitants are principally Mahometans; but merchants of almost all countries of the world are resident among them, English, Dutch, Danish, Portuguese, Chinese, &c.

The Moluccas, commonly known by the name of the Spice Islands. These islands are numerous but small, and it is scarcely necessary to observe further than what is imported by their names, that their chief produce is spice of different kinds. This was known to the Europeans before the passage to the East Indies by the Cape of Good Hope had been discovered; and spices were brought from them by the way of the Red Sea to the Mediterranean. They were in the possession of the Portuguese, but are now in that of the Dutch. The nutmeg resembles a peach tree, as the clove does a laurel, but the leaves are smaller. Mace is produced from the former, it being only the husk of which the nutmeg is the kernel. The cloves grow in clusters, and are the blossoms of the tree, which are dried, and prepared to be, what we use under that denomination.

Ceylon is a large island bordering upon the southern extremity of the Coromandel coast, pleasant and fruitful. It produces all the fruits known on the continent of Asia, or in the islands; but is particularly celebrated for its cinnamon. The English have long had large settlements here, and we now hold a sort of disputed sovereignty, having deposed the king of Candy, the native monarch. Elephants are numerous here, and the ivory is thought superior in its whiteness, and the retention of it, under all circumstances, than in any other country. That rare plant, cardamom, as also the betel, is plentiful here. The country is said to abound with mines of gold, silver, and other metals, but those of iron alone have been commonly worked, the others having been monopolized by the former sovereigns of the island.

The Maldives are a cluster of small islands south-west of Ceylon. Their exports consist of cowrie-shells, dried fish, cordage, and sails made of the fibres of the cocoa, and a particularly beautiful kind of the tortoise-shell. They import iron, steel, spices, rice, and some few other commodities from China. Cowries are their usual medium of barter, except so far as they exchange one commodity for another.

Socatra, or *Socatora*, is the last island to be noticed under the article of Asia; it lies at the western extremity of the Arabian sea, at the mouth of the Straits of Babelmandel, is 24 leagues in length and 16 in breadth, remarkable for fine aloes, frankincense, ambergris, and dragons' blood.

ASLANI, or **ASSELANI**, is the Dutch dollar or piastre, which is current in all the ports of the Levant. There are two sorts of *Aslani*, that of Holland, and that which is struck at Inspruck in the Tyrol. The latter is esteemed superior in point of fineness to that of Holland. The value of the *Aslani* is generally about four shillings sterling.

ASP, or **ASPER**, a tree of the poplar kind, one of, what are called, the *white woods*, soft and light, and used chiefly in the manufacture of articles called Tunbridge ware; and as such, a valuable item in commerce of small ornamental matters for the use of the ladies.

ASPARAGUS, vulgarly known by the name of sparrow-grass, an esculent plant, the heads of which are useful for the table and the roots in medicine. It was known in both capacities to the Greeks, and has maintained its celebrity ever since in most countries. It is used medicinally to cleanse the viscera, to carry off jaundice and dropsies, and other complaints arising from obstructions. It grows best in rich unctuous earth, generally called loam, and makes a great article of consumption for the London markets in the spring months. It was formerly an item of considerable external commerce, but its roots, as a medicine, having been superseded by more powerful, or more fashionable, ingredients, it is now principally confined to the table, and its consumption to the markets of the metropolis.

ASPEE, a corn measure in Lyonnois and Maconois, in France; at Lyons it is expressed for a certain quantity of wine, which is an ass's load.

ASPER, or **ASPRE**, an imaginary money of Turkey, equivalent to eight shillings and five-pence.

ASPHALTOS, or **BITUMEN JUDIACUM**, *Jews' pitch*, is a solid, brittle, ponderous substance, of a red, blackish, or dark colour, easily inflammable, and of a strong bituminous smell. The best comes from Judæa, where it is gathered on the Dead Sea. At first it is so soft, viscid, and glutinous, that it cannot, without difficulty,

be separated from any part which it touches, but in time it grows harder than pitch. It is used among the Egyptians, in embalming and preserving dead bodies. It is of a discutient, emollient, and agglutinating quality. It dissolves coagulated blood, and promotes the menstrual discharge. It is an ingredient in the Venice treacle, and in the embalming powder of Charas.

ASPHALTUM, a bituminous stone, found generally near the ancient Babylon, and used in the composition of cement, for joining stone or brick-work under water, being impenetrable by that fluid. A mine of this was found long since, in the mountain called Val-Travers, in Neufchatel, Switzerland. Its qualities are, 1st, it makes an excellent cement, which neither the air can corrupt, nor water penetrate; 2d, with the oil of it, which it is easy to extract, is made a sort of pitch, famous for caulking ships and vessels; 3d, its oil is said to be a cure for several cutaneous diseases; 4th, it makes a perfume, by sprinkling it on live coals: excellent for the cure of rheumatic pains, and for purifying stables, &c. from bad air, occasioned by the distempers of cattle. Several experiments have been made of this, which saved the lives of many cattle during a contagious distemper, that had begun to rage in France.

ASPIC is an oil drawn from a plant, which C. Bauhine calls *lavendula latifolia*, but to which J. Bauhine gives the name of *pseudo-nardus*, and the French that of *aspic*. This plant is found in all parts of Provence. The flowers of it, when almost dry, are put into a large still, with a great deal of water. After a maceration for some days, the whole is distilled, upon which there comes off along with the water an oil of a yellowish or amber colour; and this is the oil of *aspic*, pure and unadulterated. The flowers contain a large quantity of essential oil, and are to be chosen for this purpose, in preference to any other part of the plant. *Mem. de l'Acad.* 1715.

The oil of *aspic* is used by painters in the mixing of colours, also by farriers, and other artificers; it is likewise of use in medicine. It is very inflammable, and when once on fire, it is almost impossible to extinguish it.

ASPORTATION is a legal term for the removal of any chattel stolen. Although there may have been an actual furtive seizure, unless there be also some removal of the article seized from the situation where it was placed, the offence, called larceny, is not complete by the law of England. But it is not necessary to constitute this offence that there should be an actual carrying away, for any removal from the place of deposit, however small, is an asportation in law. 4 *Black. Com.* 231.

ASS, a quadruped of the horse kind, which copulating with a mare, produces one of

the most useful beasts of burthen, the mule. The Ass is said to be originally a native of Arabia, and its size and spirit degenerate as it advances into the colder regions, which accounts for the race being so diminutive, as well as proverbially dull, in this kingdom. They are more cherished in Spain than in any other European country, where they are chiefly used for the purpose of propagating mules; but the exportation of either is wholly prohibited. A few, which have been occasionally brought over by stealth, are sufficient to shew the great advantage which would accrue from their introduction.

ASSA-FETIDA, (GER. *Teufelsdrück*. Du. *Duivelsdrck*. Da. *Dyvelsdræck*. Sw. *Dyffelstrück*. Fr. It. & Port. *Assa-fetida*. Sp. *Asa-fetida*. Pol. *Smrodzeniec*. Lat. *Asa-fetida*.) the concrete juice of the root of the *hingisêh*, or the *assa-fetida* plant. *Kæmpf. Amœnit. Exot.* It is brought in large masses from Persia and the East Indies. It is a compact, gummy, resinous substance, soft and pliable like wax while new, composed of various little shining lumps or grains, which are partly of a whitish colour, partly reddish, and partly of a violet hue. It smells like garlic, but much stronger, and has a bitter, acrid, biting taste. Those masses are best which are clear, of a palish red, and variegated with a great number of elegant white tears. When it first exudes from the wounded root, it is liquid and white, like milk; but upon being exposed to the air, it becomes of a brownish colour, and gradually acquires different degrees of consistency. See further, title GUM.

ASSARON, or OMER, a measure of capacity, in use among the Hebrews, containing five pints. It was the measure of manna, which God appointed for every Israelite.

ASSAULT is, in law, a blow, or an attempt to give a blow, to the person of another. Assault does not necessarily imply an actual striking, nor is it material that the offence be committed in any particular manner, as with a hand, or a foot; for to spit at a man, or to throw dirt at him, or even to hold up a fist in a threatening manner, or to level a gun at another, is an assault. 3 *Black. Com.* 121.

Assaulting persons with an offensive weapon, with intent to rob, although no robbery be committed, is punishable with transportation for seven years. 7 *Geo. 2. c. 21.*

Assaulting in the highway, with intent to spoil the wearing apparel of any person, is felony, and subject to transportation. 6 *Geo. 1. c. 23.*

And assaulting a privy counsellor in the execution of his office, is felony without benefit of clergy. 9 *Ann. c. 16.*

ASSAY. This term, in chemistry, in a general sense, implies the analysis, or examination, of a sample of any substance,

whose chemical composition is to be ascertained; but the term is also technically restricted to the analysis of gold and silver mixtures, with the express purpose of determining the proportion of these metals to that with which they are alloyed, in any individual mass. In this application of the term, the business of the assayer becomes of great importance; for few operations in chemistry require so nice and minute attention, and such practical experience, as one which, from the sample of a few grains, is to decide the standard of large masses of the most valuable metals.

The assaying of gold or silver is divided into two operations; by the first they are separated from the other metals, or those easily oxydized, which we shall, for the sake of convenience, term *imperfect* metals; but when speaking of metals expressly, we shall adopt the more scientific mode of designating them, which is now generally followed; by the second process they are parted from the metals which resist oxydation by simple exposure to the air, and which have hitherto been generally called the *perfect* metals. This process generally consists in separating gold and silver from each other, as the third perfect metal, platinum, is but seldom found united to them.

The principle of the method of separating gold or silver from the imperfect metals, is founded on the facility with which the latter imbibe oxygen; and the process is calculated to facilitate this process as much as possible; hence the oxyde of lead, or litharge, is generally considered as the most powerful purifier of the perfect metals, from the ease with which it parts with its oxygen to the imperfect metals united with them. Oxyde of manganese has of late been employed for the same purpose. In chemical analyses of metals, the oxyde of lead is generally preferred; but in the assays performed by authority, metallic lead is always used, probably from the ease it is supposed to afford in determining the weight of the different ingredients by calculation. The lead in the process first becomes oxydized, then yields some of its oxygen to the other imperfect metals, afterwards becomes vitrified in conjunction with them, and carries them off by sublimation, leaving the gold or silver behind in the vessel, called a cupel, in which the operation is performed. This forms the process termed *cupellation*.

Cupels are cakes of earth with a little depression on the upper surface, made with bone ashes, finely powdered, and formed into a paste with water, and thoroughly dried. The cores of ox-horns are preferred at the Tower Assay-office. The cupel is placed in a vessel called a muffle, which is an earthen pot of an oven-form, vaulted at top, open at one end, and close every where else except a few narrow slits, to afford a passage for air. The open end comes in

contact with a door at the side of a furnace, to which it is luted. This protects the cupels from the contact of the fuel. The body of the muffle is surrounded with burning coals; and, before cupellation, is gradually heated to a glowing redness: a little powdered chalk, or sand, is sprinkled on the floor of the muffle, to prevent the adhesion of the cupels by the litharge soaking through them; they are then ready to receive the metal to be cupelled. Cupels should be of a size proportionate to the quantity of lead that may be necessary to be used, as they cannot absorb a weight of litharge more than equal to their own.

The assay of silver is performed on a piece of metal, not weighing more than thirty-six grains, and less if the alloy appears to be considerable: this is accurately weighed, laminated, and then wrapped up in the requisite quantity of lead, rolled out into a sheet. The lead employed should be revived from litharge, as native lead sometimes contains a portion of silver, which would prevent accuracy of calculation in the product.

The silver and the lead are put on the cupel, when it and the muffle are red hot. They immediately melt, and the mass gives out dense fumes, which consist of lead in vapour; and a stream of red matter flows from the top of the globule down its sides, carrying with it the copper or other alloy of the silver into the cupel. As the cupellation advances, the melted button becomes rounder, its surface becomes streaky, nitid, opake, and then white and brilliant, and at length perfectly pure. The cupel is then allowed to cool gradually, till the globule of silver is fixed, when it is taken out while still hot, and when cold accurately weighed. If the globule be cooled too quickly, the outward surface contracts so suddenly, as to force out the fluid metal at the centre in arborescent shoots, by which some portion is lost, and the assay spoiled.

In the delicate assays for the Mint, two assays are always made of the same mass of metal; and no sensible difference between the weights of the buttons is allowed to pass in scales that turn with the $\frac{1}{1200}$ part of a grain troy.

In the common assays of plate, either gold or silver, copper is the alloy usually met with: if the fine metal be nearly pure, the cupel round the bottom is only stained yellow by the litharge; if copper is contained, it leaves a brown stain. The other metals, except bismuth, scarcely penetrate the substance of the cupel, but remain on the edges of its cavity, in form of coloured scoriæ, of which iron is black, tin grey, and zinc a dull yellow.

As the cupellation requires a free access of air as well as an high degree of heat, the stopper of the muffle is always removed as

soon as the metal is put into the hot cupel; but to prevent the current of air from cooling the metal too fast, several pieces of charcoal are heaped up in front of the muffle, which burn with sufficient force to heat the air as it passes to the cupels. The furnace should be made so that the heat of the fuel within may be readily increased or diminished, but, at the same time, so that it can be kept up with steadiness. If the heat be too great, the silver would become in part volatilized: the heat is known to be such when the cupel can scarcely be distinguished from the muffle, and the ascending fume can scarcely be seen for the dazzling heat.

The time required in making this assay is generally from 15 to 25 minutes. The proportioning of the lead to the supposed alloy in the silver to be assayed, is of great importance: if too little be employed, some of the alloy will remain in the mass; but if too much is used, some of the silver will be wasted, as the lead carries a small proportion of the silver down with it into the cupel. Bismuth will serve the same purposes as lead in cupellation; but it is clearer, and carries more of the silver with it into the cupel.

To estimate the quantity of alloy in silver, assayers formerly used what were called *touch-needles*, or small slips of silver, alloyed with known proportions of copper, in a regularly increasing series, from the least to the greatest proportion ever used. The silver to be assayed was compared with these, and its alloy estimated by that of the needle to which it shewed the closest resemblance. But an experienced assayer is now able to judge of the alloy with sufficient exactness by the ease or difficulty with which the silver is cut, by the colour and grain of a fresh-cut surface, the malleability, the change of surface when made red-hot, and the general appearance.

The assay of gold is more complicated than that of silver. The baser metals may be separated from it by cupellation, in the same manner as from silver, except copper, which has so strong an affinity for gold, that it can scarcely be overcome by this method, unless silver is first combined with the mass; and this makes the second operation before mentioned necessary, that of parting the gold from the silver.

The process of parting is performed by *aqua-fortis*, which dissolves the silver, and leaves the gold untouched. But in this operation it is found, that when the gold exceeds a certain proportion in the mixture, it so much protects the silver from the acid, as more or less to prevent its action. Therefore, when the gold is in excess, it becomes necessary to add so much silver as to give this metal the predominance. The proportion of silver generally used is three parts to one of the gold, whence the process receives the name of quartation. Several

good assayers think two parts are sufficient.

Though copper as well as silver is present, the parting may be proceeded to, as this metal is likewise soluble in aqua-fortis; yet it is found to have some advantages to cupel the mixture first with lead; and likewise even when no copper is combined with the gold.

The cupellation of gold is thus conducted: the portion of the alloy of silver being estimated by touch-needles, as much silver is added as will make the entire quantity of this metal about thrice the weight of pure gold.

The proportion of lead to the alloy of copper, or other base metal, is nearly the same as for silver. The heat necessary in the process is greater than for silver, and may be used with freedom, as none of the gold is lost by volatilization. The button is cooled, taken out and weighed, then hammered flat and annealed, and afterwards laminated between steel rollers to a plate about the thickness of a wafer, again heated to redness, and then coiled up into a spiral roll. The button of gold, when it lightens, still retains a minute portion of lead: this may be got rid of by its being kept a little time in fusion in a clean vessel. The lead entirely disappears after parting.

The spiral roll is called a cornet, and, when prepared, is put into a glass matrass, shaped like a pear, in order to separate the silver from it, and about thrice its weight of pure nitric acid poured upon it, moderately diluted (so as to be about 1.25 specific gravity). The glass is set on a sand bath, or over charcoal, to boil. When warm, the acid dissolves the silver: as long as it continues to act, the cornet is studded with minute bubbles; when these discontinue, or are united in one large one, it is a sign that the acid has ceased to operate. About twenty minutes are required for this process.

The cornet is now corroded throughout, having lost its silver: it retains the same form, but is very slender and brittle. It is of importance to the accuracy of the assay, that it should not be broken. The hot acid solution of silver is then poured off with great care, and fresh acid, rather stronger, is added, to clear away all the remains of the silver, and boiled as before, but only for five or six minutes. It is then decanted, and added to the first solution, and the parting glass is filled with hot distilled water, to wash all remains of the solution. A small crucible is to be inverted over the glass while it is full of water; the latter is then nimbly turned, and the cornet falls gently into the crucible through the water, which being poured off, the crucible is heated to redness under a muffle, when the cornet shrinks extremely in every direction, becomes firm, and when cooled regains its metallic lustre, and is soft and

flexible. It is then accurately weighed; and the process is finished.

The final weight of the gold cornet indicates the absolute quantity of this metal in the assayed sample. The difference between the weight of the button after cupellation (deducting the silver added) and the first sample, is the weight of the copper, or other base metal in the gold; and the difference between the gold cornet, together with the silver added, and the button after cupellation, is the quantity of silver with which the gold was alloyed.

The silver is usually recovered from the solution after parting, by immersing in it plates of bright copper, which dissolve and precipitate the silver in the metallic form.

Touch-needles for gold are formed in the same manner as for silver; but more of them are required, as the various combinations of three metals are to be examined by them in this case. In trials with these needles, nitric acid is of singular service: a drop of it is let fall on a streak of metal on the touchstone, which may be a bit of black basalt, or black pottery; in eight or ten seconds it is washed off, and the effect observed. If the streak preserve its golden brilliance unaltered, the metal is judged to be of a certain degree of fineness; if it look red, dull, and coppery, it is less fine; if the streak be nearly almost entirely effaced, it contains very little gold.

A peculiar set of weights are used for assaying. In this country the quantity of metal taken for assay is very small; generally from 18 to 36 grains troy for silver, and from 6 to 12 grains for gold. This is the integer; and whatever be its real weight, it is denominated the assay pound. This imaginary pound is then subdivided into aliquot parts, but differing according to the metal. The silver assay pound is subdivided, as the real troy pound, into 12 ounces, each ounce into twenty pennyweights, and, for assaying, these again into halves.

It remains for us to give the proportions of lead to the estimated alloy of fine metal necessary to be added for cupellation.

Copper, when taken singly, is found to require from ten to fourteen times its weight of lead for complete scorification on the cupel. Now all admixtures of fine metal tend to protect the copper from the action of the lead, and the more powerfully the greater proportion of fine metal. The following table is a table of the proportions of lead required to different alloys of copper. In the three first columns is shewn the absolute increase of the quantity of lead in alloys of decreasing fineness. In the three last columns will be seen the gradual diminution of the protecting power of fine metal against scorification, in proportion to the increase of alloy, shown by the decreasing quantity of lead required for the same weight of copper, under different mixtures:

Silver.	Copper.	Lead.	Ratio of Inc.	Copper.	Silver.	Lead.
25 with 1 requires	96 =	4 × 24	and hence	1 with 25 requires	96	
22 2	144 =	6 × 24		1 11	72	
20 4	192 =	8 × 24		1 5	48	
18 6	240 =	10 × 24		1 5	40	
16 8	288 =	12 × 24		1 2	36	
14 10	336 =	14 × 24		1 1 $\frac{2}{3}$	33	
12 12	384 =	16 × 24		1 1	32	
10 14	432 =	18 × 24		1 $\frac{5}{7}$	30	
8 16	480 =	20 × 24		1 $\frac{1}{2}$	30	
6 18	528 =	22 × 24		1 $\frac{1}{3}$	29	
4 20	576 =	24 × 24		1 $\frac{1}{4}$	28	
2 22	624 =	26 × 24		1 $\frac{1}{5}$	28	

The proportions of lead for gold assay-
ing are nearly the same as for silver.

Assays of alloys with platina are conducted nearly in the same manner as for the mixtures of silver and gold. Silver is seldom alloyed with it, but gold more frequently; and is known by the much greater heat it requires in the fusion; by the edges of the button appearing thicker and rounder than in common assays of gold; by its being duller, and tending to yellow; and its being entirely crystallized on its surface.

The action of nitric acid on the alloys of platina is very remarkable. By itself, platina is as insoluble in this acid as gold, and a mixture of these two metals equally resists its action; but when silver enters into the mixture in the proportion of $2\frac{1}{2}$, or three times, the weight of the gold and platina, and when the platina is not above a tenth of the gold, the platina is totally soluble in nitric acid, together with the silver, and the gold alone remains untouched.

When the gold, mixed with platina, is to be freed from it in the above manner, it must be laminated very thin; a weak acid is first added, and boiled for some time. If the platina be above two per cent. of the gold, the acid assumes a straw colour, which deepens in proportion to the greater proportion of the platina, and at the same time the cornets assume a brownish green. A stronger acid is then added, and boiled three times successively, to detach the last portions of platina, which are separated with difficulty. Parting might be used even when the platina is more than a tenth of the gold; but then more silver must be added, which would render the cornet so very thin after the action of the acid, that it could hardly be annealed without breaking.

When alloys of silver alone with platina are treated with nitric acid, the silver dissolves as usual, but the liquor soon becomes muddy with a very fine bulky black precipitate, which continues increasing till all the silver is dissolved, and which is found to be entirely platina. A part of the platina, however, remains in the solution; for on adding muriatic acid to the liquor separated from the precipitate, white luna cornea falls down, after which carbonate of potash will throw down a green coagulum, which is

oxyde of platina. The above effects of nitric acid will therefore detect an alloy of silver and platina.

According to the laws of England, all sorts of wrought plate, in general, ought to be made according to the standards of gold and silver; and the current prices of such standard gold and silver is the common rule whereby to value bullion, whether in mass, bars, dust, or in foreign coin: but the true value of bullion gold or silver cannot be known without being assayed; for the use of an assay, as we before observed, is to discover how much alloy there is in any bullion. If there be less alloy in it than in the standard, so much finer and more valuable is it than standard. If, on the other hand, there be more alloy than in the standard, such bullion will be coarse, and consequently so much less valuable than standard.

To get bullion assayed, you take a slip of paper and put into it a few grains (the usual quantity) cut off the bullion which is to be assayed, fold it up, and underneath write the owner's name.

This paper is carried to his majesty's assay-office, in the Tower, or to the company's office in Goldsmith's hall. After the same is assayed, if you ask for it in the owner's name, it will be returned to you again, with the gold or silver in it: for which you pay the customary fee.

When you come to open the paper, you will find the assay-master's name, and report written by him, much after the following form, viz.

A — B —

Silver for an assay, January 8th, 1818.

W. 12 dwts. ob.

A — B —

Gold for an assay, January 10th, 1818.

B. 2 gra. $\frac{3}{4}$.

The assay-master makes his reports of silver in ounces, pennyweights, and half pennyweights; and of gold in carats, carat-grains, and the fractions of a carat-grain. It must be observed, also, that B stands for better than standard; W for worse; Ob. for half pennyweight; Sta. for standard.

ASSAYING of weights and measures, is the examination of weights and measures by the clerk of the market.

ASSAYER of the king, an officer of the

king's mint for the trial of silver: he is indifferently appointed between the master of the mint and the merchants that bring silver for exchange. 2 Hen. 6. c. 12. Vessels of gold shall be assayed. 28 Edw. 1. c. 20. and 13 Car. 2. c. 5.

ASSAYERS of plate made by goldsmiths, &c. These are for assaying and marking thereof; of whom, with their fees, and how the assay offices are regulated by statute, see 12 Geo. 2. c. 26., and article GOLD-SMITHS.

ASSEMBLY, unlawful. A succession of statutes have been enacted since the 36 of Geo. 3. for the protection of the person of the sovereign, and for the prevention of seditious meetings and unlawful assemblies. The last and most comprehensive of these is 57 Geo. 3. c. 19. It enacts that no meeting of more than 50 persons (except county meetings called by the lord lieutenant, sheriff, &c.) shall be holden for preparing any petition, &c. or other address to the king, regent, or houses of parliament, upon pretence of deliberating upon any grievance in church or state, unless notice of such meeting, &c. shall be given by seven house-keepers, five days before, in some public newspaper, &c. signed by them, &c. on pain of forfeiting 50*l.* by the person who inserts the same without such authority. And all persons assembling contrary to the provisions of this statute, or refusing to disperse after proclamation made for that purpose by any justice, magistrate, sheriff, or under-sheriff, in their respective jurisdictions, but remaining to the number of 12 or more persons by the space of an hour after such proclamation, shall be guilty of felony without benefit of clergy. And persons obstructing justices, &c. in the execution of their duty, shall be punished in like manner.

And all places wherein lectures shall be given, or debates holden, for admission to which money shall be taken, &c. shall be considered unlawful, unless previously licensed; and the persons opening the same shall be liable to a penalty of 100*l.*, and the persons who shall conduct the proceedings there to a penalty of 20*l.* And justices may demand admittance to all such assemblies, and a refusal to admit them shall subject the parties refusing to a penalty of 20*l.* Places licensed shall forfeit their licences in case of any seditious or immoral lectures, &c. being given. And all persons taking unlawful oaths, &c., or electing delegates or committees for seditious purposes, shall be proceeded against according to 39 Geo. 3. c. 79. Freemasons' lodges, meetings for charitable purposes, Quakers' meetings, &c. are exempted from the penalties of the statute. Penalties above 20*l.* are to be recovered by action; those not exceeding, by summary conviction before justices of the peace.

ASSESSED TAXES, certain direct imposts, so denominated in contradistinction

to the indirect taxes on consumable articles. They are imposed by divers statutes on the following items: 1. Windows. 2. Houses. 3. Servants. 4. Carriages. 5. Horses kept for pleasure. 6. Other horses and mules. 7. Dogs. 8. Horse dealers. 9. Hair powder. 10. Armorial bearings. 11. Game certificates. These taxes are made payable by quarterly instalments; viz. on the 20th day of June, for the quarter commencing from the 5th day of the preceding April, and ending on the 5th day of July; the 20th day of September for the quarter commencing from the 5th of July and ending on the 10th of October; the 20th day of December for the quarter commencing from the 10th day of October and ending the 5th of January; and the 20th day of March for the quarter commencing from the 5th day of January and ending on the 5th day of April next. These duties, in the event of non-payment, are to be levied by distress and sale.

ASSETS, in law, goods or property in the hands of a person, with which he is enabled to discharge an obligation imposed upon him as executor, &c. Assets may be real, or personal. Lands, in general, are *real*; personal estate, or goods which come to the executor, are *personal*.

ASSIGN, is to appoint, or transfer, or set over, a right to another. He that *assigns* is called the *assignor*, and he to whom the thing is *assigned* is named the *assignee*.

ASSIGNEE, in law, a person appointed by another to do and act, transact some business, or enjoy a particular commodity.

Assignees may be by deed, or by law: by deed, where the lessee of a farm assigns the same to another; by law, where the law makes an assignee, without any appointment of the person intitled, as an executor is assignee in law to the testator, and an administrator to an intestate. It is most commonly applied to those creditors of a bankrupt who are appointed by the rest to manage for them, and consequently have the bankrupt's estate assigned over to them. See **BANKRUPT**.

ASSIGNMENT, in law, differs from a lease in this; that by a lease a man grants an interest less than his own: in assignment he grants the whole property. 2 *Black*. 326.

ASSIZE, is a word of extensive interpretation and diversified application; so diversified indeed, that, for particular information, the reader must inevitably be referred to more voluminous works. It signifies a sitting of judges *assigned* by the king's commission to travel through all the counties of the kingdom, in order to hear suits and to try offenders. This assize is of so early a date as the reign of King Henry II., and was, even then, rather the adoption of an anterior practice with certain alterations, than a new ordinance.

The word is also both legally and colloquially used for any law which regulates

the weight or size of any commodity; and sometimes also for the quantity itself which is prescribed. Thus the statutes which have been occasionally passed respecting the weight of bread are called the *assize of bread*; and the comparative proportion which is to be kept up between the price of wheat and that of bread, is also called the *assize*.

The statutes relative to the assize of bread are extremely numerous, but the most recent and comprehensive is 53 Geo. 3. c. 116. See the numerous tables, and decided cases on it, *Dick. Pract. Expos.* v. 5. p. 74.

By 55 Geo. 3. c. 99. the city of London, and all places within ten miles thereof, are exempted from the provisions of the statutes for setting the assize of bread; and other provisions are introduced for protecting the public from the frauds of bakers. *Id.* p. 99.

ASSUMPSIT, a voluntary promise, whereby a person assumes, or takes upon himself, to perform or pay any thing to another. All assumpsits must be for some valuable consideration; and they are either *express*, or *implied*. Express is by direct agreement, either by word, or note without seal. Implied: when any person becomes legally indebted to another for goods sold, the law *implies* a promise that he will pay his debt; and if he does not pay it, the writ *indebitatus assumpsit* lies against him; and will lie for goods sold and delivered to a stranger or third person, at the request of the defendant: but the price agreed on must be proved, otherwise that action does not lie.

ASSURANCE. See **INSURANCE**.

ASTERISK, a little star; a succession of these are placed to denote that so many letters in a word are omitted; for which these are substituted. This is generally done in order to avoid a prosecution for libel.

An Asterisk is also frequently used as a mere mark of reference for some passage in a page, to a note at the bottom of the same page.

ASTERN, one vessel sailing after another is said to be astern of her.

ASTRINGENTS are substances distinguished by a rough austere taste, and the power of changing solutions of iron, especially those made in the sulphuric acid, into a dark purple, or black colour. & But the most certain test is that of their forming a copious precipitate with animal jelly. Those used in medicine, and in the arts, are, oak-bark, nut-galls, logwood, walnut fuel, kino, catechu, bistort, sloe, dragons' blood, pomegranate, red roses, and tormentil root.

ATCHABANNIES, a species of Bengal calico.

ATCHE, a small silver coin used in Turkey, and worth only one-third of the English penny.

ATHANOR, in chemistry, a kind of digesting furnace, contrived to keep a constant heat for a considerable time.

ATIBAR, a name for gold-dust, in the

kingdom of Gago in Africa, and from which the Europeans, and particularly the French, have composed the word *tibir*, which also signifies gold-dust.

ATLAS, denotes a book of universal geography, containing maps of all parts of the known world.

ATLAS, in commerce, a sort of silk or satin manufactured in the East Indies, in which gold and silk are so wrought together, as no workman in Europe can imitate. In China they weave long slips of gilt paper into their silks. The same slips of paper are twisted about silk threads, so artificially, as to look finer than gold thread, though of no great value.

ATTACH, (*attachiare*, from the French *attacher*,) signifies to take or apprehend by commandment of a writ or precept. It differs from arrest, in that, he who arresteth a man, carrieth him to a person of higher power to be forthwith disposed of; but he that attacheth keepeth the party attached, and presents him in court at the day assigned.

ATTACHMENT is the process that issues at the discretion of the judges of a court of record against a person for some contempt, for which he is to be committed, and may be awarded by them upon a bare suggestion, or on their own knowledge, without any appeal, indictment, or information.

ATTACHMENT, *Foreign*, is an attachment of money or goods, found within a liberty or city, to satisfy some creditor within such liberty or city. By the custom of London, and several other places, a man can attach money or goods in the hands of a stranger, to satisfy himself. In London the process is taken out for attachment, at the Lord Mayor's Court Office, over the Royal Exchange.

A *Foreign attachment* cannot be had when a suit is depending in any of the courts of Westminster, which make the matter not to be meddled with by any other court. *Cro. Eliz.* 691. And nothing is *attachable* but for certain and due debt; though by the custom of London, money may be attached before due, as a debt; but not levied before due. *Sid.* 327. 1 *Nels. Abr.* 282, 283.

Foreign attachments in London, upon plaint of debt, are made after the following manner: "A. owes B. 500*l.* and C. is indebted to A. 500*l.* B. enters an action against A. of 1000*l.* and by virtue of that action a serjeant *attaches* 500*l.* in the hands of C. as money of A. to the use of B. which is returned upon that action." The *attachment* being made returned by the serjeant, the plaintiff is immediately to fee an attorney, before the next court to be holden; or the defendant may then put in bail to the *attachment*, and nonsuit the plaintiff: four court days must pass before the plaintiff can cause C. the *garnishee*, in whose

hands the money was *attached*, to shew cause why B. should not condemn the 500*l.* *attached* in the hands of C. as the money of A. the defendant, in the action (though not in the *attachment*) to the use of B. the plaintiff: and the garnishee C. may appear in court by his attorney, wage his law, and plead that he has no money in his hands of the defendant's, or other special matter; but the plaintiff may hinder his waging of law, by producing two sufficient citizens to swear that the garnishee had either money or goods in his hands, belonging to A. at the time of the *attachment*, of which affidavit is to be made before the Lord Mayor, and being filed, may be pleaded by way of estoppel: then the plaintiff must put in bail, that if the defendant come within a year and a day into court, and he can discharge himself of the money condemned in court, and that he owed nothing to the plaintiff at the time in the plaint mentioned, the said money shall be forthcoming, &c. if the garnishee fail to appear by his attorney, being warned by the officer to come into court, to show cause as aforesaid, he is taken by default for want of appearing, and judgment given against him, for the goods and money *attached* in his hands, and he is without remedy, either at common law, or in equity; for, if taken in execution, he must pay the money condemned, though he have not one penny, or go to prison; but the garnishee appearing to show cause why the money or goods *attached* in his hands, ought not to be condemned to the use of the plaintiff, having feed an attorney, may plead as aforesaid, that he has no money or goods in his hands of the party's against whom the *attachment* is made, and it will then be traced by a jury, and judgment awarded, &c.; but after trial, bail may be put in, whereby the *attachment* shall be dissolved; but the garnishee, &c. and his security will then be liable to what debt the plaintiff shall make out to be due, upon the action; and an *attachment* is never thoroughly perfected, till there is a bail and satisfaction upon record. *Privileg. Lond. & Com. Dig. title Attachment.*

If a plea of foreign attachment (in London) state the custom, &c. it ought also to *aver* "that the defendant in the plaint was indebted to the plaintiff within the city;" but it is not necessary that the debt should arise within the jurisdiction, or that the defendant in that court should reside within it, or be actually summoned. *Morris v. Ludlam, 2 H. Black. R. 362. Harrington v. Macmorris, 5 Taunt. R. 232.*

A. deposits goods with B. as a security for money advanced by B., with a promise to deliver the bill of lading when it should arrive, indorsed to B.; C. is employed as broker to dispose of the goods for B.'s benefit. Before the bill of lading arrives, the goods are attached in the Mayor's Court, in the hands of C., by a creditor of A.,

held that the transfer of the property to B. was complete, though the bill of lading had never been indorsed, and therefore that the foreign attachment was no answer to an action by B. against C. for the proceeds. *Giles v. Nathan, 1 Marsh. R. 226.*

A garnishee against whom there was a recovery in the Mayor's Court on foreign attachment, after a summons to defendant, and return of *nilhil*, may protect himself by giving such proceedings in evidence, in an action to recover the same debt brought by the defendant below, without proving the debt of the plaintiff below, who attached the money in his hands. *Macdaniel v. Hughes, 3 East. R. 367.*

ATTAINER. When sentence is passed upon a person who has committed treason, or felony, the immediate inseparable consequence is attainder. But this is not till after judgment and sentence pronounced; for there is a material difference between a man merely convicted, and one attainted. After conviction *only*, a person is not subject to the disabilities of attainder, which are forfeiture and corruption of blood; but when judgment has been pronounced, attainder follows of course.

The 54 Geo. 3. c. 145. enacts, that thereafter no attainder, except for treason, or murder, or abetting or counselling the same, shall extend to any person other than the offender, for his natural life only.

ATTORNEY, (*attornatus*), is one set in the place of another man, and who has authority given him to act in the place and stead of him by whom he is delegated, in private contracts and agreements, which authority must be by deed, that it may appear that the attorney has pursued his commission, and this is in general done by a power or letter of attorney executed under seal, though such a power may be and very frequently is contained in other deeds. 1 *Bac. Abr. title Attorney.*

Of this power all persons are capable, and therefore the same may be executed by infants, femes covert, persons attainted, outlawed, excommunicated, aliens, and others; for this being only a *naked authority*, the execution of it can be attended with no manner of prejudice to the persons under such incapacities or disabilities, or to any other person who by law may claim any interest of such disabled persons after their death. *Ibid.*

Attorney at Law is a person duly admitted in the king's courts, and who is appointed by another person, usually denominated his *client*, to prosecute, or defend, some suit on his behalf; and he is considered as a public officer belonging to the courts of justice in which he may have been admitted.

The principal statutes for the regulation of Attornies, are, 3 Jac. 1. c. 7. — 2 Geo. 2. c. 23. — 12 Geo. 2. c. 13. — and 22 Geo. 2. c. 46. By these none can be admitted, as attornies or solicitors, unless they have

served a clerkship of five years, been enrolled, and taken the oath in that case provided; and the Judges of the respective courts are required to examine their several capacities.

A stamped duty is charged upon all articles of clerkship to an attorney or solicitor. Also every attorney, solicitor, notary, procurator, or agent, shall annually take out a certificate, charged with a stamp duty, between the 15th day of November and the 15th day of December. 54 Geo. 3. c. 144.

Attornies may be punished for illegal practices; and if an attorney, or his clerks, of which he must have but two at one time articulated, do any thing against the express rules of the court, he or they may be committed by such court.

Attornies have the privilege to sue and be sued in the courts of Westminster, while they practise, but no longer. *Brook v. Bryant*, 7 Term R. 25.

By 2 Geo. 2. before mentioned, no attorney or solicitor shall commence or maintain an action for the recovery of any fees, charges, or disbursements, until the expiration of one month or more after he shall have delivered to the party charged, or left at his dwelling-house or last place of abode, a bill of such fees, &c. written in a legible hand, in English, and in words at length, &c. &c. N. B. A leaving at the computing-house is not sufficient. 2 Bos. & Pul. 343.

A copy of such bill will be good evidence without notice to produce the original. 2 Bos. & Pul. 237.

But it will also be evidence against any increase of charge, or any addition of items, by a subsequent bill. 1 Bos. & Pul. 49.

A mistake in the date of items which does not mislead, will not vitiate the delivery as to time. 4 Taunt. 806.

Negligence in the conduct of a cause cannot in general be set up as a defence to an action on an attorney's bill. 2 N. Rep. 136.

An attorney has a lien for his general balance on papers of his client which come to his hands in the course of his employment; and acceptances given, and afterwards dishonoured, do not extinguish such lien. 1 M. & S. Rep. 535.

But the lien of an attorney on papers is only commensurate with the right of the party delivering these to him. 4 Taunt. R. 807.

An attorney has a lien for his bill of costs on money levied by the sheriff under an execution, on a judgment recovered by his client. 1 H. Black. R. 122.

And he has a similar lien upon a sum awarded in favour of his client, as well as if recovered by judgment; and he shall not be prejudiced by a collusive arrangement between the parties. 1 East. R. 464.

An attorney coming into possession of records as a deputy to a principal, on the

death or removal of that principal, will be compelled summarily by the court of which he is an attorney, to deliver up such records to a new principal. 2 Black. R. 912. And generally all court rolls, deeds, and papers, his costs and charges being paid into the hands of the proper officer of the court. 3 Term. R. 275.

ATTORNEY, *letter or power of*. See POWER OF ATTORNEY.

AUCTION, sales by auction are subject to many legal regulations. See 19 Geo. 3. c. 56. and 28 Geo. 3. c. 37.

AUCTIONEER. An auctioneer is an agent lawfully authorized by the purchaser to sign a contract for him, whether it be for lands or goods. And his writing down the name of the highest bidder in his book, is sufficient to bind any other person for whom the highest bidder purchased, even though such person be present, if he do not object before entry. 4 Taunt. R. 209.

An auctioneer receiving money as a deposit on the sale of an estate by auction, knowing that there is a defect in the vendor's title, is answerable to the purchaser for the deposit, though he should have paid it over to the vendor. 1 Marsh. R. 577.

A bidder at an auction may retract his bidding at any time before the hammer is down. 3 Term. R. 148.

And if the vendor of an estate by auction do not show a clear title by the day specified, the purchaser may recover back his deposit, and rescind the contract. 4 Taunt. R. 334.

A purchaser at an auction at an extravagant price, in consequence of all the bidders against him being concealed puffers, and not any of them *bonâ fide* bidders, cannot be compelled to complete his contract. 6 Term. R. 642.

No person shall act as an auctioneer, or dispose of any goods or effects by auction, without a licence from the commissioners of excise; such licence to be renewed annually. See title LICENCE.

Auctioneers, within the limits of the chief office of excise, in London, to give security to the excise in the sum of 1000*l*. with two sureties in the sum of 200*l*. each; to deliver in, within twenty-eight days, a true and particular account of sales; and, without the bills, in the sum of 50*l*. to deliver in a similar account, within six weeks after such sale; and within the fourteen days and six weeks respectively, make payment of the duties.

Auctioneers may make it a condition of sale, that the purchaser shall pay the rates.

The real owner of any estate, goods, or effects, put up at auction, bidding for himself, or any other person bidding in his behalf, shall be allowed the duties, provided notice be given to the auctioneer, in writing, before such bidding; such notice to be verified by the oath of the auctioneer.

There are many exemptions in favour of

sales of estates or chattels, by any rule or decree of the Court of Chancery, or Exchequer Courts in Scotland, East Indies, or Hudson's Bay Companies, Commissioners of Excise, Customs, Ordnance, Navy, Victualling; sales made under any execution or distress; goods imported from British plantations in America, on account of the original importer; ships with their tackle, apparel, and furniture, or the cargoes thereof, condemned as prizes; goods damaged by fire, and sold for the benefit of the insurers; goods woven or fabricated from the loom, in this kingdom, in certain quantities; certain goods, the produce of British colonies in America, imported in British vessels, &c. &c.; property sold to redeem the land-tax, &c. &c.

Two days previous notice of every sale, with an attested catalogue, to be sent by every auctioneer to the excise office, mentioning when and where such sale is to be held, and three days previous notice to be given in the country.

And every auctioneer giving such notice, if within the limits of the excise office, shall, within twenty eight days after the day specified in the notice, for such sale to be made, and, if out of the limits of the excise office, within six weeks after, deliver to the excise office in London, or officer in the country, a declaration on oath, setting forth whether the auction was opened, or any lot bid for, under penalty of 50*l*.

AUDIT, a regular examination of account, by some proper officer.

AUDITOR of the Receipts, is an officer of the exchequer, who files the teller's bills, makes an entry of them, and gives the Lord Treasurer a certificate of the money received the week before. He also makes debentures to every teller, before they receive any money, and takes their accounts. He keeps the black book of receipts, and the treasurer's key of the treasury; and sees every teller's money locked up in the new treasury.

AUM, or **AUME**, a Dutch measure for Rhenish wine, (as an aum of hock) containing forty English gallons. See **AWM**.

AUNCCEL-Weight, an ancient kind of balance, now out of use, being prohibited by several statutes, on account of the many deceits practised by it. It consisted of scales hanging on hooks, fastened at each end of a beam, which a man lifted up on his hand. In many parts of England auncel-weight signifies meat sold by the hand, without scales.

AUNE, a long measure used in France to measure cloth, stuffs, ribbons, &c.; at Rouen it is equal to one English ell, at Calais to 1,52, at Lyons to 1,16, and at Paris to 0,95 parts. See **WEIGHTS AND MEASURES**.

AUREUS, a Roman gold coin, equal in value to twenty-five denarii. According to

Ainsworth, the *aureus* of the higher empire weighed near five pennyweights, and in the lower empire little more than half that weight.

AURICHALCUM, or **ORICHALCUM**, signifies a factitious metal, commonly called brass. It is a mixture of copper and calamine-stone, melted together by a very fierce fire.

AURIPIGMENTUM, or **ORPIMENT**. See title **ARSENIC**.

AUTOMATON, a self-moving machine, or whose principal of motion is within itself, as a clock, watch, &c.

AUTOM, a sort of bark which resembles cinnamon, but is paler and thicker; it is the colour of a broken nutmeg, and full of spangles. It comes from the Levant, and is an ingredient in the carmine dye.

AVAST, a sea term, signifying *stop*, or *enough*.

AVERAGE, is divided into three kinds, viz. 1. *Particular average*, which consists in the extraordinary expences incurred for the ship alone, or for merchandize alone. Such is the loss of anchors, masts, and rigging, occasioned by the common accidents at sea; the damages which happen to merchandize, by storm, prize, shipwreck, wet, rotting, &c.; all which must be borne and paid by the thing which suffered the damage.

2. The *general average*, being those expences incurred, and damages sustained, for the common good and security both of the merchandize, and vessels, consequently to be borne by the ship and cargo, and to be regulated upon the whole. Of this number are the goods, or money, given for the ransom of the ships and cargo, things thrown overboard for the safety of the ship, the expenses of unlading for entering into a river or harbour, and the provisions and hire of the sailors when the ship is put under embargo.

3. The *small averages*, which are the expences of towing and piloting the ship out of, or into, harbours, creeks, or rivers, one-third of which must be charged to the ship, and two-thirds to the cargo. See **INSURANCE**.

AVIGNON-BERRY, the fruit of a shrub, produced in great plenty near Avignon in France; colour green, inclining towards a yellow, used by dyers and painters.

AVOIRDUPOIS-WEIGHT, a kind of weight used in England, the pound of which consists of sixteen ounces. This is the weight for large and coarse commodities, as groceries, cheese, wool, lead, hops, &c. Apothecaries buy their drugs by *avoirdupois-weight*, but sell by troy. The proportion of a pound avoirdupois to a pound troy, is as 17 to 14; or the avoirdupois pound contains 7000 grains, and the troy pound 5760. See **WEIGHTS AND MEASURES**.

AWARD (from the Fr. *agard*). An

award is the judgment and arbitration of one, or more persons, at the request of two parties who are at variance, for ending the matter in dispute without public authority: and may be called an award, because it is imposed on both parties to be observed by them.

The submission to an award may be by bond, covenant, or by an assumpsit or promise; or without all this, by a bare agreement to refer the matter to such a person or persons. 3 *Black. Com.* 16.

By stat. 9 & 10 W. 3. c. 15. it is enacted, that "submissions to awards, by agreement of the parties, may be made a rule of any of his majesty's courts of record; and on a rule of court thereupon, the parties shall be finally concluded by such arbitrament: and, in case of disobedience thereto, the party refusing to perform the same, shall be subject to the penalties of contemning a rule of court, &c. unless it appears on oath that such award was procured by corruption, or other undue means, when it shall be set aside: so as complaint thereof be made to the court before the last day of the next term, after made and published."

The limitation under this stat. to the second term is confined merely to such objections as affect the conduct of the arbitrators: but objections which arise on the face of the award itself, may be made at any time. 2 *Burr.* 701. *Barnes* 56, 57.

Where the submission limits no time for the making of the award, it shall be understood to be within convenient time, and if in such a case the party request the arbitrators to make an award, and they do not, a revocation afterwards will be no breach of the submission. 3 *Keble* 745.

An award can only be binding and effectual amongst those who are parties.

If the submission be without deed, it may be revoked without deed, and the party shall lose nothing. 1 *Bac. Ab. tit. Arb.*

If the submission be by deed, it is of its own nature countermandable, though made irrevocable by the express words of the deed, for the arbitrators being constituted and put in the place of the parties by their consent to act for them, they can no longer act, than while they have such consent. *Ibid.*

The court have no authority, by the stat. of Wm. to make a *parol* submission to an award a rule of court. 7 *Term. R.* 1.

But they have jurisdiction under that statute to make the award, instead of the submission, a rule of court.

If the bond of submission be, "that if arbitrators do not make their award by the day named, then to abide the award of a third, or umpire, to be chosen by the arbitrators," the time for the appointment of such umpire commences when the time for their making their award expires. 4 *Taunt. R.* 252.

Arbitrators may choose an umpire either before, or after, the time limited for making their own award, if the umpire be but chosen within the time limited for the umpirage. 15 *East. R.* 556.

And may choose one immediately previous to their entering upon the examination of the matter referred to them. 1 *Taunt. R.* 509.

When an arbitrator has power to enlarge the time for making his award to any other day, he may enlarge it more than once. 1 *Taunt. R.* 509.

And any day will be construed any days. 4 *Taunt. R.* 658.

Arbitrators appointed to arbitrate a certain measure contemplated, as, for instance, a dissolution of a partnership, they are not necessarily bound to direct that such partnership shall be dissolved. 1 *Taunt. R.* 549.

After the delivery of an award, an arbitrator cannot correct a mistake (as in the calculation of figures), by making another award, though within the time limited by the submission.

As an award is in nature of a judgment, it ought to be wholly decisive, for if it doth not determine the matter, it becomes a new controversy; therefore if the arbitrators award a bond for quiet enjoyment of lands, without appointing a certain sum, or direct one party to give to the other a good security for a certain sum of money, without saying what security; or to pay for so many quarters of malt sold according to the market price, or without ascertaining what that price was, this is a void award, and the party is not obliged to give bond to the value of the land; for then the sense of the award must be supplied by averment; now if it hath the credit of a judgment, there can be no interpretation made of the award, but by the words of the award itself; for if it receives its meaning from any matters out of the award, the mind of the arbitrators is only guessed at, and not expressed; but the parties intended to be obliged only by what the arbitrators themselves declare to be their award, and the bond to be according to the value, they cannot assign their power to any person to assess the value. 5 *Co.* 77. *Cro. Eliz.* 432.

But an award directing one of two things to be done in the alternative, if either of them is capable of being performed, is good, and ought to be carried into execution. 1 *Taunt. R.* 549.

The awarding of costs is incidental to the power of an arbitrator: the provision therefore on the reference, that the costs shall abide the event of the award, is a restriction of the power which he necessarily hath of giving costs at his election. 2 *Term. Rep.* 644.

And the award of costs to be taxed by the proper officer, doth not include the costs of the reference, but is merely confined to the

costs of the action. 1 *H. Black*. 215. But if no directions be given by arbitrators respecting costs, they are to be paid by both the submitting parties equally. 1 *Taunt. R.* 165.

An award, "that each party shall pay his own costs, and certain actions shall be discontinued," is final and good. 9 *East. R.* 497.

If either of the parties submitting a matter to arbitration die before award made, it is a revocation of the arbitrator's authority, and the award made subsequently to such death would be set aside. 1 *Marsh. R.* 566.

AWLS, (GER. *Ahlen*. DU. *Elsen*. DA. *Sycle*, *Syle*. SW. *Syl*. FR. *Alènes*. IT. *Lesine*. SP. *Lesnas*. PORT. *Sovelas*. RUS. *Schilo*. POL. *Szydla*.) a sharp pointed iron instrument, used for boring holes. Shoemakers, saddlers, and some other mechanics use awls for the purpose of making small apertures in the leather, &c. for the admission of waxed cord, thread, &c. whereby the stitches are formed. A sort of short awl is used by carpenters for boring holes in the covers of boxes, chests, &c. in order that the nails, being driven in, may not split the wood. Awls of this description are usually denominated brad-awls; the iron part of this instrument is round, while that used by shoemakers is flat and curved. Large quantities of awls are manufactured at Birmingham and in its neighbourhood.

AWM, or **AUM**, a measure of Rhenish wine, containing 40 English gallons, mentioned in the statute, 1 Jac. 1. c. 33. and 12 Car. 2. c. 4. *Aum* is considered as a Dutch measure, answering to what is called

in England, a tierce, or one seventh of an English tun, and one-sixth of a tun in France.

AWNING, on board a ship, is when a sail, tarpaulin, &c. are hung over any part of the ship, to keep off the sun, rain, or wind.

AXES, (GER. *Aexte*. DU. *Asten*. DAN. *Oxer*. SW. *Yxor*. FR. *Coignées*. IT. *Appié*. SP. *Hachas grandes*. PORT. *Machados grandes*.) instruments consisting of a metal head, with a sharp edge, fixed in a handle. They are used by carpenters, &c. for cutting wood, &c.

AXUNGIA *vitri*, sandiver, or salt of glass, a kind of salt which separates from the glass, while it is in fusion. It is of an acrimonious and biting taste. The farriers use it for clearing the eyes of horses. It is also used for cleaning the teeth, &c.

AZIMUTH *compass*, an instrument adapted to find, in a more accurate manner than by the common sea-compass, the sun's or star's magnetical amplitude, or azimuth.

AZOGA *ships*, Spanish ships, commonly called the quicksilver ships, from their carrying quicksilver to the Spanish West Indies, in order to extract the silver out of the mines of Mexico and Peru. These ships, strictly speaking, are not to carry any goods unless for the king of Spain's account; but by procuring special licences, they are enabled to take in a full cargo for merchants, as well as the sovereign.

AZURE, a name for a celebrated blue colour, prepared from *lapis lazuli*, and generally called *ultramarine*. See **ULTRAMARINE**.

B A A

B A C

B, the second letter of the alphabet, is used as an abbreviation; in music, B stands for the tone above A; B also stands for bass, and B C for basso continuo, or thorough bass. As a numeral, B was used by the Greeks and Hebrews, to denote 2; but among the Romans, for 300, and with a dash over it, (thus $\overline{B}$) for 3000. The same people likewise used B for Brutus, B. F. for *bonum factum*. B, in the old chemical alphabet, signifies mercury; B. A. stands for Bachelor of Arts; B. L. for Bachelor of Laws; and B. D. for Bachelor of Divinity.

BAAT, in *Siamese*, and *Tical* in *Chinese*, is both a weight and coin current in the two empires; the *baat* is of silver, and, as a weight, answers the English half ounce. It is there four mayons, (in *Siamese* seling) the mayon two fouangs, the fouang four payes, and the paye two calms; here are also som-

payes, in value half a fouang. All these weights are also coins, or at least bits of silver that pass in lieu of them, as well in China as in Siam. The tical weighs three gros and twenty-three grains, which reckoning the ounce of silver at three livres and a half *Tournois*) is thirty-two sols and four deniers as money, for it weighs nearly half an ounce. The form of the *baat* is square, and as it is subject to great alterations from the wearing down of the angles, strangers should not take it as a weight or coin, till its value is known. See **WEIGHTS AND MEASURES**.

BABYLONICA TEXTA, a rich sort of weavings or hangings, so denominated from the city of Babylon, where the practice of weaving divers colours in their hangings was first invented.

BACCALAO. See **BARCALAO**.

BACHELOR is said to be a feudal

term expressive of inferiority of rank, whence it has been adopted among our titles of honour, as well those conferred by the sovereign, as those by certain public bodies; the former for military, the latter for scientific, achievement. Thus the kings of England have been used to bestow the title of *Knight Bachelor* being the lowest order of knighthood, inferior to those of Knights Banneret, and Knights of the Bath, on such as they wished to distinguish above the ordinary gentry. 1 *Black. Com.* 404.

The universities also confer the title of bachelor as the first, or lowest, on those who, having finished their studies and resided the necessary time, are to become graduates, or to take their degrees, according to the technical phraseology of those learned bodies. There are bachelors of arts, of law, of physic, of music, and of divinity.

The most ordinary acceptation of the word (remotely derived from one of the qualifications of a knight bachelor under the feudal regime) is that of merely an *unmarried man*. In this sense it is used in all the modern statutes for raising what are denominated the *assessed taxes*, by which every unmarried man is directed to make his return with the addition of a capital B, denoting bachelor, that he may be assessed double on that account.

BACK, in brewing, a large flat kind of tub or vessel, in which the wort is put for cooling. The ingredients of beer pass through three kinds of vessels; they are mashed in one, worked in another, and cooled in a third. See BREWING.

BACK the sails, is to put them in a situation that will occasion the ship to retreat or move a-stern.

BACK-STAFF, an instrument to take the sun's altitude. It consists of two concentric arches, the greater of which is divided into 30 degrees, and every degree into 5 minutes, by means of diagonal lines, and the lesser into 60 degrees. There are likewise three vanes belonging to it; that upon the arch of 30 degrees, being called the sight vane; that upon the arch of 60 degrees, the shade vane; and the other, in the centre of the arches, the horizon vane.

To find the sun's altitude by this instrument, fix the shade vane on the 60 degrees arch, at or about 15 or 20 degrees less than the complement of the altitude; and turning your back towards the sun, move the sight vane up and down till the sun's image fall on the horizon vane, and at the same instant you see the horizon through the slit in the horizon vane; then will the degrees cut by the shade vane on the arch, being added to those cut by the sight vane on the other arch, be the sun's zenith distance at that time, which being subtracted from 90 degrees, will give his altitude.

BACK-STAYS of a ship. See STAYS.

BACON (GER. *Speck*. DU. *Spek*. DA. *Flesk*. SW. *Fläsk*. FR. *Lard*. IT. *Sr*. and PORT. *Lardo*. RUS. *Solo*. POL. *Slonina*. LAT. *Lardum*.) is made from the sides and belly of the pig, which are first thoroughly impregnated with salt, then suffered to remain for a certain period in brine, and lastly dried and smoked in places, called drying-houses. Those counties of England particularly celebrated for bacon, are Yorkshire, Hampshire, Berkshire, and Wiltshire. Ireland also produces immense quantities of bacon, but it is neither so clean fed, nor so well cured, as the English, but much lower in price. Scotland, especially those parts of it on the borders of England, have recently cured very large quantities of pork and bacon, with which no inconsiderable portion of the London markets are supplied, and it is excellent in quality.

Bacon makes an important article of exportation, especially to our West Indian colonies.

BADIAN, or **BADIANE**, Indian anniseed; the seed of a tree which grows in China, and smells like our anniseed, or as it is usually called by contraction *aniseed*. The Chinese, and the Dutch, in imitation of them, sometimes use the *badian* to give their tea an aromatic taste.

BAETAS, so called by the Spaniards and Portuguese, is a sort of woollen stuff, which is not crossed, and which is called in France *baguette*, or *bagette*.

BAFFETAS, or **BASTAS**, or **BAFTAES**, a cloth made of coarse white and blue cotton thread, which comes from the East Indies. Those of Surat are the best.

BAG. A great variety of articles in commerce are sold by the *bag*, which means no more than that the *bag*, being made of a determinate size, is supposed to contain a certain weight, which is taken in the gross without weighing, for the sake of expedition; but in this case bags or sacks are generally proved and sealed, or marked under the inspection of the magistracy of the places where they are in use, otherwise they are not to be relied on.

A *bag* of hops is from 2½ to 3 cwt.; of almonds, 3 cwt.; of aniseed, from 3 to 4 cwt.; of pepper, from 1½ to 3 cwt.; of goats' hair, from 2 to 4 cwt. &c.

In France, they make *bags* of pistoles, of louis-d'ors, *bags* of a thousand livres, or crowns, *bags* of small pieces of silver coin, &c. Tare is allowed for the *bag*, as five sols per *bag* of 1000 livres.

BAGAUZ, a name given to the sugar-canes, after they have passed through the mill in the West Indies; they are kept under cover in small huts in order to use them, when dry, for boiling the sugar. These huts are called the *bagauz* huts.

BAHAR, **BAHAIRE**, or **BARRE**, a weight used in several places in the East Indies.

There are two sorts of this weight, the one the great bahar, with which are weighed pepper, cloves, nutmegs, ginger, &c. and contains about 5 cwt. and 24 pounds 9 ounces, avoirdupois weight. With the little bahar are weighed quicksilver, vermilion, ivory, silk, &c. It contains about 437 pounds 9 ounces.

BAIL, in law, the setting at liberty one arrested, or imprisoned, upon a suit either civil or criminal, upon sureties taken for his appearance at a day and place assigned. In civil cases the bail is either common, or special. Common bail is a matter of course, being nothing but a mere form upon appearance, after personal service of the writ, and notice to appear served upon the defendant. If he appear thereto, his attorney puts in imaginary sureties for his future attendance, as John Doe and Richard Roe. But if the plaintiff will make affidavit that this cause of action amounts to 10*l.* or upwards, in order to arrest the defendant, and make him put in substantial sureties for his appearance, called special bail; it is then required that the true cause of action be expressed in the body of the writ or process. 3 *Black.* 287.

Special bail, are two or more persons, who, after the arrest, undertake generally, or enter into a bond to the sheriff in a certain sum, to insure the defendant's appearance at the return of the writ; this obligation is called the bail-bond.

Bail in criminal cases.—Upon offering sufficient surety, bail may be taken either in court, or in some particular case, by the sheriff, coroner, or other magistrate, but most usually by justices of the peace.

BAILE. Thus they style at Constantinople the ambassador of the republic of Venice, who resides at the Porte.

BAILE, or **BALE**, in the sea-language. The seamen call throwing the water by hand or small vessels out of the ship's or boat's hold, *bailing*. They also call those hoops that bear up the tilt of a boat, its bails.

BAILIFF, a keeper or protector. Hence the sheriff is considered as bailiff to the crown; and the county of which he has the care, and in which he is to execute the king's writ, is called his bailiwick; so also his officers who execute writs, warrants, &c. are called bailiffs.

BAILIFF, *Water*, an officer appointed in all port-towns, for searching of ships, gathering the toll for anchorage, &c. and arresting persons for debt, &c. on the water. Bailiff is still applied to the chief magistrate of several corporate towns. The government of some of the king's castles is also committed to persons called bailiffs, as the bailiff of Dover Castle.

BAILIFFS of courts baron, summon those courts, and execute the process thereof; they present all pound-broaches, cattle strayed, &c. &c.

BAILLOQUE, or **BAYOQUE**. Thus the French call those ostrich-feathers, which are of a dark brown colour, mixed with white. This kind of feather is seldom dyed; but the feathers are well washed with soap, which gives them a bright glossy appearance. These *bailloque* feathers are the least valued.

BAILMENT, in law, is a delivery of things, whether writings, goods, &c. to another, sometimes to be delivered back to the bailor, that is, to him who so delivered them; sometimes to the use of the bailee, that is, of him to whom they are delivered; and sometimes also to be delivered to a third person; this delivery is called a *bailment*. 2 *Black.* 451.

In a great commercial metropolis, the law of bailment is of the greatest importance, and the general principles of it extremely necessary to be rendered intelligible. There are generally admitted to be six species of bailment. *Ld. Raym. R.* 909.

1st. A mere *deposit* to keep for the use of the bailor.

2d. *Accommodation*, or the delivery of things useful in themselves, to be returned in *specie*.

3d. A delivery of articles for *hire*.

4th. A delivery by way of *pledge*.

5th. A delivery of things to be *carried for a reward*.

6th. A delivery of things respecting which something is to be done (as carrying, for example,) *without reward*.

On the 1st. The bailee is not liable *but for gross neglect*.

On the 2d. He is answerable for *every degree of neglect*.

On the 3d. He is bound to take all *imaginable care*, and only exonerated by circumstances that exceed *all reasonable caution*.

On the 4th. (Which is the case of pawn-brokers.) The bailee or pawnee has a special property, which is in the nature of a security, to compel the pawnor to pay. He is bound to exercise all ordinary caution in merely *keeping* the articles pledged; and if he *use* them also, he does it at his own peril of their being lost or deteriorated. See *further*, title **PAWNBROKER**.

On the 5th. By the laws of England, a carrier for reward is liable *at all events*; and nothing discharges him of responsibility but the act of God, or the king's enemies. See *further*, title **CARRIER**.

On the 6th. It seems, the responsibility attached to the bailee is qualified and conditional. He is answerable for wilful injury and for absolute neglect, but discharged from responsibility for injury arising from extraneous causes, against which ordinary caution was not sufficient to provide. *Jones on Law of Bailment*.

BAIÖCAO, or **BAYOC**, a copper coin, current at Rome, and throughout the whole

state of the church, tea of which make a julio, and an hundred a Roman crown. At Rome, Civita Vecchia, &c. the baiocao passes for three-fourths of a penny English; at Bologna and Ravenna it is worth three-fifths of a penny only.

BAIZE, (GER. *Boy*. DU. *Bay*, *Baay*. DA. *Bay*. SW. *Boj*. FR. *Bayette*. IT. *Bajetta*. SP. *Bayeta*. PORT. *Baeta*, *Baetilha*. RUS. *Baika*.) a sort of coarse open woollen stuff, having a long nap, sometimes frized, and sometimes not. This stuff is without wale, and is wrought on a loom, with two treddles, like flannel. It is manufactured at Colchester and Bocking, in Essex; Rochdale, in Lancashire, and many other places. At Colchester there is a hall called the Dutch Bay-hall, or Raw-hall. By the statute 12 C. 2. c. 22. no person shall weave at Colchester any Baize, known by the names of four-and-fifties, sixty-eights, eighties, or hundred *baize*, but, within two days after weaving any such, shall carry it to the Dutch Bay-hall, to be viewed and examined, that it may appear whether it be well and substantially wrought, before it be carried to be scoured and thickened. No scourer or thickener shall receive any such *baize*, before it has been marked or stamped at the said hall. This manufacture, which is very considerable, was first introduced into England with that of says, serges, &c. by the Flemings, who being persecuted by the Duke of Alva for the sake of religion, fled hither, about the fifth year of Queen Elizabeth's reign. There are considerable manufactures of *baize* at Beauvais, Castres, Montpellier, and Nismes, in France; also at Tournay, Lisle, &c. in Flanders. The export of baize is very considerable to Spain and Portugal, where they are called *baetas*. Their chief use is for dressing monks and nuns, and for linings, especially in the army; and, in this view, much is now exported to every part of the South American continent, especially the Brazils. The looking-glass makers also use them behind their glasses, to preserve the tin, or quicksilver, and the case-makers to line their cases. The breadth of *baize* is commonly a yard and a half, a yard and three quarters, or two yards, by forty-two to forty-eight in length. Those of a yard and three quarters are fit for the Spanish and Brazilian markets.

BAKER, a person whose occupation or business is to prepare bread, or to reduce meals of any kind, whether simple or compound, into bread, biscuits, &c.

The statutes for the regulation of bakers, as well those which apply to the kingdom at large, as those which are peculiar to the metropolis and the bills of mortality, are numerous. The notice of many of them will be more appropriately applied under title **BREAD**; but it is necessary here to

observe, that 31 G. 2. c. 29. (amended by many subsequent acts, especially 50 G. 3. c. 73.) is the foundation of all the modern regulations respecting bakers in general. By these they are prohibited from adulterating flour with other ingredients than the genuine meal of the grain, of which the bread purports to be made; from selling bread deficient in weight; from selling at a price more than is allowed by the assize; from mixing, or even from having in possession, noxious ingredients; from baking or delivering bread, meat, &c. on the Lord's day, except within certain specified hours, &c. under severe penalties, severally recoverable before justices of the peace. 1 *Dick. Pract. Exp.* 184.

The 55 G. 3. c. 99. is the most recent and most comprehensive statute respecting the regulation of bakers within the metropolis, bills of mortality, and 10 miles of the Royal Exchange. By that statute, the assize of bread, within the district to which it applies, is abolished, but the weight of bread is fixed; the bakers are prohibited from mixing flour with any meal other than that of which the bread purports to be made; from adulterating it with noxious ingredients; from obstructing officers coming to search their premises; and from exercising their trades on the Lord's day, except under certain restrictions as to time; and all these under severe penalties, recoverable before justices of the peace, in like manner as by the former statutes already referred to.

Magistrates, or peace officers by their warrants, may at seasonable times search bakers' premises, and if any adulterated flour, bread, alum, or other ingredient be found, it may be seized and disposed of.

If any baker shall make it appear that any offence for which he shall have paid the penalty shall have been occasioned by the wilful default of a servant, the justice may order his servant to make recompence, and if unable, commit him to hard labour, for not exceeding six months.

Persons forswearing themselves, are guilty of perjury. 3 *Dick. Pract. Expos.* 99.

BALANCE, or **BALANCES**, (GER. and DU. *Waagen*. DA. *Vægt*. SW. *Vagar*. FR. *Balances*. IT. *Bilancie*. SP. *Balanzus*, *Peso*. PORT. *Balanças*. RUS. *Wässii*. POL. *Szale*, *Wagi*.) in mechanics, one of the simple powers which serve to find out the equality or difference of weight in heavy bodies. The *balance* is of two kinds, ancient and modern; the ancient, or Roman, called the *statera Romana*, or steel-yard, consists of a lever or a beam, moveable on a centre, and suspended near one of its extremities; on one side the centre are applied the bodies to be weighed, and their weight, measured by the divisions marked on the beam, in a place where a weight moveable along the beam, being fixed, keeps the balance in

equilibrio. This is still used in markets, &c. where large bodies are to be weighed.

The modern *balance*, now commonly in use, consists of a lever or beam, suspended exactly by the middle, and a scale suspended at each extremity. The principle on which each is founded is the same, and may be easily conceived. See *ante*, AUNCCEL.

BALANCE in the account of merchants, is when the debtor and creditor sides of any distinct account are equal. When that is the case, such account is said to be "balanced."

BALANCE of a merchant's or trader's books. This is a branch of the art of accountantship. In the method of keeping the books of traders, according to that admirable art of charge and discharge, by double entry, such books, if kept as they ought to be, will be always fit for a general balance; for such is the excellency of that method, that the books of themselves must be necessarily upon a balance on the whole, though not in every distinct account, throughout the ledger.

BALANCE of trade, is the equality between the value of the commodities bought of foreigners, and the value of the native productions transported into other nations.

It is reckoned that that nation has the advantage in the balance of trade, which exports more of native commodities, and imports less of the foreign; so that the nation grows so much richer in bullion as the balance of that trade amounts to, which must be made up of bullion or money. See further, title BULLION.

BALANCE of a clock or watch. See the article CLOCK-WORK.

BALANUS *Myrepsica*, in pharmacy, the *ben-nut*. The tree which produces this fruit, is common on the mountains of Arabia. The oil extracted from this fruit is used by perfumers for preserving the scents of flowers, as jasmine, orange, tuberose, &c.

BALASTRI. Thus they call at Smyrna the finest gold cloths that are manufactured at Venice, and which the Venetians carry into the ports of the Levant.

BALAZEES, or **SAUVAGAZEES**, of Surat, are white cotton cloths, manufactured in that city. They are thirteen French ells and a half in length by two-thirds in breadth.

BALE, a pack, or certain quantity of goods or merchandise; as a *bale* of silk, cloth, &c. This word is used in the statute 16 R. 2. and is still in use.

The *bales* are always marked and numbered, that the merchants to whom they belong may know them; and the marks and numbers correspond to the same in the bills of lading, &c. Selling under the *bale* or under the *cords* is a term used in France and other countries for selling goods whole.

sale, without sample or pattern, and unopened.

Bale merchandise is a term of contempt in France and Flanders, by which are described common hardware, and other low goods that are manufactured slightly, and sold in *bales* at a very low price.

BALKS, (GER. and DU. *Balken*. DAN. *Bielker*. SW. *Balkar*. FR. *Poutres*, *Solives*. IT. *Travi*. SP. *Vigas*. PORT. *Traves*. RUS. *Brewna*. POL. *Balky*.) is used to signify the large pieces of timber brought from Norway, &c. and among bricklayers, the large beams used in making scaffolds, &c.

Balks, in agriculture, commonly called *grass balks*, are the ridges or banks between two furrows, or parcels, of arable land.

BALLAST, (GER. DU. and SW. *Ballast*. DA. *Baglast*. FR. *Lest*. IT. *Savorra*. SP. *Lastre*. PORT. *Lastra*.) a quantity of stones, gravel, sand, or any other heavy material, laid in a ship's hold, in order to make her draw the more water, and render her stiffer, or more capable of carrying sail, without oversetting. The ballast is sometimes one-quarter, or one-third, or one-half of the ship's burthen, according to the difference of bulk. Flat vessels require the most ballast. The following table will exhibit in one view the quantity of ballast allowed to ships of different sizes:

Ballast allowed to the following Ships:

Guns.	Tonnage.	Iron Tons.	Shingle Tons.
110	2290	180	370
100	2090	180	370
98	2110	160	350
90	1870	160	350
80	1620	140	300
74	1700	80	270
64	1570	70	260
50	1100	65	170
44	900	65	160
38	930	70	170
56	870	65	160
32	700	65	140
28	600	60	100
24	500	50	80
22	450	50	70
20	400	50	60
Sloop	300	50	40
Brig	160	30	15
Cutter	—	20	} seldom any.
Sloop	—	15	

The iron ballast is first stored fore and aft, from bulk-head to bulk-head; then the shingle ballast is spread and levelled over the iron.

Ships are said to be in ballast when they have no other loading. Masters of vessels are obliged to declare the quantity of ballast they bear, and to unload it at certain

places. They are prohibited unloading their ballast in havens, roads, &c. under a penalty of 10*l.*, by 54 Geo. 3. c. 159. *See title HARBOUR.*

All masters of ships lying in the river Thames, shall pay to the corporation of Trinity-house, for all ballast demanded and entered at the ballast-office, the rates following, viz. for every ton consisting of twenty hundred weight, carried to any ship employed in the coal trade twelve-pence, and for every ton carried to any other British ship, fifteen-pence; and for every ton carried to any foreign ship, nineteen-pence, and the corporation of Trinity-house shall pay for the raising and carrying every ton of ballast nine-pence, whereof six-pence shall be paid to the two ballast-men, and three-pence for the use of the lighters. 32 G. 2.

BALLIAGE, a small duty paid to the city of London by aliens and others for certain commodities exported by them, which they claim by their charter, dated the fifth day of September, in the sixteenth year of the reign of King Charles II. confirmed by the twentieth rule of the book of rates, and by 2 W. and M. c. 8.

BALLIN, so called at Bourdeaux, Bayonne, &c. what at Paris and elsewhere they call *emballage*, or packing, &c.

BALLOON, or **BALLON** in a colloquial sense, signifies any spherical hollow body, of whatever matter it is composed, or for whatever purposes it is designed.

BALLOON, in the French paper trade, is a term for a quantity of paper, containing twenty-four reams. It is manufactured at Marseilles, and called paper *à la croizette* (or paper with the little cross), of which large quantities are sent to Constantinople, and there sold by the *ballon*. The paper made with a crown mark in it, in Provence in France, is very fit for the Levant trade, where it is sold for Venice paper: of this quality there are only fourteen reams to the *ballon* or *ballon*.

BALLON, called also **BALLOT**, in the glass trade of Lorrain, signifies a certain quantity of glass plates, smaller or greater, according to their quality. The *ballon* of white glass contains twenty-five bundles, of six plates per bundle; but the *ballon* of white coloured glass is only of twelve bundles and a half, and of three plates to a bundle.

BALLON, or **BALON**, a sort of brigantine of the kingdom of Siam, to navigate up and down the rivers, and carry on the inland trade, made of the trunk of one single tree, in a hollow manner, and managed with oars.

BALLOT signifies a ball, or ticket, used in giving votes privately.

BALLS, this term comprehends all sorts of bullets for fire-arms, from the cannon to the pistol. Cannon-balls are of iron; musket-balls, pistol-balls, &c. are of lead.

The experiment has been tried of iron balls for pistols and fuses, but they are justly rejected, not only on account of their lightness, which prevents them from flying straight, but because they are apt to furrow the barrel of the pistol. Cannon-balls are distinguished by their calibres thus:

A 42	} pound ball, the diameter of which is	6,684 inches.
52		6,105
24		5,547
18		4,040
12		4,403

Chain-balls, are two balls linked together by a chain of eight or ten inches long, and some have been made with a chain of three or four feet long: they are used to destroy the palisadoes, wooden bridges, &c. of a fortification; they are also very destructive to the rigging of a ship. *See ARTILLERY.*

BALM. *See BALSAM.*

BALSAM, (GER. *Da. Sw. Rus. & Pol. Balsam. Du. Balsem. Fr. Baume. It. Sp. & Port. Balsamo. Lat. Balsamum*.) or *native balsam*, an oily, resinous, liquid substance, flowing either spontaneously, or by means of incision, from certain plants. There are many kinds of balsam, but the most remarkable are Benzoin, Storax, Peru, Tolu, Capaiba, Gilead, and Rakasira. They owe their most important properties to the resinous ingredient and benzoic acid.

1. *Benzoin*, commonly called *gum benzoin*, will be found at large under the head **GUM**.

2. *Storax*. This substance is obtained by incision from the *styrax officinalis*, a tree which grows abundantly in the islands of the Levant, and in Italy and France. The storax is sometimes in large masses, sometimes in small tears; it is brittle, and has a brown colour. It has an aromatic taste, and fragrant smell. It is soluble in alcohol, and yields benzoic acid by the usual processes. It is composed apparently of benzoic acid, and a peculiar resin. It is principally used as a perfume.

3. *Balsam of Peru*. This substance is obtained from the *myroxylon peruiferum*, which grows in the warm parts of South America. The tree is full of resin, and the balsam is obtained by boiling the twigs in water. It has the consistency of honey, a brown colour, an agreeable smell, and a hot acrid taste. Like the last it consists of benzoic acid and volatile oil, not completely converted into resin. Water dissolves part of the acid, alcohol the whole balsam. It is easily volatilized by heat. It is used as a cordial medicine, and as an external application to wounds.

4. *Balsam of Tolu*. This substance is ob-

tained from the *toluifera balsamum*, a tree which grows in South America. The balsam flows from incisions made in the bark. It comes to Europe in small gourd shells. It is of a reddish yellow colour, and considerable consistence: and when exposed to the air, it becomes solid and brittle. Its smell is fragrant. The composition of this substance has not been ascertained. It is only from analogy that it has been put among the balsams. Mr. Hatchett's experiments on it are very curious and important. He has ascertained that the balsams in general are soluble in alkalies. When Tolu is dissolved in the smallest possible quantity of lixivium of potash, it completely loses its own odour, and assumes a most fragrant smell, somewhat resembling that of the clove pink. "This smell," Mr. Hatchett observes, "is not fugitive, for it is still retained by a solution which was prepared in June, and has remained in an open glass during four months." Mr. Hatchett found that it dissolved in nitric acid, with nearly the same phenomena as the resins; but it assumed the odour of bitter almonds, which leads him to suspect the formation of prussic acid.

It is used in medicine, in coughs arising from a want of due secretion from the lungs.

5. *Balsam of Copaiba* is obtained by incision of the trunk of the *copaibifera officinalis*. *Lin. Sp. Pl.* 557. It is colourless when first obtained, but becomes yellow by time, without losing its transparency. The smell is fragrant; the taste aromatic, bitter, somewhat sharp, and very permanent on the tongue. It is occasionally adulterated with turpentine. This may be detected by the smell on rubbing it between the fingers. Balsam of copaiba is of considerable use in medicine, particularly in restraining inordinate mucous discharges.

6. *Balsam, or Balm of Gilead*, is obtained from an evergreen tree, or shrub, of Arabia. The finest is of a greenish colour, and obtained by incision of the branches, called *opobalsam*. The second is called *carpopalsam*, expressed from the fruit, which is about the size of a small pea, with a short pedicle, of a roundish or oval figure, pointed at top, composed of a dark brown or reddish-black wrinkled bark, marked with four ribs from top to bottom, and a whitish or yellowish medullary substance. The third sort is called *xylobalsam*, and obtained from a decoction of the branches. A sort which is said to flow naturally from the branches of the tree, has been called *balsam of Mecca*. It has a strong pungent smell, like that of turpentine, but more fragrant, and a bitter acrid taste. When recent it is turbid and whitish, but on being kept it becomes thin, nearly transparent, greenish, and then of a golden yellow; after which it is thick, like turpentine, and loses much of its fragrance.

Its smell resembles a mixture of rosemary and sage flowers.

It is chiefly used in the East as a cosmetic; it is sometimes given as a medicine, and partakes of the general properties of the balsams, which are those of a stimulant, expectorant, and diuretic medicine.

7. *Balsam of Rakasira*. This name has been given to a balsam brought from the East Indies; but its source we are ignorant of; and it has been supposed to be an artificial composition. In its qualities it resembles the Tolu balsam.

Such are the balsamic substances already known. *Tar*, which has been sometimes placed among them, is obtained by a rude distillation of the fir. Hence it contains a variety of ingredients, oil, resin, pyroligneous acid, and water. When concentrated by heat it loses these volatile parts, and is converted into *pitch*; a substance which possesses the properties of resin.

BAMBOO, or BAMBOU, is a plant which multiplies very much by its root, whence springs a ramous or branchy tuft, after the manner of the European reeds. The Indian *bamboo* is the largest kind of cane that is known. It is of an extraordinary height and bigness when it bears its blossom. With these *bamboo-canes* the Indians build their houses, and make all sorts of furniture in a very ingenious manner. The thickest *bamboes* serve to make the sticks or poles with which the slaves or other persons carry those sort of litters which are called *palanquins*, and are so common in use, and so convenient in all the East. They likewise make of them a kind of pails, in which the water keeps extremely cool. The walking-canes we see in Europe are the first and smallest shoots of the *bamboes*. Two pieces of *bamboo* of a certain bigness, being rubbed hard against each other after a certain manner will produce fire; and when the Indians cannot get any by other means, they obtain it in that way. The Malays and the Chinese who are dispersed in the Molucca and Sunda Isles, use the young shoots of the *bamboes* preserved in vinegar after their manner, with very strong or peppered ingredients. This they call *achiar-bamboo*, or *achia*.

BAN, a fine smooth muslin, manufactured in the East-Indies. The breadth is nearly a yard, and in length it runs about twenty yards and a half.

BAN, or BANS, an old British word signifying proclamation, or public notice; whence comes the application of it to the notice directed to be published in the parish church before marriage, to the end that if any person know any just cause why the intention of the contracting parties, thus *publicly proclaimed*, should not be carried into execution, he may have an opportunity of forbidding it, by stat. 26 G. 2. c. 33., commonly

called the Marriage-act. This public notice or ban, is required to be made on three Sundays preceding the solemnization of marriage, without which (unless licensed by episcopal authority,) every marriage shall be null and void, and the minister solemnizing it shall be guilty of felony.

BANCO has been generally considered as a genuine Italian word, signifying what we denominate a bank, and commonly used to describe the bank of Venice. Some, probably with more fancy than foundation, derive it from another source. *See post, title CASH.*

Banco is also used to describe Banco-money from current-money, at Hamburgh, &c. *See EXCHANGE.*

BAND, a weight used on the Gold Coast for weighing gold dust. It is equal to two ounces troy.

BANDAL, or BANDLE, the name of a measure in the south and west of Ireland, which is something more than half a yard; by it the coarse narrow linen is sold in the markets, on which account it is called *bundle-cloth*.

BANDANNOES, silk handkerchiefs, generally red, spotted with white, manufactured in the East Indies.

BANDELIERS. *See IRON.*

BANDSTRINGS. *See BONELACE.*

BANIANS, or BENJANS, a tribe of Indians dispersed over all Asia, through whose hands passes almost the whole trade with the Europeans in those parts. They are the third sect of the heathens who dwell in the East Indies. The *Banians* and the Chinese are the greatest traders in the Indies, to whom must also be added the Jews and the Armenians, who are greatly dispersed over those parts. But the most considerable trade is carried on by the *Banians*, in the whole peninsula on this side the Ganges. They are extremely skillful in commerce; are brokers and likewise bankers, and there are few places in the East Indies, for which they cannot furnish bills of exchange.

BANK, a common repository, where many persons agree to keep their money, to be always ready at their call or direction: or certain societies or communities, who take the charge of other people's money, either to improve it, or keep it secure.

There are banks of various kinds, and different in the nature of their constitutions and establishments: some are instituted wholly on the public account, and put under the direction of the magistrates, as the famous bank of Amsterdam, where the money deposited was to be always kept for the use of the proprietors, and never to be let out for profit or advantage.

A second sort of bank is such as consists of a company of monied men, who being duly established, and incorporated by the

laws of their country, agree to deposit a certain considerable fund, or joint stock, to be employed for the use of the society; as lending money on good security, buying and selling bullion, gold and silver, discounting bills of exchange, &c. Such is the Bank of England, which was established in the year 1694, with a capital of 1,200,000*l.* This they lent to government, for which eight $\frac{1}{2}$ cent. interest was paid, and 4000*l.* $\frac{1}{2}$ annum for charges of management. The corporation was entitled "The Governor and Company of the Bank of England," and their charter directed that there be a governor and twenty-four directors; it also lays down rules respecting the qualifications of voters and of directors, with other regulations. In 1697, the bank was allowed to enlarge its capital to 2,201,171*l.* 10*s.* for the purpose of supporting public credit, bank notes being then at 20 $\frac{1}{2}$ cent. discount, owing to the want of punctuality in the payments of government. This capital has been since increased from time to time, as the necessities of the times and the dependence of the government on the bank, for anticipating the supplies, has predominated. Hence it follows that the Bank of England acts not only as an ordinary bank, but as a great engine of state. It receives and pays the greater part of the annuities which are due to the creditors of the public; it circulates exchequer bills; and it advances to government, the annual amount of the land and malt taxes, which are frequently not paid up for some years. It discounts bills of merchants, and upon different occasions it has supported the credit of the principal houses, not only of England, but of Hamburgh and Holland.

The company is properly a trading company; and that which is peculiarly distinguished by the appellation of *bank-stock*, is a trading stock, the dividend of which, on the capital, besides occasional bonuses, accrues from the annual income of the company; and this arises from the interest received for the money advanced by the proprietors to the public, on the permanent debt, from interest on annual temporary advances, from profits of their dealings in bullion, and of their discounts; from the interest of stock held by the company; and and from the sums allowed by government for the management of the annuities paid at the offices of the bank.

It appears by some recent discussions in parliament, that the gross returns to the bank, from its transactions with the government, are 1,590,898*l.* per annum, the national debt being 860 millions.

The Method of opening an Account with the Bank of England.

The accounts opened with the bank, are either *cash accounts*, or *discount accounts*.

The person wishing to open a cash account, must apply to the chief clerk of the drawing-office in the hall, who, upon the receipt of 500*l.* (which is the lowest sum that an account can be opened for) will deliver the necessary book to the party, with a quantity of checks, on which he draws out such sums as he occasionally requires.

To open a discount account, the party must apply to a director; and such application must be laid before the court of directors for their approbation, which, if obtained, application is also made to the chief clerk of the drawing-office, who takes the signatures in a book kept for the purpose, where the accounts are also kept, and, when required, powers of attorney are granted, to enable persons to act for their principals.

The chief clerk of the drawing-office then delivers a book to the party, wherein the account is opened, who receives also a quantity of checks.

Different columns are appropriated in the books for the entries of *cash paid*, *cash received*, and *bills deposited* in the bill-office until due, which, when received, are passed forwards to the parties' book.

To pay Cash into the Bank. — Take the cash with the book to one of the tellers, who gives a voucher to the drawing-office, and it will be immediately entered to your credit; and when you have occasion to pay money, draw the sum wanted upon one of the checks, in the following manner:

January 1st. 1818.

To the Cashiers of the Bank of England.
Pay to John Doe, or bearer, One Hundred Pounds.
J. W. & Co.
£100.

When you wish to have your accounts examined, which is termed checking your book, the same is to be left at the Accountant's Office, where all drafts paid are written off the bank-book, and returned cancelled to the drawer.

No money will be paid without such a *check* or *write-off*, which is a printed slip of paper, with a blank for the sum. These

slips are always hung up at a desk in the great hall, and are filled up as follows:

July 25. 1818.

Write off from our bank-book, One Hundred Pounds.
£100.

J. W. & Co.

This being delivered to one of the clerks of the drawing-office, he writes off the sum required, and gives the money, reserving the write-off as a voucher.

When bills are intended to be received, which are payable in London, they should be indorsed and carried with the book to the bill-office, where they are written, or, as is technically termed, *entered short*, and are allowed in the bank-book so left the day after they are paid.

All charges of noting and protesting are paid to the clerks of the bill-office, by whom also all bills dishonoured are returned.

Where you intend that the bank shall pay any of your acceptances, make them payable there; and before they come due, an order must be addressed to the cashiers to pay the same when presented.

The order should contain a short abstract of the bill, specifying the drawer, the payee, the amount, and when due, and be signed by the acceptor, in the same manner as a draft for cash.

No bill can be discounted for less than 100*l.* nor for a longer date than two months.

Bills entered for discount must be sent to the discount office, with a list containing the name of the drawer, the day when due, and the sum subscribed by the persons applying for the discount.

The chief clerk of the discount-office lays the bills before the committee, who either allow or reject them, without assigning any cause: if the bills are approved, the money is immediately paid, by applying at the drawing-office, with a deduction of the discount.

The following may not be unacceptable by way of *vade mecum* to those who are not extremely conversant with the routine of transactions at the bank.

Transfer Days, Period of Dividends, and Hours of Business.

* * India Ann. transf. to 3 per cent. red. at the Bank, Oct. 10. 1793. Interest on India bank due March 31. September 30.

No business transacted on Jan. 1, 6, 18, 25, 30; — Feb. 2, 23, 24; — March 25; — April 8, 11, 12, 25; — May 1, 17, 19, 30; — June 4, 11, 24, 29; — July 25; — Aug. 12, 24; — Sept. 2, 21, 22, 29; — Oct. 18, 25, 26, 28; — Nov. 1, 4, 5, 9, 30. — Dec. 21, 25, 26, 28. Ash-Wed. Good-Fri. East.-Mon. Tues. Whit.-Mon. Tues. Ascen. Day, are Holidays. If Jan. 18, 30; May 29; June 4; Aug. 12; Sept. 2; Nov. 5, 9, fall on Sunday, to be kept on Monday.

A third sort of banking concern consists of the banks of private men, or partnerships, who deal in the same way as the former, upon their own single, or joint, stock or credit.

There is scarcely a town of considerable size throughout the United Kingdom, in which there is not, now at least, *one* such establishment, and in the principal cities, and manufacturing districts, there are *many*. Much has been advanced in favour of, as well as against, these private banks. The most weighty argument against them, is their tendency to enhance the price of provisions, by enabling the agriculturist to keep his commodity out of the market. On the other hand some commerce has been so extended, the aid of these capitalists has become necessary for its support. Much obloquy has been cast on the general system, on account of the great number of failures which took place among the proprietors of these establishments near the conclusion of the last war, and an attempt has been made by the ministers in 1818, if not to give some security for the stability of the respective establishments themselves, at least to prevent their proprietors from obtaining credit on fictitious pretensions to capital, which they might not possess. In the discussion however, which took place in parliament, on the projected measures of precaution, it appeared clearly, that the failures were attributable more to the particular circumstances of the times, than to any radical defect in the system; and also that the evils arising out of the proposed restrictions, would much overbalance the contemplated benefits, and therefore the project was abandoned.

A fourth description of bank has been introduced by stat. 59 Geo. 3. c. 130. viz. "for the safe custody and increase of small savings belonging to the industrious classes of his majesty's subjects," amended by 58 Geo. 3. c. 48.

The statute prescribes the rules for the foundation and government of these institu-

tions, and they are placed under the cognizance of the justices of peace in general, or quarter, session assembled. They are becoming numerous, and promise to be extraordinarily beneficial.

BANKER. A banker may be termed the trustee for a merchant or other person possessed of a large sum of money, which he does not wish to retain in his own hands, but places it, for security, with some banker, from whom he draws it in such sums, and at such times, as his occasions require. The banker's house is termed a bank, or repository of other persons' money.

The profits of banking arise from the interest made, by putting out, upon good security, the surplusage of money, for current demands, and from the difference of exchange between the countries, from, and to, which the banker remits. When they draw for others, all bankers expect a premium, or per centage.

The practice of keeping money with a banker, so universally prevalent in this country, is one of the great causes of its commercial wealth and prosperity: the individual not only saves trouble and risk, but those small sums, which must lie useless in the hands of various individual possessors, constitute, in the hands of the banker, a large aggregate, which the latter can employ advantageously in trade, by discounting for his customers.

In support of the exclusive charter of the Bank of England, it is enacted, that no persons, exceeding six in number, may be united in partnership to borrow, owe, or take up, any sum of money on their bills or notes, payable on demand, or at any time less than six months.

A banker's draft is only taken conditionally, *if paid*, and not otherwise; unless there be an express agreement to take it as cash: but a person in London, who receives such a draft, ought to present it for payment on the day he receives it, if there be a reasonable time for that purpose.

A banker's draft, payable to bearer, and indorsed, is as a bill of exchange against an indorser, and he is equally liable. If a bank-bill or a bank-draft, payable to A. B. or bearer, be delivered to him and lost, and be afterwards found by C. D., A. B. may have an action against C. D., for he has no title to it; though, if the banker pays it, he is indemnified. But if C. D. transfer it to E. F. for a valuable consideration, A. B. cannot maintain an action against E. F., the course of trade creating a property in the assignee.

If a banker's clerk overpay a bill, he is good evidence for his master, in an action to recover back the money so overpaid.

BANKS at Sea, are usually distinguished by a buoy, the colour of which is varied. Sand-banks are denoted by light-coloured buoys, and rocks by black ones.

Banks of the Sea, are protected by divers statutes. Unlawfully and maliciously *breaking them down*, is made felony *sans clergy* by 6 Geo. 2. c. 37. Cutting off, drawing up, or removing any piles, or other things driven into the ground for the protection of sea banks, is made an offence cognizable before justices of the peace, and subject to a penalty of 20*l.* by 10 Geo. 2. c. 32.

And by 15 Geo. 2. c. 33. even cutting down certain shrubs, which are planted on the north west coast of the kingdom for the protection of the sandy banks on the seashore, is subjected to a penalty of 20*s.* to be recovered before justices of the peace, and a second offence subjected to a year's imprisonment, with whipping and hard labour. The repairing and maintaining of sea banks is a duty annexed to the office of a commissioner of sewers. 8 *Term R.* 312.

BANKRUPT, a trader whom insolvent circumstances have forced to commit an act of bankruptcy. The benefit of the bankrupt laws is allowed to none but *actual traders*, or such as buy and sell, and gain a livelihood by so doing.

Description of a bankrupt, within the several statutes, brought together into one view, appears to be as follows:—Every person using the trade of merchandize, by way of bargaining, exchange, barter, chevance, or otherwise in gross, or by retail, or seeking his trade of living by buying and selling, or that shall use the trade or profession of a scrivener, receiving other men's monies or estates into his trust or custody, who shall, (1) depart the realm; or (2) begin to keep his house, or otherwise to absent himself; or (3) take sanctuary; or (4) suffer himself willingly to be arrested for any debt or other thing not grown or due for money delivered, wares sold, or any other just or lawful cause or good consideration or purposes; or (5) shall suffer himself to be outlawed; or (6) yield himself to prison; or (7) willingly or fraudulently shall procure himself to be arrested, or his goods to be attached

or sequestered; or (8) depart from his dwelling-house; or (9) make any fraudulent grant or conveyance of his lands or goods, to the intent or whereby his creditors shall and may be defeated or delayed in the recovery of their just debts; or (10) shall obtain any protection, other than such person as shall be lawfully protected by privilege of parliament; or (11) shall prefer to any court any petition or bill against any of his creditors, thereby endeavouring to enforce them to accept less than their just debts, or to procure time, or longer days of payment than was given at the time of their original contract; or (12) being arrested for debt, shall lie in prison two months; or (13) being arrested for 100*l.* or more, shall escape out of prison,—shall be adjudged a bankrupt; (and in the said cases of arrest, or lying in prison, from the time of his first arrest.) 1 J. c. 15. s. 2.—21 J. c. 19. s. 2. 15.—10 An. c. 15. s. 1.

This description of a bankrupt includes, first, *persons liable to bankruptcy*; and, secondly, *by what acts, or by what conduct, a trader renders himself liable to be made a bankrupt*; or, in other words, what constitutes an act of bankruptcy.

Every person.] An *Irishman*, who trades and hath contracted debts in England, and comes over here, may have a commission issued against him, at the petition of the creditors here; and the Irish creditors also upon the commission may come in and prove their debts. And generally, if a person carries on a trade in any place belonging to the crown of Great Britain, and comes into England, a commission may be taken out by the creditors in England. 1 *Atk.* 82.—5 *Term R.* 530.

A *clergyman*, if he trades, may be a bankrupt. 1 *Atk.* 199.

An *infant*, though a trader, cannot be a bankrupt; for no person can be made a bankrupt for debts which he is not liable at law to pay. 2 *Blackst.* 477.

The daughter of a freeman of London, being a *married woman*, if she trades separately from her husband, may be a bankrupt. 1 *Atk.* 206.

Using the trade of merchandize.] As by exercising the calling of a merchant, a grocer, mercer, or, in one general word, a *chayman*, who is one who buys and sells any thing. 2 *Blackst.* 477.

But one single act of buying and selling will not make a man a trader; but there must be a repeated practice, and profit by it. 2 *Blackst.* 476.

Of merchandize.] But no person who shall adventure any money in the East India company, and shall receive his dividend in merchandize, and shall sell or exchange the same, shall be judged thereby a merchant or trader within any statute for bankrupts. 15 & 14 G. 2. c. 24.

And generally, buying and selling stock

in the public funds, or government securities, will not make a man a bankrupt; the same not being goods, wares, or merchandize, within the intent of the statute, by which a profit may be fairly made. 2 *Blackst.* 476.

So also the members of the corporation of the English *linen company* (for making cambricks and lawns) shall not on that account only be liable to bankruptcy. 4 *G. 3. c. 37.*

Seeking his trade of living by buying and selling.] He who buys only, or sells only, is not within this description; but it must be both buying and selling, and also getting a livelihood by it. 2 *Blackst.* 476.

By special statute of 5 *G. 2. c. 30.* no farmer, *grazier*, or drover of cattle, shall be deemed a bankrupt, s. 40. But if such farmer, or other, shall be a dealer in wool, hops, or the like, he shall be deemed a bankrupt. A farmer, who planted potatoes, but withal bought divers large quantities of potatoes, and sold the same again, was adjudged a bankrupt. *Str.* 513. So a farmer who buys and sells horses to make a profit of them. 1 *Term R.* 573. 11 *East. R.* 274. and 2 *Taunt. R.* 176.

A mere *handicraft occupation*, where nothing is bought and sold, will not make a man a bankrupt; as that of a husbandman, a gardener, &c. who are paid for their work and labour only. 2 *Blackst.* 476.

Nor can an *innkeeper* or *victualler*, as such, be made a bankrupt; for his gain or livelihood doth not arise from buying and selling in the way of merchandize, but greatly from the use of his house, furniture, attendance, and the like; and though he may buy corn and victuals, to sell again at a profit, yet that no more makes him a trader, than a schoolmaster or other person is, who keeps a boarding-house, and makes considerable gains by buying and selling what he spends in the house; and such an one is clearly not within the statutes. *Bl.* 476. yet a *victualler* may. 1 *Ld. Raym.* 287.; as also an innkeeper selling liquors out of his house. 1 *Term R.* 572.

And where persons buy goods, and make them up into saleable commodities, as *shoemakers*, *smiths*, *bakers*, and the like: here, though part of their gain is by bodily labour, and not by buying and selling, yet they are within the statutes of bankrupts; for the labour is only in melioration of the commodity, and rendering it more fit for sale. 2 *Blackst.* 476.

So also, for the like reason, a *butcher* is within the statutes of bankruptcy. *Bur. R.* 2148.

But where a person bought a *coal-mine*, and worked the mine, and sold the coals, he was adjudged not to be within the statutes for bankrupts: but otherwise it would have been, if he had bought the coals and sold the same again. 2 *Wils.* 169.

A person *having a brick ground*, and making bricks for sale, has been held subject to the bankrupt laws, 1 *Term R.* 34.; but a person only making the best of a part of an estate, by burning bricks on such part, and selling them, only enjoys the estate in the most beneficial manner, and is not subject to the bankrupt laws. 7 *East. R.* 442.

A *ship carpenter*, who buys timber, and sells his ships when built, may be a bankrupt; but a mere "working carpenter," who is paid for his labour only, cannot, on that account, be liable to bankruptcy.

By 4 *Geo. 3. c. 33.* members of parliament, who are traders, are made liable to a commission of bankruptcy, if they do not pay or compound with their creditors in the manner that act describes.

A peer of the realm may be a bankrupt, and a commission was once awarded and sued out against the Earl of Suffolk, as a trader in wines. 1 *Atk.* 206.

A *dyer* is also considered as a trader; for he gets his living by buying the drugs, and by selling them in the price which he receives for dyeing. *Cro. Jac.* 585.

But no receiver-general of any taxes granted by act of parliament, shall be deemed a bankrupt. 5 *Geo. 2. c. 30. s. 40.*

By 9 & 10 *W. 3. c. 44.* "No member of the East India Company, in respect of his stock therein only, shall be a bankrupt."

Having a share in a barge or stage coach will not make a man a trader; nor even holding part of a ship and cargo upon a *single adventure*; for persons liable to be bankrupts must be *professed traders*, who get their living by a course of buying and selling, and not persons who merely adventure some particular article in *one* particular voyage. *T. Raym.* 286.

Merely drawing bills on a person's own account, at the expence of paying a quarter per cent. commission, besides interest at five per cent. for their being discounted, and borrowing accommodation notes in exchange for his own to the same amount, will not make a man an object of the bankrupt laws; for this is not an exchange and re-exchange, or drawing and redrawing, within the acts of parliament, and therefore not a *trafficking in exchange*; but a person residing in India, and trading there, drew bills upon England for the value of other bills sent thither, on which he got a profit by the exchange, and during this traffic contracted debts in England, held that he was a trader within the bankrupt laws. 5 *Term Rep.* 530.

Or that shall use the trade or profession of a *scrivener*, receiving other men's monies or estates into his trust or custody.] Bankers, brokers, and factors, are within this description. 5 *G. 2. c. 30. s. 39.*

So also are *pawnbrokers*, being comprehended under the general word *brokers*, which includes the several species of broker-age. 1 *Atk.* 206.

Acts of Bankruptcy.

In general, whenever such "a trader" hath endeavoured to avoid or delay his creditors, or evade their just demands, it hath been declared by the legislature to be an act of bankruptcy, upon which a commission may be sued out.

Depart the realm.] Although the words seem to connect the act of departing the realm with the intention to delay the creditors, yet if a man go abroad not with the intention of delaying his creditors, if by such departure they are in fact delayed or hindered in recovering their just debts, it is an act of bankruptcy. *Bull. N. Pri.* 37.

Any departure from the realm, whereby the creditor must necessarily be delayed and hindered, is an act of bankruptcy. 1 *Taunt. Rep.* 270.

Begin to keep his house, or otherwise absent himself.] If a man keeps his house for a long time, this doth not immediately make him a bankrupt; but if he conceals himself within his house for a day or hour, to delay or defraud his creditors, he is a bankrupt. 1 *Bac. Abr.* 250.

But the denial must be to hinder a creditor; and therefore if a person is denied when sick in bed, or engaged in company, or the denial be made to one who comes on behalf of a creditor, and not to the creditor himself, it is not sufficient; for the denial even to a creditor, is not of itself an act of bankruptcy, but is *prima facie* evidence only of beginning to keep house, and the fact may be explained by circumstances. *Bull. N. P.* 5 *Term Rep.* 570.

A denial to the clerk of the holder of a bill of exchange, or promissory note, is considered as an act of bankruptcy. So to a tax-gatherer. 2 *Taunt. R.* 401.

And an act of bankruptcy once committed cannot be purged by any subsequent circumstances, however strong. 2 *T. R.* 59.

Taking sanctuary.] This mode of committing an act of bankruptcy is now obsolete.

Willingly shall procure himself to be arrested.] If a trader causes a feigned action to be commenced against him, by which any creditor be injured or delayed, it is an act of bankruptcy. *Green*, 36. And

Procuring his goods, money, or chattels to be sequestered, has been said to be a plain and direct endeavour to disappoint his creditors of their security. But he is not a bankrupt if his goods are attached or sequestered without his procurement, as upon an attachment out of a court for his default or laches; as if A. has a rectory impropriate, and the tithes are sequestered for not repairing the chancel. 5 *Com. Dig.* 506.

Shall suffer himself to be outlawed.] It appears to be in this case admitted, that the outlawry must be suffered by the party with intention to defraud or delay his creditors.

Yield himself to prison.] By the yielding

to prison must be intended a voluntary yielding, and not where a man is imprisoned for non-payment of a fine or any refractory behaviour; for although the act which causeth the imprisonment might be voluntary, yet the imprisonment itself is involuntary. But where a man was arrested for thirty pounds, and although he had money sufficient to pay the debt, yet he chose rather to go to prison, in order, as he declared, to force his creditors to come into a composition, this was held to be an act of bankruptcy. *Vin. Ab. tit.* Bankrupt.

Depart from his dwelling-house.] If he depart with a view of defrauding his creditors, or even delaying them, although the absence be but for a single day or hour, it shall be an act of bankruptcy. This departure from his dwelling-house must be voluntary, and not by means of an arrest; nor will the absconding, to avoid any process, make a man a bankrupt, unless the foundation of the process is the non-payment of money. 1 *Atk.* 196. 7 *Term R.* 509.

Make any fraudulent grant or conveyance of his lands or goods, &c.] A fraudulent grant, to come within the meaning of this statute, must be by deed; and therefore a fraudulent sale of goods not by deed, is no act of bankruptcy, though the sale, if made in contemplation of bankruptcy, is void. *Cooke's B. L.* 86. 4 *Burr.* 2478.

The system of the bankrupt laws is, that the bankrupt's estate shall be divided equally among all his creditors; and therefore, where a trader conveys his whole estate to one or more creditors, in exclusion of one or more, the law construes such a deed to be fraudulent as against them, and makes the attempt, *ipso facto*, an act of bankruptcy. 2 *Burr.* 829. 831. 7 *East. R.* 137.

Obtain any protection, other than such person who shall be lawfully protected by privilege of parliament.] By the 4 G. 3. c. 33. in respect to persons having privilege of parliament, it is enacted, that the petitioners, on affidavit in any of his majesty's courts of record at Westminster, that the debt is justly due, and that they verily believe that the debtor is a merchant, banker, broker, factor, scrivener, or trader, within the statutes of bankruptcy, may sue out a summons, or an original bill and summons, against such person, and serve him with a copy thereof; and if he shall not, within two months after personal service of such summons, pay, secure, or compound for such debt, or enter into a bond in such sum, and with two such sureties as any of the judges of that court out of which the summons issued, shall approve of, to pay such sum as shall be recovered in such action, together with such costs as shall be given in the same, he shall be adjudged a bankrupt from the time of the service of such summons, and the creditors may pro-

ceed against him as against other bankrupts. Provided that nothing herein shall subject any person entitled to privilege of parliament to be arrested or imprisoned during the time of such privilege, except in cases made felony by any of the statutes of bankruptcy.

Being arrested for debt, shall be in prison two months.] The inability of a trader to find bail in order to obtain his liberty, argues a strong deficiency of his credit; and his neglect to do it, if able, can arise only from a fraudulent intention; in either case it is high time for his creditors to compel a distribution of his effects. 2 Burr. 819.

The act of bankruptcy relates back to the time of arrest, so as to vest the property in the assignees from that time. 2 Term R. 141. And the day of arrest is to be reckoned the first of the two months. 3 East. R. 407.

Of Contracts and Dealings, previous to the Date of the Commission.

But in all cases of commissions of bankruptcy hereafter to be issued, all conveyances, and all payments by and to, and all contracts and other dealings and transactions by and with any bankrupt, *bonâ fide* made or entered into more than two calendar months before the date of such commission, shall, notwithstanding any prior act of bankruptcy committed by such bankrupt, be good and effectual to all intents and purposes whatsoever, in like manner as if no such prior act of bankruptcy had been committed; provided the person or persons so dealing with such bankrupt had not, at the time of such conveyance, payment, contract, dealing or transaction, any notice of any prior act of bankruptcy by such bankrupt committed, or that he was insolvent, or had stopped payment. 46 G. 3. c. 135. s. 1.

And no commission of bankrupt hereafter shall be avoided or defeated by reason of any act of bankruptcy having been committed by the person or any of the persons against whom such commission shall have issued, prior to the contracting of the debt of any of the creditors upon whose petition such commission shall have issued, if such petitioning creditor had not any notice of such act of bankruptcy, at the time when the debt to him was contracted; but that such commission of bankrupt, and all the proceedings under the same, shall be valid and effectual to all intents and purposes, notwithstanding that such prior act or acts of bankruptcy shall have been committed by such bankrupt.

And all persons with whom the bankrupt shall have really and *bonâ fide* contracted any debt or debts before the date and issuing forth of such commission, (which if contracted before any act of bankruptcy committed, might have been

proved under such commission,) shall, notwithstanding any prior act of bankruptcy may have been committed by the bankrupt, be admitted to prove such debt or debts, and to stand and be a creditor under such commission to all intents and purposes whatever, in like manner as if no such prior act of bankruptcy had been committed by such bankrupt; provided such creditor or creditors had not, at the time of such debt or debts being contracted, any notice of any prior act of bankruptcy by such bankrupt committed. Sect. 2.

Of the Commission, striking a Docket, &c.

No commission of bankruptcy can issue after a man's death; and although it be granted in his life-time, yet, if nothing be done upon it before he dies, all is avoided; but when it has issued, and the commissioners have proceeded to declare the party a bankrupt, his death will not prevent the further execution of the commission. 2 Ch. Cas. 143. 192.

On a joint commission against two bankrupts, they must be *each* found bankrupt; and though one of them die, the commission may still go on; but if one of the joint traders be dead at the time of taking out the commission, it abates, and is absolutely void. 1 Atk. 97. 1 Bac. Ab. 251.

A separate commission may issue against one of three or more partners for a joint debt, though an action cannot be maintained against one partner without joining the others. 1 Atk. 133.

When a joint commission is granted, all the partners must be severally declared bankrupt.

A debt contracted before a man enters into trade, may be the ground of a petition for a commission of bankruptcy. Dougl. 295.

A creditor who has taken his debtor's body in execution, cannot afterwards sue out a commission against him on the debt for which he has taken him in execution. Strange, 653.

When, after notice of bankruptcy, a creditor receives a part of his debt, as such money is liable to be refunded to the future assignees, the original demand remains as before, and will support a commission.

A creditor by promissory note may sue out a commission, though the note be above six years standing; for the statute of limitations, by which an action on it might be barred at law, does not extinguish the debt, but only removes the remedy.

A separate commission against one partner may be taken out on a debt due from the partnership. 1 Atk. 341.

A commission is granted upon petition to the lord chancellor.

But no commission of bankrupt shall be issued on the petition of one or more creditors, unless the single debt of such cre-

ditor, or of two or more being partners, amount to 100*l.*; or of two such creditors petitioning, amount to 150*l.* or of three or more creditors, amount to 200*l.* 5 Geo. 2. c. 30. s. 25.

The petitioning creditor must have a *legal* and not an *equitable* demand, to the amount thus specified against the bankrupt, to be enabled to sue out a commission. 1 *Atk.* 147. 2 *Vesey*, 407.

The creditor or creditors petitioning, shall, before the commission shall be granted, make affidavit before a master in chancery (to be filed with the proper officer) of the truth of the debt, and shall also give 200*l.* bond to the lord chancellor for proving the debt, as well before the commissioners, as upon a trial at law, if the due issuing of the commission shall be contested, and also for proving the party a bankrupt, and farther to proceed on such commission, as hereafter is mentioned; and *if it shall appear that the commission was taken out fraudulently, the lord chancellor may order satisfaction, and may assign such bond to the party injured.* 5 Geo. 2. c. 30. s. 23.

This is technically termed *striking a docket*, upon which the chancellor is bound to issue a commission, not as matter of discretion or favour, but of right.

Unless, however, the party seal the commission within *four* days, exclusive of the day of striking the docket, and prosecute such commission within *fourteen* days, if to be executed in London; or *twenty-eight* days, if to be executed in the country; another petition may be opened by any other competent creditor.

If the bankrupt reside either in the metropolis or *within forty miles* of it, the commission must be executed in town. [If exceeding these limits, and where none of the ordinary commissioners reside, a list of commissioners' names must be sent to the bankrupt-office. This list should consist of *three solicitors*, and of *two barristers*, as the quorum commissioners.]

And the lord chancellor will, by commission under the great seal, appoint such wise, honest, and discreet persons as to him shall seem good, to be commissioners. 13 *Eliz.* c. 7. s. 2.

Which commissioners, before they act, shall administer to each other the following oath: "I, *A. B.* do swear, that I will faithfully, impartially, and honestly, according to the best of my skill and knowledge, execute the several powers and trusts reposed in me as a commissioner in a commission of bankrupt against —, and that without favour or affection, prejudice or malice. So help me God." 5 Geo. 2. c. 30. s. 43.

Then the commissioners shall cause notice of the commission being issued to be given in the Gazette, and likewise notice in

writing to be left at the bankrupt's usual place of abode, or personal notice to be given, if he is in prison. 5 Geo. 2. c. 30. s. 1.

In which notice also shall be appointed a time and place of meeting of the commissioners; which meeting shall be at three several times within forty-two days, the last of which shall be on the forty-second day; within which time the bankrupt shall surrender himself, and discover his estate and effects. 5 Geo. 2. c. 30. s. 1, 2.

But the lord chancellor may enlarge the time for such surrender and discovery, not exceeding fifty days from the end of the said forty-two days; so as such order be made by him, six days before the expiration of the forty-two. *Id.* s. 3.

A creditor may choose whether he will come in under the commission or not; but if he chooses to come in, he cannot proceed at law likewise for the same debt. Therefore if a creditor has a bankrupt in execution, he must discharge him from the execution, before he can be admitted as a creditor under the commission. And a petitioning creditor, by the very petition, hath made his election. 1 *Atk.* 83. 152.

Proving a debt under a commission to be an election not to proceed against the bankrupt by action in respect of such debts. 49 Geo. 5. c. 121. s. 14.

The commission shall not abate by the death of the king. 5 Geo. 2. c. 30. s. 45.

Choice of Assignees, Disposal of Money, and Proof of Debts.

The first meeting after the commissioners are appointed, shall be for choosing the assignee or assignees of the bankrupt's estate and effects (which, in London, shall be at *Guildhall*). 5 Geo. 2. c. 30.

And the commissioners may, from time to time, appoint new assignees, if the major part of the creditors, whose debts amount to 10*l.* shall think fit; and the former assignees shall assign to them, in ten days after notice of such choice, and of the new assignees' acceptance thereof, signified under their hands; on pain of 200*l.* to the creditors, with full costs. 5 Geo. 2. c. 30. s. 50.

As the statute directs that the choice of assignees shall be by the major part of the creditors *in value*, one creditor, if his claim be sufficiently large, may choose himself assignee.

And the creditor or creditors who shall sue out the commission, shall prosecute the same at their own expence till assignees be chosen; and the commissioners shall, at the meeting for choosing assignees, ascertain such costs, and by writing under their hands, order the assignees to reimburse the same, out of the first effects that shall be got in. 5 Geo. 2. c. 30.

But before assignees are chosen, the

major part in value of the creditors may direct how and with whom the money to be received shall remain till divided: to which the assignees shall conform, as often as 100%. shall be got in. 5 Geo. c. 30.

By 49 Geo. 3. c. 121. s. 3. — If the creditors do not direct how the money arising from the bankrupt's estate shall be paid in, the commissioners shall give directions, to which rule and direction the assignee or assignees of the bankrupt's estate shall conform, as often as 100%. shall be got in and received from such bankrupt's estate, and are hereby indemnified for what they shall do in pursuance of such direction of the said commissioners as aforesaid; provided that it shall not be lawful for the commissioners to direct such monies to be paid into the hands of the said commissioners, or any of them, or of the solicitor to the commissioners, or into any banking-house, or other house of trade or business, in which the commissioners, or any of them, or the solicitor to the commission, are or is interested or concerned as a partner or partners, or otherwise.

Assignees disobeying such directions, to be charged 20 per cent. on the money retained or employed contrary thereto. Sect. 4.

Commissioners may direct the money paid in on a bankrupt's effects to be invested in exchequer bills, for the benefit of the creditors. Sect. 7.

At the said meeting for choosing assignees, the commissioners shall admit the proof of any creditor's debt who lives remote from the place of meeting by affidavit; and also permit any person duly authorised by letter of attorney from such creditors (oath being first made of the due execution thereof, either by affidavit sworn before a master in chancery, or before the commissioners *viva voce*; and in case of creditors residing in foreign parts, such affidavits to be made before a magistrate where the party shall be residing, and together with such creditor's letters of attorney, to be attested by a notary public) to vote in the choice of an assignee or assignees, in the place of such creditor: And every creditor shall be admitted to prove his debt, without paying any thing for the same. And the commissioners shall assign the estate and effects unto such person or persons as the major part in value of the creditors, according to the debts then proved, shall choose. 5 Geo. 2. c. 30. s. 25, 26. — But no creditor shall so vote, whose debt shall not amount to 10%. Ibid. s. 27.

The common proof required, is the oath of the creditors.

The positive oath of the book-keeper of a merchant or trader is allowed to be sufficient to hold his master's debtor to bail, and therefore his deposition in case of bankruptcy, ought to be admitted by the com-

missioners as proof of the debt due to his master; but his oath must be positive, both by 12 G. 1. c. 29., perpetuated by 21 G. 2. c. 3., and by the established rule of the court.

If any person shall swear that any sum is due to him from the bankrupt, which is not due, or more than is due, he shall suffer as in cases of perjury, and moreover forfeit double to the creditors. 5 Geo. 2. c. 30.

Debts not payable at the time of the bankruptcy may be proved, deducting a rebate of interest. 49 Geo. 3. c. 121.

Claims of particular Creditors, including Liens on a Bankrupt's Goods, &c.

Actions.—A person having a cause of action only, is not a creditor capable of proving a debt under the commission; but if he has commenced his suit, and obtained judgment before the act of bankruptcy, it then becomes a legal debt, and may be proved. *Cro. Car.* 166.

Agreement for the purchase of goods, to be paid for at a future day; and before the day of payment arrived, the trader became a bankrupt; held, that this was not a debt proveable under his commission, because the goods were not delivered, nor was the contract signed with the party, and therefore not within the statute 7 Geo. 1. c. 31. respecting debts payable at a future day. 2 *Peere Williams*, 396.

Annuity creditors may be admitted to prove the value under any commission. 49 Geo. 3. c. 121. s. 17.

Apprentices are entitled to be admitted creditors under master's commission for so much of the apprenticeship fee as shall appear to remain after deducting for the time served. The most equitable method is to allow the apprentice a gross sum out of the bankrupt's effects; and commissioners have of late years recommended it to creditors to allow it.

Assets are not affected by the bankruptcy of an executor; and the creditors and legatees of the testator need not come in under the commission, unless where the executor has wasted or misapplied the assets.

Attorney.—An attorney has a general lien upon all papers delivered to him. 4 *Taunt. R.* 807.

Children.—A child living with the father, and earning money for itself, may, if the father receive the money, be admitted a creditor under the commission. 2 *Vesey*, 6751.

Executions and attachments against the lands and tenements, or goods and chattels of the bankrupt, *bonâ fide* executed or levied more than two calendar months before the date and issuing of such commission, shall be valid and effectual, notwithstanding any prior act of bankruptcy committed by such bankrupt, in like manner as if no such prior act of bankruptcy had been committed;

provided the person, at whose suit such execution or attachment shall have issued, had not, at the time of executing or levying the same, any notice of any prior act of bankruptcy by such bankrupt committed, or that he was insolvent or had stopped payment: provided always, that the issuing of a commission of bankrupt, although such commission shall afterwards be superseded, shall be deemed such notice, if it should appear that an act of bankruptcy had been actually committed at the time of issuing such commission. 49 Geo. 3. c. 121.

Exhibits. If a creditor has any security for his debt, as a bond, note of hand, bill of exchange, &c. he must produce them to the commissioners, who are to endorse or underwrite them as *exhibited* under the commission.

If a creditor has a lien on the bankrupt's estate, as a mortgage, pledge, execution, bill of sale, &c. he is not obliged to part with them till he is satisfied for his debt, as far as such liens will extend; and if, after such satisfaction, any part of his debt remains unpaid, he may come under the commission for the residue.

Factor.—A factor has a lien upon goods consigned to him by a bankrupt, whilst they remain in his possession, for items of a general account with the bankrupt; and therefore such factor is only a creditor for the balance of his account. 2 Burr. 397.

Bills remitted to a factor, while unpaid, are in the nature of goods unsold, and are subject to such lien as the factor may have thereon. 2 Bl. Rep. 1155.

A factor, who is surety in a bond for his principal, has a lien on the price of the goods sold by him for his principal, to the amount of the sum he is bound for. *Cowp.* 251.

Friendly Societies.—Persons entrusted with property belonging to such societies, dying, or becoming bankrupt or insolvent, their executors, administrators, or assignees, shall, within 40 days after demand made by such society, deliver up to such persons as shall be by them appointed, every thing belonging to such society; and pay out of the effects of such persons, all sums of money remaining due, and received by virtue of such office, before any of the other debts are paid or satisfied. 55 Geo. 3. c. 54. s. 10.

Joint Trader.—Creditors of a joint estate, where there are no separate creditors, may exhaust both the joint and separate estate; but where there are both the joint and separate creditors, the joint creditors (as they give credit to the joint estate) shall have first their demand on the joint estate; and separate creditors (as they give credit to the separate estate) shall have first their demand on the separate estate. But if there be a surplus of the separate estate, the joint creditors are entitled to it; for a bankrupt

has no right to any thing till they are fully satisfied. 1 Atk. 67. 138. 227.

Landlord.—A landlord may distrain goods while they remain on the premises, for his entire rent, be the arrears what they may, notwithstanding the assignment by the commissioners; but if he suffer them to be sold by the assignees, he has lost his remedy by distress, and can only come in with the rest of the creditors. 1 Atk. 102. 104.

Marriage Articles.—If a husband, by articles previous to marriage, covenants to leave his wife a certain sum of money, in case she survives him, and he becomes a bankrupt, and dies before any dividend is made, the wife cannot be admitted as a creditor under the commission, for it was not a debt due before the bankruptcy; but if the covenant had been to pay the money to trustees for her use, in his life-time, the court would admit the trustees to prove it, for it was a debt due in his life-time, and before the bankruptcy. 1 Atk. 115, 116.

Mortgagee.—A mortgagee of land may choose whether he will come in as a creditor under the commission; for having a real security in his hands, he is safe, and the assignees have only the equity of redemption; but if he prove his debt, he must relinquish his security. 1 Atk. 105. 162.

Packer.—A packer may retain goods till he is paid the price of packing; and if he has another debt due to him from the same person, the goods shall not be taken from him till he is paid the whole, notwithstanding the debtor is become a bankrupt. Atk. 228.

Policies of Insurances.—All and every person or persons who have effected or shall effect any policy or policies of insurance, upon ships, goods, wares, merchandize or other effects, with any person, as a subscriber or underwriter, who is or are, or shall become a bankrupt, shall be admitted to prove any loss to which such bankrupt is or shall be liable in respect of his subscription to such policy or policies, notwithstanding the person or persons effecting such policy or policies is not or are not the person or persons beneficially interested in such ships, goods, wares, merchandize, or other effects; provided the person really interested is not in that part of the united kingdom in which the commission of bankrupt shall have issued in the proceedings under which such loss is to be proved. 49 Geo. 3. c. 121.

Respondentia.—The obligee in any bottomree or respondentia bond shall be admitted to claim; and after the loss or contingency has happened, may prove his debt. 19 Geo. 2. c. 32.

Securities.—Persons taking securities, payable at a future day, for goods delivered to persons who shall become bankrupts before the time of payment, shall be admitted to prove their securities, and receive their

proportion, deducting interest from the time of payment to the time it would have become due. 7 Geo. 1. c. 31.

Servants.—The commissioners, in the case of menial servants, always recommend the creditors to direct the assignees to pay them their full wages; and Lord Chancellor Cowper expressed an opinion, that it was unreasonable that servants should come in with the rest of the creditors; but this depends entirely upon the generosity of the creditors; for unless they consent, servants have no remedy by law to recover their full money. *Green*, 134.

Sureties.—In all cases of commissions of bankrupts hereafter to be issued, where, at the time of issuing the commission, any person shall be surety for, or be liable for any debt of the bankrupt, it shall be lawful for such surety, or person liable, if he shall have paid the debt, or any part thereof in discharge of the whole debt, although he may have paid the same after the commission shall have issued, and the creditor shall have proved his debt under the commission, to stand in the place of the creditor as to the dividends upon such proof; and when the creditor shall not have proved under the commission, it shall be lawful for such surety, or person liable to prove his demand in respect of such payment as a debt under the commission, not disturbing the former dividends, and to receive a dividend or dividends proportionably with the other creditors taking the benefit of such commission, notwithstanding such person may have become surety or liable for the debt of the bankrupt after an act of bankruptcy had been committed by such bankrupt; provided that such person had not, at the time when he became such surety, or when he so became liable for the debt of such bankrupt, notice of any act of bankruptcy by such bankrupt committed, or that he was insolvent, or had stopped payment: provided always, that the issuing a commission of bankrupt, although such commission shall afterwards be superseded, shall be deemed such notice. 49 Geo. 3. c. 121.

This act does not extend to Scotland.

Bankrupt not surrendering.

On certificate under the hands and seals of the commissioners, that such commission is issued, and such person proved before them to become bankrupt, any judge or justice of the peace, shall, on application to them for that purpose made, grant their warrant for taking and apprehending such person, and commit him to the common gaol, there to remain until he be removed by order of the commissioners by their warrant. And the gaoler shall forthwith give notice to one or more of the commissioners, of such person being in his custody; whereupon they shall send their warrant to him to deliver him to the person who shall be named in the warrant,

who shall convey him to the commissioners to be examined. And the commissioners, by such or any other their warrant, may seize the goods and papers of such bankrupt which shall be in any prison (necessary wearing apparel of himself, and wife and children excepted). 5 Geo. 2. c. 30.

But if the person so apprehended shall, within the time allowed, submit to be examined, and in all things conform, he shall have the same benefit as if he had surrendered. 5 Geo. 2. c. 30.

By which last clause it appears, that the bankrupt shall not be apprehended and committed, until he shall have made default in not surrendering and making discovery, after due notice as aforesaid.

If the bankrupt does not surrender himself to the commissioners by twelve o'clock at night, of the day appointed for the third public meeting, the messenger warns him so to do, on pain of death, by proclamation made in Guildhall. This, however, seldom occurs.

Surrender of Bankrupt, &c.

If not actually in custody, the bankrupt, in prudence, should attend the first meeting of the commissioners, to apply for a protection.

The bankrupt, after assignees shall be appointed, shall deliver up to them, on oath (to be administered by a master in chancery, or justice of the peace) all his books of accounts, papers, and writings not seized by the messenger of the commission, and not before delivered up, and then in his power, and discover such as are in the power of others; and being not in custody, shall at all times attend the assignees, on reasonable notice given to him in writing, or left for him at his place of abode, in order to assist in making out the account of his estate. 5 G. 2. c. 30.

And such bankrupt having surrendered, shall, at all seasonable times, before the expiration of 42 days or further term, be at liberty to inspect his papers, in presence of the assignees, or some person appointed by them, and to bring with him, for his assistance, any persons, not exceeding two at a time, and to make extracts from thence, the better to enable him to discover his effects. 5 Geo. 2. c. 20.

And in order thereto, he shall be free from arrest or imprisonment by his creditors, in coming to surrender, and from his surrender, for the said 42 days or further term; provided he was not in custody at the time of surrender. And if he be arrested for debt, or on an escape warrant, coming to surrender, or after surrender within the said term; then, on producing the notice under the hands of the commissioners or assignees, to the officer who shall arrest him, and making it appear to such officer that such notice is signed by them, and giving the officer a copy thereof, he shall be immediately discharged. And if any officer

shall in such case detain him, he shall forfeit to him, for his own use, 5*l.* a day by action of debt, with full costs. *Id.*

And if the bankrupt be in prison or custody at the time of issuing the commission, and is willing to surrender and be examined, and can be brought before the commissioners and creditors, the expence thereof shall be paid out of his estate. 5 Geo. 2. c. 30.

And every bankrupt, being in custody at the time of his or her last examination, although charged in execution, shall be brought before the commissioners to be examined by them, in the same manner as is now practised with respect to bankrupts in custody on mesne process; and the gaoler shall be fully indemnified by the warrant of the commissioners for bringing up such bankrupt. 49 Geo. 3. c. 121.

And the commissioners may examine him on oath (21 J. c. 19.), *as well by word of mouth, as on interrogatories in writing, touching his trade, dealings, estate, and effects; and take down in writing his answers to verbal examinations; which he shall sign; and if he shall refuse to answer, or not answer fully, all lawful questions, or refuse to sign the same; the commissioners may, by warrant, commit him to prison without bail, till he shall submit to them, and full answer make, and sign the same; which warrant shall specify such questions.* 5 G. 2. c. 30.

But if on an *habeas corpus* there appear insufficiency in the warrant of commitment, the judge nevertheless shall commit him to the same prison, to remain as aforesaid, unless it be made appear that he hath fully answered all lawful questions, or unless it appear that he had sufficient reason for not signing. 5 Geo. 2. c. 30.

And if he shall not, within the said time, surrender himself to the commissioners, and sign such surrender, and also submit to be examined from time to time on oath, and in all things conform to the statutes concerning bankrupts, and also on his examination fully discover all his estate, and how disposed of, except what hath been *bonâ fide* disposed of in the way of his trade and dealings, and except what hath been laid out in the ordinary expence of his family, and also deliver up to them all his effects (except the necessary wearing apparel of himself, and wife and children); then, in case of any default and wilful omission in not surrendering and submitting to be examined, or in case he shall remove, conceal, or embezzle any part of his estate to the value of 20*l.* or any books of account, or writings relating thereto, with intent to defraud his creditors and be there-of convicted by indictment or information, he shall be guilty of felony without benefit of clergy, and his estate shall be divided among his creditors. 5 Geo. 2. c. 30.

And every person who shall accept any trust, or conceal any estate of the bankrupt,

and shall not, in 42 days after issuing the commission, and notice thereof in the Gazette, discover the same in writing to one or more commissioners or assignees, and submit himself to be examined; shall forfeit to the creditors 100*l.* and double the value of the estate concealed, by action of debt, with full costs. 5 Geo. 2. c. 30.

Of superseding the Commission, &c.—If a bankrupt is able to satisfy the demands of his creditors, the commission may be superseded.

Petitioning creditor may agree to supersede the commission; but the other creditors may renew it, and revoke the supersedeas.

A commission may also be superseded if the party is not found to be a trader, or if the commission was not issued in due time, &c.

And if any bankrupt, after issuing the commission, shall compound with the person suing out the same, for more than his proportion with the rest of the creditors, such commission may be superseded; and the lord chancellor may award to any creditor petitioning, another commission, and the person so compounding shall lose his whole debt, and deliver up to the new commissioners all he shall have so received, for the use of the other creditors. 5 G. 2. c. 30.

Powers of Commissioners and Assignees.—The commissioners may examine, on oath, the bankrupt's wife, like as any other person. 21 J. c. 12.

As also every other person duly summoned before, or present at their meeting, touching the person, trade, dealings, estate, and effects of the bankrupt, and any acts of bankruptcy by him committed; and may take down in writing the answers to verbal examinations, which the party shall sign; and if any of them shall refuse to answer, or not answer fully, all lawful questions, or refuse to sign the same, the commissioners may, by warrant, commit him to prison without bail, till he shall submit. 5 Geo. 2. c. 30.

Commissioners and others, by warrant under their hands and seals, may break open the bankrupt's houses, doors, trunks, and chests, where he or any of his goods are reputed to be, and seize upon and order his body and goods as before is said. 21 J. c. 19.

And shall have power, by their discretions, to take such order with the lands of such bankrupt, which he had in his own right before he became a bankrupt, or which he purchased jointly with his wife or child to the only use of such bankrupt, or for such use or interest, as he may lawfully part with; or with any person of trust to any secret use of such bankrupt; and also with all his money, goods, chattels, wares, merchandizes, and debts; and cause all the same to be sold by deed indented, and enrolled in a court of record; or otherwise

ordered for payment of the creditors. And if any lands or goods shall descend or come to the bankrupt afterwards, before the debts be fully paid, the same shall be disposed of in like manner. 13 El. c. 7.

But this shall not extend to lands assured by such person before he becomes bankrupt, provided the assurance be made *bonâ fide*, and not to his own use only, or of his heirs; and that the party to whose use they are assured, be not privy to the fraudulent purpose of the bankrupt to deceive his creditors. Sect. 12.

Also the commissioners may, by deed indented, and enrolled at *Westminster*, in six months, sell the bankrupt's estate in tail, whereof no reversion or remainder is in the king or of the king's gift; which sale shall be good against all persons whom the bankrupt, by common recovery, or otherwise, might cut off.

Also, if the bankrupt hath conveyed any estate, on condition, or power of redemption at a day to come, by payment of money, or otherwise; the commissioners, before the time of the performance of such condition, may appoint, under their hands and seals, any person to make tender or payment of money or other performance, as fully as the bankrupt might have done; and may dispose of the estate redeemed for the use of the creditors, as fully as any other estate of the bankrupt. 21 J. c. 19.

Effects which a bankrupt hath as executor only, shall not be applied to the use of the creditors; but shall go according to direction. 1 Atk. 101. So as a bailee only. 3 Term R. 516. So as a factor or banker for a specific purpose. 5 Term R. 215. 2 H. Black. R. 501. So as an overseer of a parish for the poor. 1 Term. R. 370.

If the bankrupt shall convey to any of his children, or other person, any lands or goods, or transfer his debts in other men's names, except the same be conveyed or transferred on marriage of any of his children, or for some valuable consideration; the same may be seized and disposed of. 1 J. c. 15.

Also the assignees, with consent of the major part in value of the creditors, present at a meeting pursuant to notice to be given in the Gazette, may submit disputes relating to the bankrupt's estate to arbitration; and may compound for debts owing to the bankrupt. 5 Geo. 2. c. 50.

Every person who shall, after the time of surrender, voluntarily make discovery to the commissioners or assignees, of any part of the bankrupt's estate, not before come to the knowledge of the assignees, shall have 5*l.* per cent. and such farther reward as the assignees and the major part of the creditors in value, present at any meeting, shall think fit. 5 Geo. 2. c. 30.

Where debts carry interest, the same shall be continued down to the date of the commission: but note-creditors have no right to

prove interest upon them, unless it is expressed in the body of the notes. Even at law, where notes are for value received, and interest is not expressed, the jury do not give the plaintiff in an action upon the notes, interest for them, but by way of damages only; and commissioners of bankrupts cannot award damages. 1 Atk. 151. 259.

Assignees shall not be answerable for losses occasioned by their own necessary acts; but if an assignee trusts a person with the payment of money who fails, and the money is lost, such assignee shall be answerable over to the creditors, unless he consulted the body of the creditors in the appointment of such agent. 1 Atk. 87.

An assignee, who is an officer of the court, and an officer of the commission, shall not be allowed to stop a person's share in the dividend on account of his own private debt, which is owing to him from that person; he hath his remedy at law, and ought not to intermix his own private affairs with the commission, to which he is only a trustee. 1 Atk. 90.

The assignees shall keep books of accounts of all sums and effects received: which every creditor, who hath proved his debt, may inspect at all seasonable times. 5 Geo. 2. c. 30.

To prevent expences, no money shall be paid out of the effects for eating and drinking of the commissioners, or of any other person, nor shall the commissioners have above 20*s.* each, for each meeting; nor any schedule be annexed to the deed of assignment. Commissioners acting contrary hereto, shall be disabled for ever to act as such. 5 Geo. 2. c. 50.

In actions brought by assignees, the commission and proceedings under it to be sufficient evidence of the petitioning creditor's debt, and the trading and act of bankruptcy, unless notice be given that those matters are to be disputed. 49 Geo. 3. c. 121. The same in suits in equity by assignees as against all other parties to the suit. *Id.*

No suit in equity shall be commenced by the assignees, without consent of the major part in value of the creditors, who shall be present at a meeting of the creditors, pursuant to notice in the Gazette. 5 Geo. 2. c. 30.

But the assignees may bring actions at law without first calling a meeting of creditors; and they shall have the same remedy for recovery of debts due to the bankrupt, as the bankrupt himself could have had; and therefore they may have debt upon bond or contract made to the bankrupt, or an action upon the case upon *assumpsit*. 3 Salk. 59.

By 46 Geo. 3. c. 155. it is enacted, that in all cases in which, under commissions of bankrupt hereafter to be issued, it shall appear that there has been mutual credit given by the bankrupt and any other person, or mutual debts between the bankrupt

and any other person, one debt or demand may be set off against another notwithstanding any prior act of bankruptcy committed by such bankrupt before the credit was given to, or the debt was contracted by such bankrupt, in like manner as if no prior act of bankruptcy had been committed, provided such credit was given to the bankrupt two calendar months before the date and suing forth of such commission, and provided the person claiming the benefit of such set-off had not, at the time of giving such credit, any notice of any prior act of bankruptcy by such bankrupt committed, or that he was insolvent, or had stopped payment.

No action to be brought against assignees for dividends, but the remedy to be by petition to the chancellor, who may order payment with interest and costs. 49 Geo. 3. c. 121.

And in case any commission of bankrupt shall issue against any person who is or shall be an assignee of the estate and effects of any bankrupt, and who shall, at the time of such commission issuing against him, be indebted to the estate of the bankrupt, of whose estate and effects he was an assignee, to the amount of 100*l.* or upwards, in respect of money come to his hands as such assignee, and wilfully retained or employed by him for his own benefit, the certificate of conformity which may be obtained by such assignee so becoming bankrupt as aforesaid, shall only have the effect of freeing the person of such bankrupt from arrest and imprisonment; but the future estate and effects of every such person shall remain liable for so much of his debt to the estate of the bankrupt of whose estate and effects he was an assignee, as shall not be paid by dividends under the said commission, together with lawful interest for the whole debt, in like manner as if he had not obtained his certificate; the tools of trade, the necessary household goods and furniture, and necessary wearing apparel of such bankrupt, and his wife and children, only excepted.

Dividends.—Commissioners are not to declare a dividend till a true statement, in writing, be made upon oath by the assignees; and the commissioners shall examine such statement, “and shall enquire for what reason any sum appearing to be in the hands of such assignees ought to be retained, and thereupon shall declare a dividend on the remaining sum, specifying in their order the sum so allowed to be retained, and the grounds on which they may conceive it proper that the same should be retained, and not divided amongst the creditors.” 49 G. 3. c. 121.

The assignees shall, after four and within twelve months, after issuing the commission, cause at least twenty-one days’ notice to be given in the Gazette, of the time and place the commissioners and assignees intend to

meet to make a dividend; at which time, the creditors who have not before proved their debts, may prove them; and the assignees shall produce fair accounts, and be sworn to them before the commissioners, if required by the creditors; and they shall be allowed therein all reasonable expences. And the commissioners may then order, under their hands, a distribution (to every creditor a portion ratelike, according to the quantity of his debts. 13 Eliz. c. 7.); which order shall contain the time and place of making it, and the total of the debts proved, and of the money in the hands of the assignees, and how much in the pound shall be then distributed; one part of which order shall be filed among the proceedings under the commission, and each of the assignees shall have a duplicate thereof. And the assignees shall take receipts for the same, in a book to be kept for that purpose. 5 Geo. 2. c. 30.

In eighteen months after issuing the commission, the assignees shall make a second dividend, and shall cause notice to be inserted in the Gazette of the time and place the commissioners intend to meet to make a second distribution, and for the creditors who have not proved their debts, to come and prove them. And at such meeting, the assignees shall produce their account on oath; and what is in their hands, shall, by order of the commissioners be forthwith divided. Which second dividend shall be final, unless a suit in law or equity be depending, or part of the estate standing out that cannot have been disposed of, or that the major part of the creditors shall not have agreed to be sold, or unless some other or future estate of the bankrupt shall come to the assignees; which they shall, as soon as may be, convert into money, and in two months distribute the same in like manner. 5 Geo. 2. c. 30.

Allowance to Bankrupt.—The bankrupt, surrendering and conforming, shall be allowed 5*l.* per cent. if, after such allowance, the neat produce of his estate will pay 10*s.* in the pound; so, as the said 5*l.* per cent. amount not to above 200*l.*

And if the neat produce of his estate will pay 12*s.* 6*d.* in the pound, he shall be allowed 7*l.* 10*s.* per cent. so as it amount not to above 250*l.*

And if it will pay 15*s.* in the pound, he shall be allowed 10*l.* per cent. so as it exceed not 300*l.*

If the neat produce will not pay 10*s.* in the pound, the bankrupt shall be allowed so much as the assignees and commissioners shall think fit, not exceeding 5*l.* per cent. 5 Geo. 2. c. 30.

But the same shall not be paid to the bankrupt till a final dividend shall be made; because, until that time, creditors may still come in to prove their debts. 1 Atk. 208.

Certificate.—No discovery on oath shall

entitle the bankrupt to the said allowance, unless the commissioners shall, under their hands and seals, certify to the lord chancellor, that he hath made a full discovery of his estate, and in all things conformed himself; and that there doth not appear to them any reason to doubt the truth of such discovery, or that the same is not a full discovery; and unless three parts in five in number and value of the creditors, who shall be creditors for not less than 20*l*. and who have proved their debts, or some person by them authorised thereto, shall sign such certificate, and testify their consent to such allowance and certificate, and to the bankrupt's discharge, to be also certified by the commissioners; but the commissioners shall not certify the same, till they have proof by affidavit of such creditors, or of the persons by them respectively authorised, signing the said certificate, and of the power by which any person is so authorised; and the letter of attorney of a creditor residing in foreign parts, attested by a notary public, shall be sufficient evidence in such case of such power. 24 Geo. 2. c. 57. which said affidavit, together with such power to sign, shall be laid before the lord chancellor with the certificate, in order for allowing the same; — and unless the bankrupt make oath, that the certificate and consent of the creditors were obtained fairly and without fraud; and unless the certificate shall, after such oath, be allowed and confirmed by the lord chancellor, or two of the judges to whom he shall refer it; and any of the creditors shall be allowed to be heard against making a certificate, and against the confirmation of it; nor shall any commissioner sign the certificate, till after three parts in five in number and value of the creditors shall have signed it. 5 Geo. 2. c. 30. and 49 Geo. 5. c. 121.

But every security given to the use of any creditor, to induce him to sign such allowance or certificate, shall be void. 5 Geo. 2. c. 30.

Moreover, no bankrupt shall be entitled to such allowance, who hath upon marriage of any child given above 100*l*., unless he prove by his books, or upon his oath, that he had remaining at the time sufficient to pay his debts; or who hath lost in one day the value of 5*l*. or in the whole the value of 100*l*. in twelve months next before his becoming bankrupt, at cards, dice, tables, tennis, bowls, billiards, shovel-board, cock-fighting, horse-races, dog-matches, foot-races, or other pastime or game, or in bearing a part in the stakes, or by betting; or hath, within one year before he became a bankrupt, lost 100*l*. by contracts for the stock of any company, or public funds, where the contract was not to be performed within a week, or where the stock was not actually transferred. 5 Geo. 2. c. 30.

And moreover, by 24 Geo. 2. c. 57.,

when any person shall fraudulently swear, before the major part of the commissioners, or by affidavit exhibited to them, that a sum of money is due to him from the bankrupt, which shall in fact not be really owing; and shall, in respect of such fictitious debt, sign the certificate for such bankrupt's discharge; in such case, unless the bankrupt shall, before the major part of the commissioners have signed the certificate, by writing signed by him, and delivered to one or more of the commissioners or assignees, disclose the fraud, and object to the reality of such debt, the certificate shall be void, and the bankrupt shall not be entitled to his discharge or allowance. *Id.* s. 9.

The bankrupt, after allowance of the certificate, shall attend, on notice in writing from the assignees, to settle accounts, and and shall have 2*s.* 6*d.* a day allowed for attendance; and if he shall neglect or refuse, he shall, on oath made by the assignees before the commissioners, be apprehended and committed to close gaol, by warrant of the said commissioners till he conform. 5 G. 2. c. 30.

Bankrupt dying before distribution, shall not hinder the distribution. 1 J. c. 15.

And if the certificate be allowed in the life-time of the bankrupt, it is good, though it be not confirmed by the lord chancellor till after his death; for the operative force of it arises from the consent of the creditors; and when confirmed, it hath its effects from the beginning. 1 *Atk.* 77.

And the allowance to the bankrupt, being a vested interest, shall go to his executor. 1 *Atk.* 208.

Bankrupt's Discharge. — By 46 Geo. 3. c. 155. All persons against whom any commission of bankrupt shall hereafter issue, and who shall be duly found bankrupt, under the same, shall upon obtaining his, her, or their certificate, be discharged of and from all debts by this act made proveable under such commission, and shall have the benefit of the several statutes now in force.

And by 5 G. 2. c. 30. If a bankrupt shall be arrested or prosecuted for any debt due before that time, he shall be discharged on common bail, and may plead in general, that the cause of action did accrue before he became bankrupt, and may give this act, and the special matter in evidence; and the certificate of his conforming, and allowance thereof, shall be sufficient evidence of the trading, bankruptcy, commission, and other proceedings precedent to the obtaining the certificate; and a verdict shall pass for the defendant, unless the plaintiff can prove that the certificate was obtained fraudulently, or can make appear a concealment by the bankrupt to the value of 10*l*. And if the plaintiff is cast, the defendant shall have full costs.

If the bankrupt shall be taken in execu-

tion, or detained in prison, for debt owing before his bankruptcy, by reason that judgment was obtained before the certificate was allowed and confirmed; any judge of the court, on producing his certificate, may order him to be discharged without fee, 5 Geo. 2. c. 30.

But the bankrupt's discharge, and allowance of his certificate, will not preclude the creditors from proceeding against his sureties. 1 Atk. 83.

The commissioners shall, on lawful request of the bankrupt, declare how they have bestowed his lands and goods, and pay to him the overplus, if any there be. 13 Eliz. c. 7.

Though the bankrupt's certificate extinguishes all those debts which might have been proved under the commission, yet, as he continues under a moral obligation to pay them if he should ever have it in his power, he may make himself again liable at law by a new promise. 1 Atk. 67. — Therefore, where Fenton purchased linen of Trueman, and gave him his promissory note of hand for the amount, but became bankrupt before it became due, and after the bankruptcy gave Trueman another note of hand for the amount, in lieu of the former one; upon which second note of hand, Trueman, not having proved the first note under the commission, sued him subsequent to the obtaining his certificate; it was held, that the certificate was no bar to this demand. Coup. 549. — So also, a bond and warrant of attorney to confess a judgment given by a bankrupt after his bankruptcy for a debt contracted before, is not barred by his certificate, though given in prison, and for the purpose of obtaining his liberty; for the court held, that it was to be considered in the light of a new debt arising upon a new consideration, viz. to procure the defendant's liberty, by which the old debt became extinguished, and is the same as if a new promise had been given for the same debt upon the same consideration. 1 T. Rep. 715.

All property coming to the bankrupt before allowance and confirmation of the certificate, may be claimed by the assignees, for the benefit of the creditors. A person becoming a bankrupt, had purchased a ticket in the lottery; his certificate was signed by the creditors, and within a day or two of being confirmed by the chancellor; in the interim, the ticket was drawn a prize of 10,000*l.* which was claimed by the creditors.

A bankrupt, entitled to a lease, or an agreement for a lease, delivering up the same to assignees, will not be liable afterwards for the rent, nor in respect of covenants; but the lessor, or person agreeing to make such lease, (if the assignees do not determine whether they will or will not accept of such lease, or agreement for a lease) may "apply by petition to the lord chancellor, lord keeper, or lords commissioners

of the Great Seal, praying that they may either so accept the same, or deliver up the lease or agreement for the lease, and the possession of the premises demised, or intended to be demised, who shall thereupon make such order as in all the circumstances of the case shall seem meet and just, and which shall be binding on all parties." 49 Geo. 3. c. 121.

Second Bankruptcy. — If any commission of bankruptcy shall hereafter issue against any person who shall have been discharged by this act, or shall have compounded with his creditors, or delivered to them his estate, and been released by them, or been discharged by an act of insolvency, then the body only of such person conforming shall be free from arrest and imprisonment; but his future estate shall remain liable to his creditors, (his tools of trade, necessary household goods and furniture, and necessary wearing apparel of himself and wife and children only excepted,) unless the estate of such person shall produce, clear of all charge, 15*s.* in the pound. 5 Geo. 2. c. 30.

The 56 Geo. 3. c. 137. recites, that "In and by an act passed in 1 Jac. 1. intituled 'An act for the better relief of the creditors against such as shall become bankrupt,' it was enacted, that no debtor of a bankrupt should be thereby endangered for the payment of his or her debt truly and *bonâ fide* to any such bankrupt, before such time as he should understand or know that he was become bankrupt; and the provisions of the said statute have been found to be beneficial, and it is also expedient to make such provisions respecting the delivery of goods, wares, merchandizes, and effects, as are hereinafter contained; be it enacted therefore, that no person or persons, body politic or corporate, joint stock or other company, having in his, her, or their possession or custody any goods, wares, merchandizes or effects belonging to any person or persons who shall be or become bankrupt, shall be endangered for or by reason of the delivery of any such goods, &c. truly and *bonâ fide* to such person or persons, or to his, her, or their order, before such time as the person or persons, body politic or corporate, joint stock or other company, having such goods, &c. in his or their possession or custody, shall understand or know that the person or persons to whom such goods, &c. do or shall belong, is or are become bankrupt.

"Provided nevertheless, that in all cases in which it shall be proved that the person or persons acting on the behalf of any body politic or corporate, joint stock or other company, in the paying or causing or directing the payment of any debt, or in the delivering or causing or directing the delivery of any goods, wares, merchandizes or effects, to any person or persons, understood or knew that the person or persons or any of them to whom such debt was paid, or such

goods, &c. were delivered, was or were or had become bankrupt, such body politic or corporation, joint stock, or other company, shall be deemed and taken to have understood and known the same."

BARBADOES ALOES, (GER. *Leberaloe*. DU. *Leveraloe*. DA. *Lever-Aloe*. SW. *Lefverfargäd Aloë*. FR. *Aloes hepaticue*. IT. *Aloe epatico o Patica*. SP. *Acibar epatico*. PORT. *Azebre hepatico*. LAT. *Aloe hepatica*.) a bitter juice extracted from the leaves of a plant of the same name. See **ALOES**.

BARBADOES TAR, (GER. *Bergtheer*. DU. *Bergteer*. DA. *Biengtære*. SW. *Bergjära*. FR. *Poir minérale*. IT. SP. and PORT. *Malta*. LAT. *Maltha*.) See **BITUMEN**.

BARBATINA, or **SEMEN CONTRA**, a seed which is efficacious in extirpating worms from the human body. It is imported from Aleppo by way of Smyrna, &c.

BARCALAO, or **BACALAO**, a Spanish word, which the French pronounce *baccala*, or *baccaliau*. By this last name the Basques most commonly call the fish which we style *cod*; and those people also call the isle of Newfoundland, the Isle of *Baccaliau* (Cod Island), because of the large quantity of cod that is caught there. There is, however, a league westward of that large island, another small one, which is more particularly called *Baccaliau*.

The *bacalao* is a kind of cod, perfectly like that of Newfoundland, and is to be met with in several parts of the South Sea; but the greatest quantity is caught on the coast of the island of Juan Fernandez, eighty leagues westward of Valparaiso, on the coast of Chili.

BARCONE, a short and broad vessel, used in the Mediterranean for the carriage of corn, salt, and other provisions, from one place to another.

BARGAIN AND SALE. See **CONTRACT**.

BARGE, a kind of state or pleasure-boat, or boats of burden, chiefly used on rivers, &c. which lead to great cities. There are various kinds of barges, as *royal barge*, *ship's barge*, *sand barge*, &c.

BARGHMOTE, a court which takes cognizance of causes and disputes between miners. By custom of the mines, no person is to sue a miner for ore, debt, &c. but in this court, on penalty of forfeiting the debt, and paying the charge at law.

BARIGA, a species of raw silk, brought from the East Indies.

BARILLA, (GER. *Waidasche*. DU. *Weed*. DA. *Veedaské*. SW. *Dräggaska*. FR. *Vedasse*, *Cendre gravelée*. IT. *Feccia bruciata*. SP. *Cenizas gravelladas*. PORT. *Cinza de Toscanas de tartaro*. RUS. *Smoltschug*. POL. *Smelcuga*. LAT. *Cineres infectorii*.) the name of a sea-plant which grows very plentifully on the coast of Spain. It abounds with soda; and the impure ashes of the plant,

containing that salt in great abundance, form an important article of commerce. The ashes themselves are commonly called *barilla*. See **SOAP**.

BARK, small vessels which carry merchandise from maritime ports, into the inland parts of a country, where there are canals and rivers that are not navigable by larger vessels. In France they are called *barques*; in Holland and Flanders *bilanders*; and in England *barges* and *lighters*.

BARK, in *Botany*, the outer rind of plants. The following are the species chiefly used in medicine and the arts.

Angelina. The tree from which this is obtained, is not correctly known. It is found in the island of Grenada. It is sometimes employed as a vermifuge.

Angustura. This bark is imported in pieces of about six inches long, and one inch and a half in breadth. It is whitish externally, the substance compact, and the colour, when powdered, not unlike that of rhubarb. It is a powerful bitter, joined with an aromatic flavour, and a slight degree of pungency. It is highly useful as a tonic medicine in some kinds of fever, indigestion, and dysentery.

Canella, (*caminga*, *cassia lignea Jamaicensis*, *canella cubana*.) the wild cinnamon tree; growing in Jamaica, Antigua, and other of the Caribbee islands. The bark consists of two parts, an outward and an inward; the outer is about the thickness of a shilling; of an ash-grey colour, interspersed with white spots, and several shallow furrows of a darker colour running through it. The inner bark, which is alone employed, is thicker than that of cinnamon, smooth, of a pale yellowish colour, of pungent aromatic taste, resembling that of cloves; it is not glutinous when chewed, but crumbles between the teeth. It is sometimes sold for winter's bark, which it in some degree resembles. It is used as an aromatic medicine, conjoined with bitters, &c. in dyspeptic complaints.

Cascarilla. (GER. *Kaskarille*. DU. *Kaskarilla*. DA. *Caskarille*. SW. *Schakarillbark*. FR. *Cascarille*, *Chaquerille*. IT. *Cascariglia*. SP. *Cascarilla*. PORT. *Cascarilha*. RUS. *Kaskaril*. POL. *Kaskarel*, *Szakrel*. LAT. *Cascarilla*.) This name is given to the bark of a tree, growing plentifully in the Bahama islands, called by the natives *hathera*, the *croton cascarilla* of Linnaeus, Sp. Pl. 1424.

It is brought to us in curled pieces, or rolled up in short quills about an inch in width, covered on the outside with a rough whitish matter, and brownish within; exhibiting when broken a smooth, close, brown surface. It has a light fragrant smell, and a moderately bitter taste, accompanied by a considerable degree of aromatic warmth. It yields, when burning, a very agreeable smell, somewhat resembling musk.

It is an excellent tonic medicine, and is,

in many cases, superior in efficacy to the Peruvian bark; particularly in debility of the stomach, and indigestion.

Cassia caryophyllata; called also *amomum*, clove-berry tree, sweet-scented Jamaica pepper tree, the bark of which is called clove bark, and sometimes *cassia bark*.

This is the produce of Jamaica, Cuba, and other of the West Indian islands. It is rolled like cinnamon, but is rather thinner, rougher on the outside, and of a dark-brown colour. It is warm and aromatic, and somewhat resembles cinnamon in taste. The smell is like that of cloves, though weaker.

A similar bark is brought from the East Indies, under the name of *culilawan*, or *culilawan*. That distinguished in Europe by the name of *culilawan* is thicker than the other, and has more of a cinnamon colour, but scarcely differs in smell or taste. Rumphius observes, that the outer and inner barks of different parts of the tree differ from each other, whence probably the variation in those brought under different names into Europe.

The unripe fruit of the tree is the Jamaica pepper.

Cassia lignea, or *canella Malabarica*, *cinnamomum Malabaricum*, *carva*, *calihacha*; wild cinnamon tree, Malabar cinnamon tree, or *cassia lignea tree*. The bark of this tree is called *cassia lignea*; and is brought from the East Indies. The best pieces (called *daphnitis*) resemble cinnamon in appearance, but is distinguishable by its breaking short and smooth, while the fracture of cinnamon is fibrous; and by chewing, when the *cassia* becomes mucilaginous, but the cinnamon austere and dry. It resembles cinnamon in flavour, but is weaker; it contains a mucilage, of which cinnamon does not sensibly partake; if powdered, and boiled in water, the water becomes glutinous, so as to concreate on cooling almost into a jelly. That should be chosen which is small, easily broken, fragrant, pungent, sweetish, and mucilaginous when chewed.

Both those barks have nearly the same medicinal properties as cinnamon; they are however weaker, and do not possess any degree of astringency.

Cinnamon, (GER. *Zimmet*, *Kanehl*. DU. *Kaneel*. DA. *Caneel*. SW. *Canel*. FR. *Cannelle*, *Cannelle*. IT. *Canella*. SP. *Canela*. PORT. *Canella*. RUS. *Koriza*. POL. *Cynamom*. LAT. *Cinnamomum*, *Canella*.) is a light, reddish, thin bark, rolled up in long quills of a fibrous woody texture, inclining to red, not unlike rusty iron, of a fragrant smell, and a sweet, pungent taste. The greatest impositions in the sale of cinnamon, are the selling such, being dried again, as has already had its essential oil distilled from it, and imposing the *cassia lignea* in its place. The first of these is discovered by the want of pungency in the cinnamon; the second

by this, that the *cassia*, when held a little in the mouth, becomes mucilaginous, which the true cinnamon never does. This oil has been made genuine in England, from the common cinnamon of the shops, so as to exceed that brought from Holland. The cinnamon is the interior or second bark of the tree that produces it in the East Indies; the people who gather it take off the two barks together, and immediately separating the outer one, which is rough, and has very little fragrantcy, they lay the other to dry in the shade in an airy place, where it rolls itself up into the form we see it. This valuable article is principally grown in the island of Ceylon. It is much used as a cordial, tonic, and astringent medicine. Cinnamon can only be imported into Great Britain from the East Indies, and is reckoned among the garbleable spices by stat. 1 Jac. c. 19.

Peruvian, called also *Cinchona*, and *Jesuits' Bark*. (GER. *Chinarinde*, *Chinachina*. DU. *Kina*, *Quinquina*. DA. *Kina*, *China*, *Chinabark*. SW. *Feberbark*, *China*. FR. *Quinquina*. IT. *China*, *Chinacchina*. SP. and PORT. *Quina*, *Quinquina*. RUS. *China*, *Chinchina*. POL. *Kwinkwinna*. LAT. *Quinquina*, *Cortex Peruvianus*.) There are several species of cinchona, but those chiefly employed are the red and yellow.

The yellow, or common Peruvian bark, is the produce of a tree growing in Peru; the *cinchona officinalis* of Linnæus, the *macrocarpa* of Willdenow. It is brought in pieces of different sizes, some rolled up in short thick quills, and others flat; the outside is brownish, and generally has a whitish moss spread upon it, the inside is of a yellowish or rusty iron colour. The best sort is bitter and astringent to the taste, breaks close and smooth, is friable between the teeth, pulverises easily, and when powdered, is of a yellowish brown colour. The surest test of its goodness is a peculiar smell, which is somewhat musty and slightly aromatic. The inferior kinds, when broken, appear woody, and, in chewing, separate into fibres. That, the taste of which is nauseous, mucilaginous, the surface is polished, and is tough, spongy, or powdery, should be rejected.

The red bark is in much larger and thicker pieces than the common bark. It evidently consists of three different layers. The external is thin, rugged, and covered with a mossy substance, and of a reddish brown colour; the middle is darker, thicker, and more compact; the innermost has a woody and fibrous appearance, and is of a brighter red than the former. It breaks short, and smooth. Its flavour is more bitter and aromatic than that of the common bark. The tree from which it is obtained is not accurately known.

Oak bark dyed red with sanders wood, has been sold for the red Peruvian bark. This may be distinguished by the want of

difference of colour in the several layers of which it is composed.

Peruvian bark is of considerable use in medicine, from its tonic and astringent properties. It is in cases of ague, and continued fever, accompanied with great debility and relaxation, the most efficacious remedy known.

Oak. (GER. *Bork*, *Eichenrinde*, *Loke*. DU. *Run*, *Runne*. DA. *Bark*, *Garverbark*. SW. *Bark*, *Ekbark*. FR. *Tawbrut*. IT. *Scorza di quercia*. SP. *Corteza de encina*. PORT. *Casca do carvalho*. RUS. *Dubowii kora*. POL. *Dab garbarski*.) This is a strong astringent; it is moderately bitter to the taste, without any particular smell. It is employed in medicine occasionally, in diseases attended with much debility and relaxation, and for restraining immoderate discharges of all kinds; but the principal use to which it is applied, is for tanning leather; for which purpose, from its moderate price, and the large quantity of tan it contains, it is well applicable.

It has recently been discovered, that the bark of the larch-tree has precisely similar effects, so far as concerns the arts, as the bark of the oak.

Willow, this bark is considerably bitter and astringent, and has been employed in medicine as a substitute for the Peruvian bark, with the most satisfactory results.

Winter's, is obtained from the wild cinnamon tree; it has been called *Winter's bark*, from a captain of that name, who brought it from the Straits of Magellan in the year 1579. This bark is of different degrees of thickness, from a quarter to three quarters of an inch; of a dark cinnamon colour, having, if rubbed, an aromatic odour, and a pungent, hot, spicy taste. *Canella* has been usually substituted for it; but *Winter's bark* may be distinguished by its being in larger pieces than *canella*, of a more rugged surface, a deeper colour, more agreeable smell, a warmer, more pungent, and less bitter taste.

It is used in medicine as a stimulant and slight tonic.

BARLEY, (GER. *Gerste*. DU. *Gerst*, *Garst*. DA. *Byg*. SW. *Biugg*, *Korn*. FR. *Orge*. IT. *Orzo*. SP. *Cebada*. PORT. *Cevada*, *Sevada*. RUS. *Fatschmen*. POL. *Feczmien*. LAT. *Hordeum*.) a sort of grain very well known. The chief kinds are the long-eared *barley*; the winter, or square *barley*; and the sprat, or battledore *barley*. The meal of *barley* is very white, and good to make bread, particularly if mixed with that of some other corn. It is the substratum of beer and ale; by making it sprout, ferment, and boil, all sorts of malt liquor are extracted from it. See title MALT.

There are other barleys called *pearl barley*, *French barley*, and *Scotch barley*, which have been stripped of their first coat. These kinds are used in the composition of diet-drinks, and are found to be nourishing.

BARLEY-CORN, the least of our long measures, being the third of an inch.

BARLEY-SUGAR, (GER. *Gersten-zucker*. DU. *Garstensukker*. DAN. *Bygsukker*. SW. *Kornsocker*. FR. *Sucre d'orge*, *Sucre tors*. IT. *Pennito*. SP. *Alfenique*. PORT. *Alfenim*. LAT. *Alphenix*.) a preparation of sugar, candied with orange or lemon peel.

BARM. See YEAST.

BARNACLES, in farriery, an instrument composed of two branches joined at one end with an hinge, to put upon horses' noses, when they will not stand quietly to be shod, blooded, or dressed.

Barnacles in the West Indies, are a kind of shell-fish, that penetrate into the bottoms of ships and vessels, which they oftentimes damage so materially, as to give the sheathing the appearance of a honey-comb.

BAROMETER, a machine for measuring the weight of the atmosphere.

BARONET, is a dignity or degree of honour, of inheritance, created by letters patent, and usually descendible to the issue male: it hath precedence before all knights, except bannerets.

BARONS. *Baron* hath divers significations here in England. First, it is taken for a degree of nobility next to a viscount. *Bracton*, lib. 1. c. 8.

There are also barons by office; as the barons of the exchequer, barons of the cinque ports, &c.

Baron and *Feme*, are husband and wife by our law; and they are adjudged but one person: that is, the very being or legal existence of the woman is suspended during the marriage, or at least is incorporated and consolidated into that of the husband: under whose wing, protection, and cover, she performs every thing, and is therefore called in our law French, a *feme covert*.

BARONY, is that honour and territory which gives title to a baron; comprehending not only the fees and lands of temporal barons, but of bishops also, who have two estates; one as they are spiritual persons, by reason of their spiritual revenues and promotions; the other grew from the bounty of our English kings, whereby they have baronies and lands added to their spiritual livings and preferments. The baronies belonging to bishops are by some called *regalia*.

BARRA, a long measure, used in Spain and Portugal, to measure woollen cloths, linen cloths, serges, &c. In Spain it is one-eighth less than an English yard. In Portugal it is equal to the English ell.

BARRACAN or **BARRAGAN**, (GER. *Berkan*. DU. *Barkaan*. DA. and SW. *Barikan*. FR. *Barracan*. IT. *Baracane*. SP. *Baragan*. PORT. *Barregana*. RUS. and POL. *Barakan*.) a French woollen stuff, resembling the English *banagon*, but inferior in quality.

BARRAGE, a linen interwoven with worsted flowers, manufactured in Normandy.

BARRATRY, is a word of divers significations. *In law*, it is used to denote the offence of stirring up strife, by inciting persons to prosecute suits wantonly and vexatiously. It is punishable by fine, imprisonment, and recognizance for good behaviour. 4 *Black. Com.* 154.

By stat. 12 Geo. 1. c. 29. an attorney convicted of barratry shall be transported as a felon.

In commerce, it signifies a fraud committed by the master of a ship against the owners.

In marine insurances, one of the risks insured against, is the barratry of the master or mariners.

And any act of the master or mariners which is of a criminal nature, such as a deviation for the purpose of smuggling or making capture, or which is grossly negligent, tending to their own benefit, to the prejudice of the owners of the ship, without their consent or privity, is barratry. 1 *Str.* 581. 2 *Str.* 1175. *Cowp.* 143. 1 *Ter. Rep.* 325.

And whatever is done by the captain to defeat or delay the performance of the voyage, is barratry in him, it being to the prejudice of the owners. 6 *Ter. Rep.* 379.

But if the act of the captain be done, with a view to the benefit of his owners, as by deviation for the purpose of saving the ship, or the like, and not to advance his own private interest, it is no barratry. *Cowp.* 154.

And an act of the captain, with the knowledge of the owners of the ship, though without the privity of the owner of the goods insured, is not barratry. 1 *Ter. Rep.* 325.

Neither can the master of the ship, if he be also owner, be guilty of barratry; for no man shall be allowed to derive a benefit from his own crime, and which he would do, if he were permitted to recover against the insurers for a loss occasioned by his own act. 4 *Ter. Rep.* 55.

BARREL, a cask or vessel for holding liquids. It contains $51\frac{1}{2}$ gallons wine measure, 36 gallons beer measure, and 34 gallons of vinegar. It is also a dry measure, as a barrel of oats, pitch, tar, &c. See **WEIGHTS AND MEASURES**.

BARRICADE, in the marine, a strong wooden rail, supported by pillars, and extending as a fence across the foremost part of the quarter-deck. In ships of war the intervals between the pillars are filled with cork, old cable, &c. About a foot above the rail, there extends a double rope netting; and between the two parts of the netting are stuffed hammocks, seamen's bedding, &c. to intercept small shot, fired by swivel guns and muskets in time of battle.

BARROW, in the salt-works, wicker cases shaped like a sugar loaf, in which the salt is put to drain.

BARTERING, the exchanging of one commodity for another, or the trucking

wares for wares, among merchants. Such was the original and material mode of commerce, there being no buying till money was invented, though in-exchanging, both parties are buyers and sellers.

The value of goods bartered is always equal to the product of the quantities bartered, into their respective rates. Therefore, multiply the given quantity and rate of one commodity, and this product divided by the rate of the other commodity, will give the quantity, or divided by the quantity will give the rate.

BARUTH, an Indian measure, containing seventeen gantans, which are equal to about fifty-four to fifty-eight pounds of pepper, avoirdupois weight. At that rate a *gantán* ought to weigh about three pounds and a half of pepper.

BARUTINE-SILKS, are those which come from Persia, by way of Seyde, or Said. They are weighed by the damasquin, which contains about six hundred drachms, or about four pounds avoirdupois weight.

BASARUCO, a small base coin in the East Indies, being made only of very bad tin. There are two sorts, good and bad *basarucos*; three good ones are equal to two Portuguese reas, fifteen a vintim, and three hundred and seventy-five a *pardao-xerafin*. The bad ones are of one-sixth less value than the good ones. See **COINS**.

BASIL, among joiners, the sloping edge of a chissel, or of the iron of a plane, to work on soft wood: they usually make the basil twelve degrees, and for hard wood eighteen, it being remarked, that the more acute the basil is, the better the instrument cuts; and the more obtuse, the stronger and fitter it is for service.

BASKET, as a measure, denotes an uncertain quantity, as a basket of medlars is two bushels; of *assafoetida* from twenty to thirty pounds weight, &c. &c.

BASKETS (*GER. Körbe. DU. Bennen. DA. Kurve. SW. Korgar. FR. Corbeilles. IT. Paniere, Cesti. SP. Canastas, Canastos, Cestas, Cestos. PORT. Canastas, Cestas. RUS. Korsinü. POL. Kosze.*) are made of rushes, splinters, willows, osiers, and sallows. The proprietors of marsh lands generally let what they call osier-beds, to persons who cut them at certain seasons, and prepare them for basket-makers. To form an osier-bed, the land should be divided into plots, six, eight, or ten feet broad, by narrow ditches; and if there is a power of keeping water in these cuts at pleasure, by means of a sluice, it is highly advantageous in many seasons. The common osier is cut at three years, but that with yellow bark is permitted to remain a year longer. When the osiers are cut down, those that are intended for white work, such as baskets used in washing, are to be stripped of their bark or rinds, while green. This is done by means of a sharp instrument fixed into a firm block: the

osiers are passed over this, and stripped of their covering with great velocity. They are then dried, and put in bundles for sale. Before they are worked up, they must be soaked in water, which gives them flexibility. The basket-maker usually sits on the ground to his business, unless when the baskets are too large for him to reach their upper parts in that position.

Hampers and other coarse work are made of osiers without any previous preparation, except soaking. Some expert workmen make a variety of articles of wicker manufacture, as work-baskets of different descriptions, table-mats, fruit-baskets for desserts, &c. They have been heretofore an article of considerable exportation, especially to America, and so continue in an inferior degree. They are among the articles, the importation of which is prohibited by the last Russian tariff.

BASON, or, according to Johnson, **BASIN**, (GER. *Becken*. DU. *Bekken*. DA. *Bækken*. SW. *Bäcken*. FR. *Bassin*. IT. *Bacini*. SP. and PORT. *Bacias*. RUS. *Tasii*. POL. *Miednice*.) a term used by glass-grinders for a dish of copper, iron, &c. in which they grind convex glasses, as concave ones are formed on spheres; and by hatters for a round iron mould, in which they form the matter of their hats; and also for a leaden one for the brims of hats, having an aperture in the middle, of a diameter sufficient for the largest block to go through.

BASON, *sale by the*, at Amsterdam, is a public sale made by authority, over which presides an officer, appointed by the magistrates. It is so called because, before the lots are delivered to the highest bidder, they commonly strike on a copper bason, to give notice that the lot is going to be adjudged.

BASSOON, a musical instrument of the wind sort, blown with a reed, furnished with cloven holes, and used as a bass in a concert of hautboys, flutes, &c.

BASS-VIOL, a musical instrument of the same form with that of a violin, but much larger. It is struck with a bow as that is, has the same number of strings, and has eight stops, which are subdivided into semi-stops: its sound is grave, and has a much nobler effect in a concert, than that of the violin.

BASTARD. All persons born out of lawful matrimony, are bastards by the common law. 1 *Inst.* 244.

And all persons born within marriage are legitimate, unless there is an apparent impossibility that they should be generated by the husband.

If therefore the husband be an eunuch, so that he cannot by any possibility beget a child, if his wife hath issue, this will be a bastard, though it was begot within marriage.

So if a male of seven years old is married to a female of fourteen, and she, before the male is thirteen, has issue, this issue is a bastard; because no law will

intend, that an infant under that age can beget a child. 4 *Viner*, 8vo. ed. 215.

And in general, though the husband and wife live in England, yet if the husband had no access, the child is a bastard; but this proof must be clear, otherwise access will be presumed in favour of legitimation. 3 *Dick. Pract. Expos.* 58.

If a marriage be declared null and void, by divorce, the issue is illegitimate; for where the marriage is nullified, it is a copulation without marriage, and consequently the issue are bastards; but till there be a divorce, the issue is not a bastard; for though the marriage be unlawful, yet it remains good till the sentence of divorce be pronounced. *Roll's Ab.* 557.

And if there be a divorce for adultery *a mensa et thoro*, the issue born afterwards are presumed, *prima facie*, not to be the husband's, unless it appear upon proof that the husband after such separation did cohabit with his wife. 1 *Bacon's Abr.* 311.

But in a voluntary separation by agreement, the law will suppose access, unless the negative be shewn. 1 *Black. Com.* 457.

By stat. 18 Eliz. c. 5. the mode of providing for bastards, so that they shall not become burthensome to the parishes where born, is directed to be by the reputed father entering into recognizance before a justice of the peace to indemnify such parish by one of two alternatives; viz. either by giving a private security to the overseers of the poor, or by abiding such order of two justices for the maintenance of the child as shall thereafter be made when the child shall have been born. Stat. 6. Geo. 2. c. 31. regulates the proceedings thereon; and 49 Geo. 3. c. 68. amends the former laws, so far as respects the public indemnity by the order of two justices. Lastly, stat. 54 Geo. 3. c. 170. explains and regulates the mode of indemnity by private security.

For the modern determinations on these subjects, see 3 *Dick. Pract. Expos.* 59.

BAT, **BATE** or **BATZ** or **BATZEN**, a small copper coin, mixed with a little silver, current in several cities in Germany: it is worth four crutzers, or $\frac{1}{12}$ sterling. It is also a coin of Switzerland, current at five livres, or one hundred sols French money, or 4s. 2d. English.

BATMAN, a weight used at Smyrna, containing six oke, of four hundred drachms each, equal to sixteen pounds, six ounces, and fifteen drachms of English weight.

BATTEN, a name in common use for a scantling of wood about one inch thick and three wide, sometimes more and sometimes less; the chief use of which is to line the walls of houses, in order to prevent the damp from striking through. Ordinary doors and window shutters are also made of them.

BATTERY, (from the Fr. *battre*, to strike, or Sax. *batte*, a club,) is an injury

done to another in a violent manner, as by striking or beating of a man, pushing, jolting, filiping upon the nose, &c. And it is also defined by our law to be a trespass committed by one man upon another, *vi et armis et contra pacem*, &c. This offence is punishable by action and indictment; and on action for the injury at the suit of the party, the defendant shall render damages, &c. On indictment at the suit of the king, for a breach of the peace, he shall be fined according to the heinousness of the offence. *Dalt.* 282. 1 *Hawk. P. C.* 134.

BATTLE, beside its ordinary colloquial acceptance, signifies a *trial by combat*, which has been allowed by our laws ever since the time of our Saxon ancestors, where defendant (in an appeal of murder or felony) may fight with the appellant, in order to make proof thereby whether he were guilty or innocent. The process of appeal having fallen much into disuse, it is only necessary to refer to 4 *Black. Com.* 512. *Archbold's Edit.*

BAWDY-HOUSE, a house of ill fame, kept for the resort and commerce of lewd people of both sexes. The keeping of a bawdy-house comes under the cognizance of the temporal law, as a common nuisance. Those who keep bawdy-houses are punished with fine and imprisonment; and a lodger who keeps only a single room for the use of bawdry is indictable for keeping a bawdy-house. Persons resorting to a bawdy-house are punishable, and they may be bound to the good behaviour, &c. But if one be indicted for keeping or frequenting a bawdy-house, it must be expressly alleged to be such a house, and that the party knew it, and not by suspicion only. And a constable, upon information that a man and woman are gone to a lewd house, or about to commit fornication or adultery, may, if he finds them together, carry them before a justice of peace *without any warrant*, and the justice may bind them over to the sessions. 2 *Dick. Pract. Expos.* 39.

Constables in these cases may call others to their assistance, enter bawdy-houses, and arrest offenders for breach of the peace: in London they may carry them to prison; and by custom of the city whores and bawds may be carted. 3 *Inst.* 206.

BAY - BERRIES, (GER. *Lorbeereren*. DU. *Bakelaaren*. DA. *Laurbær*. SW. *Lagerbär*. FR. *Baies de laurier*. IT. *Coccole o bacche d'alloro, Orbacche*. SP. *Bayas de laurel*. RUS. *Laurowie jagodiü*. POL. *Bobki*. LAT. *Lauri baccae*;) are the berries of the laurel tree.

BAY-LEAVES, (GER. *Lorbeerblätter*. DU. *Laurierbladen*. DA. *Laubærblader*. SW. *Lagerbärblader*. FR. *Feuilles de laurier*. IT. *Fogliä d'alloro*. SP. *Hojas de laurel*. PORT. *Folhas de louro*. LAT. *Lauri foliä*;) are the leaves of the laurel tree. The extract of laurel leaves is a rank poison. The leaves

are wrapped round the wedges of licorice-ball imported from Spain, &c. in order to prevent them from adhering to each other. Both bay-leaves and bay-berries are frequently used for medicinal purposes.

BAYS. See BAIZE.

BAY-SALT, (GER. *Baysalz*, *Seesalz*. DU. *Zeezout*. DA. *Söesalt*. SW. *Bojsalt*, *Hofssalt*. FR. *Sel marin*. IT. *Sabe marino*. SP. *Sal marina*. PORT. *Sal marinho*. LAT. *Sal marinum*;) a salt made from the sea water. See SALT. It is commonly employed in the making up of provisions for exportation.

BAZAR, BAZARI, or BAZAARD, a place designed for trade among the eastern nations, particularly the Persians, some of which are open at top, like the market-places of Europe; others are covered with high vaulted ceilings, and adorned with domes to give light.

At Constantinople the old and new bazar are large square buildings, covered with domes, and sustained by arches and pilasters; the former chiefly for arms, harnesses, and the like; the latter for goldsmiths, jewellers, furriers, and all sorts of manufactures.

BAZAT, or BAZA, a long, fine-spun cotton, which comes from Jerusalem, whence it is also called Jerusalem cotton.

BAZENDGES, a vegetable substance used by the Turks, and other eastern nations, in the scarlet dyeing. For this purpose it is mixed with cochineal and tartar, in the proportion of two parts of bazendges to one of cochineal.

BDELLIUM. See GUM.

BEACON, a public signal to give warning against rocks, shelves, invasion, &c. It is made sometimes by putting pitch barrels upon a long pole, and fixing them upon an eminence, so that they may be seen at a distance; for the barrels being fired, the flame in the night-time, and the smoke in the day, give notice, and in a few hours may alarm the whole kingdom, upon an approaching invasion, &c. By 8 Eliz. c. 13. s. 2. The masters, wardens, and assistants of the Trinity House, may at their cost set up *beacons*, and marks for the sea, in such places, near the coasts or forelands, as to them shall seem meet. And no man may erect a light-house, *beacon*, &c. without lawful warrant and authority. 3 *Instit.* 204.

BEACONAGE, a tax or farm paid for the use and maintenance of a beacon. The Trinity House is empowered to levy this tax by act of parliament.

BEADS, (GER. *Rosenkränze*. DU. *Paternosters*. DA. *Paternosterbaand*. SW. *Raband*. FR. *Rosaires*. IT. *Corone*. SP. *Coronas*. PORT. *Coroas, Rosarios, Avemarias*;) The common glass, of which beads are made for necklaces, &c. is coloured with manganese only. Glass beads, or bugles, are exported in large quantities to Africa, and are given

in exchange to the natives for their commodities.

BEAD-Proof, among distillers and venders of liquors, a fallacious mode of determining the strength of spirits, from the continuance of the bubbles, or beads, raised by shaking a small quantity of them in a phial.

BEAK, or **BEAK-HEAD**, of a ship, that part without a ship, before the fore-castle, which is fastened to the stern, and is supported by the main knee.

BEAM, **BEAMS**, (GER. & DU. *Balken*. DA. *Bielker*. SW. *Balkar*, *Bielkar*. FR. *Poutres*, *Solive*. IT. *Travi*. SP. *Vigas*. PORT. *Traves*, *Vigas*. RUS. *Brewna*. POL. *Balky*.) The largest piece of wood in a building, which lies across the walls, and serves to support the principal rafters of the roof, and into which the feet of these rafters are framed. No building has less than two of these beams, viz. one at each end, into these the girders of the garret roof are also framed; and if the building be of timber, the teazle tenors of the posts are framed into them. The proportion of beams in or near London are fixed, by statute, as follows: a beam of fifteen feet long, must be seven inches on one side of its square, and five on the other; if it be sixteen feet long, one side must be eight inches, the other six, and so proportionably to their lengths.

BEAMS of a Ship, are the great main cross-timbers, which hold the sides of the ship from falling together, and which also support the decks and orlops. The main-beam is next the main-mast, and from it the others are reckoned by first, second, third beam, &c. The greatest beam is called the midship beam. See **SHIP**.

BEAM-Compass, an instrument consisting of a square wooden or brass beam, having sliding sockets, that carry steel or pencil points; they are used for describing large circles, where the common compasses are useless.

BEAM of an Anchor, the largest part of it, called also the shank.

BEAM, also denotes the lath, or iron, of a pair of scales; sometimes the whole apparatus for weighing goods is so called: thus we say, "It weighs so much at the king's beam."

BEAM of a Plough, that in which all the parts of the plough tail are fixed. It is commonly made of ash, and is eight feet long; but in the four-coultered plough it is ten feet long.

BEAM, or **ROLLER**, among weavers, a long and thick wooden cylinder, placed lengthwise on the back part of the loom of those who work with a shuttle. That cylinder on which the stuff is rolled, as it is weaved, is also called the beam-or roller, and is placed on the fore part of the loom.

BEANS, (GER. *Bohnen*. DU. *Boonen*. DA. *Bønner*. SW. *Bönor*. FR. *Fèves*. IT. *Fave*. SP. *Habas*. PORT. *Favas*. RUS.

Boobü. LAT. *Fabae*.) a pulse of the large sort. They are an important article both in agriculture and in horticulture, and the species are various.

The *horse bean*, the only sort generally propagated by the plough, delights chiefly in stiff and moist clay soils. Beans are usually mixed with oats as the common provender of horses that work hard, but are of too heating a quality to be given plentifully to those of mere pleasure. Mixed with pease they make good food for pigs. According to the drill husbandry, one bushel plants an acre of ground.

Of the *garden bean* there is an almost infinite variety, inasmuch as some species or other is a native of almost every country on the globe, and most of them have been introduced at different periods into these kingdoms.

Those from Portugal and Spain bear putting into the ground the earliest, and therefore produce the first crops. A kind called the *Windsor bean*, supposed by some to be indigenous, is principally to be relied on for the late crops.

There are varieties of that species of bean, known by the name of *kidney bean*, that almost defy enumeration. The principal use that we make of them here is by boiling in the pod while green; but on the continent many of them are suffered to ripen, and the corn separated from the pod is used in different articles of cookery for the table during the winter season.

The flour of beans was formerly much used as a cosmetic. The straw of beans, cut by an instrument, in conjunction with wheat straw and coarse hay, makes excellent provender for horses of the plough. It also produces ashes useful in several manufactures, especially that of glass.

BEARER of a Bill, is the person in whose hands the bill is, and in favour of whom the last order or indorsement was made. Checks or drafts on the bank or bankers, are frequently made payable to *bearer*, but bills of exchange seldom or ever are made payable to bearer. See **BILLS OF EXCHANGE**.

BEARER, in architecture, a post or brick wall, trimmed up between the two ends of a piece of timber, to shorten its bearing, or to prevent its bearing with the whole weight at the ends only.

BEARING, in the sea language When a ship sails towards the shore, before the wind, she is said to bear in with the land or harbour. To let the ship sail more before the wind, is to bear up. To put her right before the wind, is to bear round. A ship that keeps off from the land, is said to bear off. When a ship that was to windward comes under another ship's stern, and so gives her the wind, she is said to bear under her lee, &c. There is another sense of this word, in reference to the burden of a ship,

for they say a ship *bears*, when having too slender or lean a quarter, she will sink too deep into the water with an over-light freight, and thereby can carry but a small quantity of goods.

BEARING of a Piece of Timber, among carpenters, the space either between the two fixed extremes thereof, when it has no other support, which they call bearing at length, or between one extreme, and a post, brick wall, &c. trimmed up between the ends to shorten its bearings.

BEAR-SKINS, a sort of fur very much esteemed, and which gives rise to a large trade. The old bear-skins are used for housings or horse-cloths, &c. The skins of the young *bears* serve to make muffs, tip-pets, &c. for ladies' wear. Of bear-skins the principal colours are black, brown, and silver-grey. The skins are brought from America, and the northern parts of Europe and Asia.

BEATERS, a term well understood in commerce, for those artizans who hammer certain metals; whence there are gold-beaters, who prepare gold and silver by reducing them to thin leaves for gilding and silvering copper, iron, wood, &c.; tin-beaters, who prepare that metal for using in conjunction with quicksilver in the manufacture of looking-glasses; plaster-beaters, who reduce gypsum to a powder for various purposes of manufacture. There are also paper-beaters, book-beaters, hemp-beaters, &c. &c.

BEAVER, (GER. *Biber*. DU. *Beever*. DA. *Bever*. SW. *Bäsver*. FR. *Bievre*, *Castor*. IT. *Bivaro*, *Bibaro*, *Castore*. SP. & PORT. *Castor*. RUS. *Bobr*. POL. *Bobr*, *Kastor*. LAT. *Castor*, *Fiber*.) An amphibious animal, formerly very common in this kingdom, but now extirpated. They are found occasionally on some parts of the southern European continent, and are frequent in the northern; but abound in North America, where their skins make a considerable article of exportation to Europe, as well for furs to be worn in apparel, as for the hair to be mixed with wool and manufactured into hats. The skins, when shorn of the hair and tanned, are also useful for many inferior purposes, as the covering of trunks, &c. Considerable quantities of the fur of beaver, as well as of hares, used to be brought from Russia; but by the Russian tariff, published in 1816, they are among the prohibited articles of exportation.

BEDS, (GER. *Betten*. DU. *Bedden*. DA. *Sæng*. SW. *Säng*. FR. *Lits*. IT. *Letti*. SP. & PORT. *Camas*. RUS. *Posteli*.) All beds that are for sale must be filled with one sort of stuffing only, on the pain of forfeiture; as the mixing of feathers, down, scalded feathers, dry pulled feathers, any ways together, is conceived to be injurious to a man's body to lie on. Also bed-quilts, mattresses, and cushions, stuffed with horse-hair, fen-down, goats' hair, and neats' hair,

which are dressed in lime, and in which the heat of a man's body will exhale, and cause them to yield a noxious smell, are prohibited by statute.

BED, of the Carriage of a Great Gun, a thick plank that lies under the piece, being in fact the body of the carriage.

BED, in masonry, a course or range of stones; and the joint of the bed is the mortar between two stones placed over each other.

BED-FEATHERS. See title **FEATHERS**.

BEE, in physiology and husbandry, a winged insect remarkable for its skill and industry in collecting honey and wax from flowers. (See further those titles respectively.) According to the Linnean system, the bee is a genus of insects, of which there are no less than 55 different species. The bee, which alone we have any interest in describing, is usually denominated the hive bee. Nature indicated hollow trees to these creatures as receptacles for their produce, on which man has improved, by presenting them with hives. These hives are commonly made of twisted straw, nicely bound together, which are warm, and at the same time light and easily moveable. There is no method, however, of obtaining the honey from these straw hives without destroying the bees by suffocation with brimstone smoke. But a method has obtained of late years of constructing a stationary hive of wood, with small windows of glass, and surmounting it, when the wooden one is filled with honey, by a larger one of straw, leaving an interval between them, which will soon be filled also with honey. This may be taken away, and replaced by an empty one, and so on in succession, without destroying the bees. To give any more perfect description of these improved receptacles, would inevitably lead to a minuteness of description incompatible with our limits, we must therefore refer the reader, for more practical information, to works expressly dedicated to this particular subject; adding only, that at the price for which wax as well as tallow now generally sell, there are few articles of husbandry which offer greater advantages to the cultivator than the propagation of bees.

A species of bee is common in America, which swarms in the woods, the honey from which is as clear and liquid as rock-water, and is much used infused in water as an agreeable beverage. The combs of these hang from the trees somewhat like clusters of grapes, and the wax of them is not very unlike the black grapes in colour.

BEECH, a forest-tree, is very thick and full of branches, and grows remarkably well in heavy lands, on mountains, and even in a stony or rocky soil. The fruit, which is called *mast*, consists of two triangular nuts, which are enclosed in a rough hairy rind, divided into four parts. The timber is used for making household furniture, &c. And the *mast* or fruit is good for fattening hogs,

deer, &c. and is said, in the earliest stages of society, to have been used commonly for the food of men. The beech is one of the most ornamental trees, but is too heavy and too brittle for timber generally, although, not being liable to splinter, it is now used in ship-building a good deal. See further, title WOOD.

BEECH-OIL, an oil drawn by expression from the *mast* of the beech tree, after it has been shelled and pounded. This oil is very common in some parts of France, and is used instead of butter.

BEEF, of this article immense quantities are salted and made up in tierces, barrels, and half-barrels, in all the sea-ports in Ireland, for exportation to the East and West Indies, &c. and so well cured, that after a voyage to India and back to this country, the *beef* returns as sweet and good as when exported thither. In Ireland it is the principal business of the coopers who make the casks, to purchase, for the merchants, from the slaughter butchers, the carcasses of beef, pork, &c. which are then sent to the cooper's yard, and cut up in small pieces, and salted with Liverpool white salt, mixed with that of St. Ubes, and a proportionate quantity of saltpetre, and after lying a few days in the salt, are packed into the different sort of casks provided for that purpose, with a quantity of strong salt pickle about them, and the head of the cask completely covered with salt. When headed, the casks are laid on their sides, hung up, and in some days after, a quantity of pickle is put in at the bung hole, till the cask is completely full; the beef is then ready for shipping. On the end of the cask is branded the exporter's name, with the words *ox beef* or *mess beef*, as may be.

The statutes respecting *beef* are, viz. 12 Car. 2. c. 4. 18 Car. 2. c. 2. 20 Car. 2. c. 7. 22 Car. 2. c. 13. 3 & 4 W. & M. c. 8. 5 Geo. 2. c. 20. 5 Geo. 2. c. 6. 4 Geo. 3. c. 28.

BEELE, a kind of pick-axe, used by the miners for separating the ores from the rocks in which they lie: It is called a *tubber* by the miners of Cornwall.

BEER, (GER. *Bier*, *Gerstenbier*. DU. *Bier*. DA. *Ol*, *Oll*. SW. *Ol*. FR. *Biere*. IR. *Birra*, *Cervogia*. SP. *Cerveza*. PORT. *Cerveja*. RUS. and POL. *Piwo*. {LAT. *Cerevisia*.) a common and well known liquor, used in those parts of Europe where vines will not grow, and where cyder is scarce.

Beer, from the German *Bier*, is a generic term for *drink* extracted from malt. The species are as numerous as the descriptions of *grain*, the qualities to be extracted from them, and the processes employed in malting and brewing them. Barley is generally used in England, and of that grain ale, porter, strong beer, purl, and various other liquors (all only different species of beer) are composed, by the addition of other ingredients, and the different methods of

preparing the malt, according to the respective liquors which it is intended to produce. But beer may be extracted from most other sorts of grain after having undergone the process of what is denominated *malting*. Oat beer is not uncommon in Scotland, and a similar liquor made from maize, or Indian wheat, in America.

Beer was known to the ancients, as we learn from various authors, especially from the old physicians; but it is perhaps not to be traced to a greater antiquity in this country than the reign of king Henry VII., when historians tell us the Flemings had a licence from the crown to bring it into England.

Lexicographers mostly insist that beer must, *ex vi termini*, be extracted from malt and hops. But this is incorrect, as we ascertain both from history and experiment. We read nothing of hops being introduced into this kingdom till the reign of king Edw. VI., when they were made the object of a legislative provision in 1552, the 6th year of his reign; and we know, from the various statutable prohibitions against substituting other bitter ingredients for the preservation of beer, that the application of others has been found practicable.

Beer has, in modern times, been an object of the greatest solicitude to the legislature in two distinct points of view, viz. as a general and a salutary beverage for the labouring classes of the community, and also as the subject of a considerable revenue to the state.

In the *former* of these views are to be considered all those numerous statutes which have been enacted from 1 W. c. 24. to the 56 Geo. 3. c. 58. prohibiting the use of all deleterious drugs in the manufacture of beer, and the substitution of any ingredients instead of malt and hops. 1 *Dick. Pract. Expos.* p. 38. *Id.* v. 3. p. 6.

In the *latter*, all those which impose a duty of excise on malt and on hops respectively, as well as those which require licences to be taken out by persons who sell beer, under its different denominations, by retail, the last and most comprehensive of which is 56 Geo. 3. c. 115.

English beer was, during the whole reign of the empress Catherine of Russia, an article of very considerable exportation. It went principally from Burton and Newark, both in the county of Nottingham, through the port of Hull, in the county of York; but by the Russian tariff, promulgated by an ukase, bearing date at St. Petersburg, in March 1816, beer of all kinds, except *English porter*, is prohibited from being imported into the Emperor's dominions.

BEHAVIOUR, *Good*, formerly denoted by the term "*good-behaviour*." There are many instances of misbehaviour which do not amount to actual breaches of the peace, and which do not come under any defined head of crime, which are, nevertheless, of so disorderly a kind as ought to be noticed and

prevented. For this purpose, justices of the peace have the power to require from eaves-droppers, night-walkers, common prostitutes, and other such offenders against public order and decorum, sureties to be of good behaviour. 4 *Black. Com.* 251.

BEIGE-SERGE, called so by the people of Poitou; it is black, grey, or tawney-coloured. It is also called sheep-coloured serge, or natural serge; because the wool of which it is manufactured is never dried, being employed both for warp and woof, such as it comes from the sheep. *Beiges* ought to be composed of thirty-eight or thirty-nine reeds at least, each reed being of twenty threads.

BEJUTAPAUTS, a species of blue and red cheque calicoes, brought from Bombay, and are what is called by the East India Company *prohibited goods*, must therefore be sold for exportation.

BELAY, in the sea language, is to make fast the ropes in their proper places.

BELELAIS, a species of silk resembling taffetas, manufactured at Bengal: the piece contains 20 yards.

BELL, (*GER. Glocken. DU. Klokken. DA. Klokker. SW. Klockor. FR. Cloche. IT. Campana. SP. Campanas. PORT. Sinos. RUS. Kolokolü. POL. Dzwony.*) a well known machine, ranked by musicians among the musical instruments of percussion. The music of bells is altogether melody; but the pleasure arising from it consists in the variety of interchanges, and the various succession and general predominance of the consonances in the sounds produced. The metal of which a bell is made is a composition of tin and copper, or pewter and copper; the proportion one to the other is almost 20 pounds of pewter, or 25 pounds of tin to 100 pounds weight of copper. There are also bells of an inferior kind made entirely of iron.

BELL-FOUNDER. This business requires the art of properly mixing up and making the bell-metal, to form the mould in the ground, and to fix the core to fill up the hollow part of the inside, so as to give every bell the exact tone and sound intended, as the treble, tenor, bass, &c. Small bells are generally cast by brass-founders.

BELL-METAL, (*GER. Glockengut. DU. Klokspys. DA. Klokkealm, Klokkenpits. SW. Klockgods, Klockmetall. FR. Metal de fonte ou de cloches. SP. and PORT. Campanil. RUS. Koloklnaja mjed. POL. Spiza, Spiz.*) a composition of tin and copper. Bell-metal and hawkbells are prohibited to be imported. See **BELL**.

BELLOWS, (*GER. Blasbülge. DU. Blaasbalgen. DA. Blasebalg. SW. Blasbälgor. FR. Soufflets. IT. Soffietti, Mantici. SP. Fuelles. PORT. Folles. RUS. Mjechi. POL. Miechy.*) a machine contrived so as to agitate the air with great briskness, inspiring and expiring the air by turns, and that only from enlarging and contracting its ca-

pacity. This machine is of various constructions, but in general is composed of two flat boards, sometimes of an oval, sometimes of a triangular figure: two or more hoops, bent according to the figure of the boards, are placed between them; a piece of leather, broad in the middle, and narrow at both ends, is nailed on the edges of the boards, which it thus unites together, as also on the hoops which separate the boards, that the leather may the easier open and fold again; a tube of iron, brass, or copper, is fastened to the undermost board; and there is a valve within that covers the holes in the under boards, to keep in the air. In founderies, and other great works, where a constant and vast heat is required, the bellows are made double, so that there is a constant blast produced by the upward and downward motion of the handle. The action of the bellows, however wrought, whether by water, steam, or men, depends on this; that the air which enters them, and which they contain when raised, is again compressed into a narrower space when they are closed, and it flows out of the pipe with a velocity proportional to the force by which it is compressed.

BEN-CAPED. A ship is said to be ben-caped when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENDING, in the sea-language, the tying two ropes or cables together; thus they say, bend the cable: that is, make it fast to the yard.

BENDS, in a ship, the same as what is called *wails*, or *wales*; the outmost timbers of a ship's side, on which men set their feet in climbing up. They are reckoned from the water, and are called the first, second, or third bond. They are the chief strength of a ship's side, and have the beams, knees, and foot-hooks, bolted to them.

BEN-NUTS. (*GER. Salbnüsse. DU. Benhennooten. DA. Bennüdder. SW. Bennütter. FR. Noir de behen. IT. Noci di been. Ghiande unguentarie. SP. Nucces unguentarias. PORT. Nozes unguentarias. LAT. Nucces unguentariae.*) The nut of the Ben-tree from which a fragrant oil is extracted, remarkable for its not growing rancid for a number of years. It is the produce of Egypt and Arabia.

BENZOEN, or **BENJAMIN**, (*GER. Benzoe. DU. Benzoin, Benjuin. DAN. and SW. Benzoe. FR. Benjoin. IT. Belgiuino, Benzoino. SP. Benjui. PORT. Beijoin. RUS. Ladon rossnoi. POL. and LAT. Benzöim.*) brought to us in masses from the East Indies, particularly from the kingdom of Siam, and the islands of Java and Sumatra, an almost pure resin. See title **GUM**.

BERASNS, a coarse cloth, all made with cotton-thread, which comes from the East Indies, and particularly from Surat.

BERCHEROIT, or **BERCOITS**, a

weight used at Archangel, and in all the Russian dominions; it weighs about 364 pounds avoirdupois-weight.

BERGAMO, a coarse tapestry, manufactured with several sorts of spun thread, as flocks of silk, wool, cotton, hemp, ox, cow, or goat's hair. It is properly a weft of all those sorts of thread, the warp of which is commonly of hemp. It is woven on a loom, almost like linen cloth. Rouen and other parts of Normandy in France manufacture the largest quantities of *bergamos*.

BERGAMOT, the name of a fragrant essence extracted from a species of citron. As this oil exists pure in the peel, being simply deposited in small cells, the extraction is easy, either by expression or distillation. The former is the best, as the oil is not liable to be altered by heat; but more is produced by distillation than by expression: by this mode two ounces of the oil have been obtained from two pounds of the peel.

BERLIN-BLUE. Mix one ounce of the best powdered indigo with four ounces of sulphuric acid, in a glass body or matrass, and digest it for one hour, with the heat of boiling water, shaking the mixture at different times; then add twelve ounces of water to it, and stir the whole well, and when grown cold, filter it. This produces a very rich deep colour. See **BLUE**.

BERYL, called by our lapidaries *aquamarina*, is a pellucid gem of a bluish green colour, found in the East Indies and about the gold mines of Peru, and especially in Siberia and Tartary, where its crystals are sometimes a foot long. The beryl, like most other gems, is met with both in the pebble and columnar form, but in the latter most frequently. In the pebble form it appears of a roundish but flatted figure, and commonly full of small flat faces, irregularly disposed. In the columnar or crystalline form, it always consists of hexangular columns terminated by hexangular pyramids. It never receives any admixture of colour into it, nor loses the blue and green, but has its genuine tinge in the degrees from a very deep and dusky to the palest imaginable of the hues of sea-water. The beryl, when cut and polished, has a considerable lustre. It is ranked among gems; but its value is trifling, compared with the ruby, sapphire, topaz, &c.

BES, an ancient Roman weight; it is two-thirds of an integer, generally of a pound.

BESANT, or **BEZANT**, a coin of pure gold of an uncertain value, struck at Byzantium, in the time of the Christian emperors; hence the gold offered by the king at the altar, is called *besant*, or *bisant*.

BESISTAN, or **BERSTEEN**, a name given to those places at Constantinople, &c. where the merchants have their shops, and expose their goods for sale. A particular *besistan* belongs to each class of merchants.

BESORCH, a coin of tin or some alloyed metal, current at Ormus, at the rate of seven forty-ninth parts of a farthing sterling.

BETEL, or **BETLE**, a kind of long pepper, found in Malabar and other parts of the East Indies.

BETTELLEES, a species of muslin, which comes from Madras. It is a thick sort of muslin, the finest resembling cambric, and the coarser sorts, calico.

BEVELLING, in ship-building, the art of hewing timber with a proper and regular curve, according to a mould which is laid on one side of its surface.

BEY, among the Turks, signifies a governor of a country or town. The Turks write it *begh*, or *bek*, but pronounce it *bey*.

BEZANS, cotton cloths, which come from Bengal; some are white, and others striped with several colours.

BENZOAR, **BEZOAR**, or **BEZOARD**, (GER. *Da. Sw. & Lat. Bezoar. Du. Bezoarsteen. Fr. Bezoard. It. Belzuar, Bezuarro. Sp. Bezar, Bezoar. Port. Bazar. Rus. Bescar. Pol. Bezoar Kamien*.) formerly used as a medicine, to prevent the fatal effects of poison.

BEZOAR, *Oriental*, a moderately hard and heavy stone, very variable and uncertain in size, shape, and colour. It is generally of a round form, and its size is between that of a horse-bean and that of a small walnut, though there are some larger, and others smaller than peas. The ordinary colour is a dusky olive or greenish brown. It is always smooth and glossy on the surface; and, when broken, is found to consist of a great number of coats or crusts of stony matter, laid one over the other; and often formed upon a piece of stick, or seed of a fruit, or some such article, for a nucleus or basis. It is brought to us from Persia, and many parts of the East Indies; it is to be chosen entire, not in scraps or fragments, of a greenish or olive colour, with some mixture of grey in it, and such as, when rubbed on paper, before whitened with ceruse, gives a yellowish colour. There is also an occidental bezoar, which comes from Mexico.

Bezoars are generally supposed to be concretions formed in the stomach or intestines of different graminivorous animals; but it is not completely ascertained in what animal they are found, or how many species may yield them. Several writers attribute very great virtues to the oriental bezoar; but is probable that if it has any action at all, it is merely that of an absorbent earth, as chalk or magnesia.

BIA, a name given by the Siamese to those small shells, which are called cowries throughout almost all the other parts of the East Indies.

BICE, or **BISE**, among painters, a blue colour prepared from lapis armenus. *Bice*

bears the best body of all bright blues used in common work, as house-painting, &c. but it is the palest in colour. It works indifferently well, but inclines a little to sandy, and therefore requires good grinding. Next to ultramarine, which is too dear to be used in common work, it lies best near the eye of all other blues.

BICHET, a French dry measure, differing in quantity in several provinces; it being in some equal to thirteen, and in others to nineteen, bushels, Winchester measure.

BICKERN, (GER. *Ein Speerhaken*. Du. *Speerhaak*. DA. *Sperhage*. Sw. *Sparrstöd*. FR. *Bigorne*. IT. *Bicornia*. Sp. *Bicornia*. PORT. *Bigorna*. LAT. *Incus Bicornis*.) a two-pronged anvil. See **ANVIL**.

BIDON, a liquid measure containing about five pints of Paris, that is about five quarts English wine-measure. It is seldom used but among ships' crews.

BIGAMY, is the having two wives or husbands, but, correctly speaking, *one after the other*, and not two at the same time, for that is more properly *polygamy*. However, in colloquial language, the term is almost invariably used for the offence of marrying a second wife, or husband, the former one being living.

And by 1 Jac. 1. c. 11., if any person on being married, do afterwards marry again, the former husband or wife being living, it is felony. Except 1. where either party has been continually *abroad* for seven years, whether the party in England hath notice of the other's being living or no; 2. where either of the parties hath been absent from the other seven years *within* this kingdom, and the remaining party hath had no knowledge of the other's being alive within that time; 3. where there is a divorce, (or separation *à mensâ et thoro*, 1 Hawk. 174.) by sentence in the ecclesiastical court; 4. where the first marriage is declared absolutely void by any such sentence, and the parties loosed *à vinculo matrimonii*; or 5. where either of the parties was under the age of consent at the time of the first marriage.

And by 35 Geo. 3. c. 67., persons convicted under 1 Jac. 1. c. 11. in England of bigamy, are made subject to the penalties inflicted for larceny, *i. e.* transportation, and returning before the expiration of the term for which they are transported, to be guilty of felony without benefit of clergy, and may be tried in the county where convicted or found at large.

If one of the parties only be under the age of consent, the exception in 1 Jac. 1. extends as well to the party above the age as to the other; because the power of disagreeing was equal on both sides. 4 Black. Com. 163.

In these cases, the first and true wife is

not an admissible witness against her husband, but the second woman is competent to prove the marriage, for she is not his wife so much as *de facto*. 1 Hale, 692, 693.

BIGONTIA, a liquid measure used at Venice, in French *bigot*. It is the fourth part of an amphora, and one-half of the botte. Four quarts, or quartons, make a *bigot*, and four *tischanfera* a quart. See **WEIGHTS AND MEASURES**.

BIIS, both a weight and measure used on the coast of Coromandel in the East Indies. It is the eighth of the maun, containing five seers, and one seer twenty-four tols. See **WEIGHTS AND MEASURES**.

BILANDER, a small flat-bottomed vessel, with only one large mast and sail, and its deck raised half a foot above the plattform.

BILBOES, a punishment at sea, answering to the stocks at land. The offender is laid in irons, or stocks, which are more or less ponderous, according to the quality of the offence of which he is guilty.

BILGE of a ship, the bottom of her floor, or the breadth of the place the ship rests on when she is aground. Therefore, bilge-water is that which lies on her floor, and cannot go to the well of the pump. A ship is said to be bilged when she has some of her timber struck off, as by a rock, and springs a leak.

BILL, a word of diversified signification, as the beak of a bird; an account of money due to a tradesman; a statute proposed to parliament for enactment; a suit, or complaint in a court of equity; a bill of parcels, or account of goods sent to a purchaser; an instrument made of iron, in use with certain trades; a bill of exchange; a bill of lading; a bill of sale; and a bill of store. Further notice will only be taken of the five last-mentioned descriptions.

BILL, an instrument made of iron, edged in the form of a crescent, and adapted to a handle. It is used by plumbers to perform several parts of their work; by basket-makers, to cut the largest pieces of chesnut-trees and other woods; and by gardeners to prune trees. When short, it is called a hand-bill; and when long, a hedge-bill.

BILL OF EXCHANGE. A bill of exchange is a security, originally invented among merchants in different countries, for the more easy remittance of money from the one to the other, which has since spread itself into almost all pecuniary transactions. 2 Black. 466.

It is an open letter of request, from one man to another, desiring him to pay a sum mentioned therein, either to his own order, or to a third person, on his account; by which means a man at the most distant part of the world may have money remitted to him from any trading country. *Ibid*.

In common speech, such a bill is fre-

quently called a *draft*, but a *bill of exchange* is the more legal as well as mercantile expression. *Ibid.* 467.

The person, however, who writes this letter, is called in law the *drawer*, and he to whom it is written, the *drawee*; and the third person, or negotiator to whom it is payable (whether specially named, or the *bearer* generally) is called the *payee*. *Ibid.*

These bills are either foreign or inland, foreign when drawn by a merchant residing abroad upon his correspondent, or *vice versa*, and inland where both the drawer and drawee reside within the kingdom. *Ib.* 467.

Promissory notes, or *notes of hand*, are a plain and direct engagement in writing, to pay a sum specified at the time therein limited to a person therein named, or sometimes to his order, or often to the bearer at large. *Ibid.*

I. *Bills and notes in general.*—The person who makes a bill is called the *drawer*, the person to whom it is addressed the *drawee*; and the person in whose favour it is made, the *payee*; if the drawee accepts the bill, he is called the *acceptor*.

The person who signs a promissory note, is called the *maker*; and the person to whom it is payable the *payee*.

When a bill or note is indorsed, the person indorsing it, is called the *indorser*; and the person to whom it is indorsed the *indorsee*.

A promissory note while in the hands of the payee resembles a bill of exchange, inasmuch as it is for the payment of a sum of money absolutely, and at all events, and when transferred, it is exactly similar to a bill of exchange. *Bayl.* 3. 4 *Term Rep.* 148. 5 *Term Rep.* 482.

No particular words are necessary to make a bill of exchange or promissory note; any order or promise, which from the time of making it cannot be complied with, or performed without the payment of money is a bill or note. *Ld. Raym.* 1397. *Str.* 629.

Thus an order or promise to deliver, or that J. S. shall receive money, or to be accountable or responsible for it to him or order is a good bill. *Ibid.*

A note was in these words, “Borrowed of J. S. 50*l.* which I promise not to pay,” and per *Lord Macclesfield* the word *not* shall be rejected, for a man shall never say I am a cheat, and have defrauded. 2 *Atk.* 32.

But bills and notes must be for the payment of money *only*; and therefore an order, or promise to pay money, and *do some other act*, is not a bill or note. *Bull. N. P.* 272.

And they must be for the payment of money in specie: therefore an order or promise to pay money in good *East India bonds*, is not a bill or note.

And by 48 Geo. 3. c. 88., “All promissory and other notes, bills of exchange, or drafts, or undertakings in writing, for money or goods, for less than 20*s.* in the whole, shall be absolutely void, and persons uttering any such shall forfeit, not exceeding 20*l.* nor less than 5*l.* half to the informer, and half to the poor; to be recovered by a summary conviction, before one justice: on which parishioners may be evidence.”

Also by 17 Geo. 3. c. 30., made perpetual by 27 Geo. 3. c. 16., “All negotiable notes, bills or drafts for more than 20*s.* and less than 5*l.* issued in England, and the indorsements thereon shall specify the names and places of abode of the persons to whom payable, shall bear date when given, and be made payable within 21 days, and the signing of every such bill or note and indorsement thereof, shall be attested by one witness, or else void. Persons publishing or negotiating any such bills or notes contrary to the method prescribed by this act, shall be subject to a penalty of not more than 20*l.* nor less than 5*l.* recoverable as under the first-mentioned act.”

But by 37 Geo. 3. c. 32. and 45 Geo. 3. c. 25. so much of the stat. 17 Geo. 3. c. 30. as relates to the making void notes under 5*l.* payable on demand to bearer is suspended until six months after the ratification of a definitive treaty of peace. But if such notes are not paid within seven days after demand, the justices of peace may enforce payment thereof with costs.

A bill or note must purport that the money mentioned in it shall be payable absolutely and at all events: if it purports to make the payment depend on any uncertainty or contingency, the instrument is not a bill or note. *Bayl.* 8.

Therefore an order or promise to pay money, provided the terms mentioned in certain letters shall be complied with, provided J. S. shall not be surrendered to prison within a limited time; provided J. S. shall not pay the money by a particular day; provided J. S. shall leave me sufficient, or I shall otherwise be able to pay it; or when J. S. shall marry, is no bill or note on account of the contingency to which the payment is subjected. *Bay.* 8. 3 *Ld. Raym.* 67. 8 *Mod.* 363. 4 *Vin.* 240. *Burr.* 323. *Str.* 1151.

So an order or promise to pay out of my growing subsistence or fifth payment when due, or out of money when received, is no bill or note, on account of the uncertainty, whether the subsistence or payment will become due, or the money be received. *Fort.* 281. 10 *Mod.* 294. 316. *Ld. Raym.* 1563. *Black.* 782. 3 *Wils.* 207.

So an order to pay a sum of money out of rents, or other money in the hands of the person to whom it is addressed, is no bill, because it may be, that he has not rent to other money in his hands sufficient to discharge it. *Ld.* 1562. *Str.* 592. *Fort.* 282.

So an order from the owner of a ship to the freighter, to pay money on account of

freight is no bill, because the quantum due for freight may be open to litigation, but such an order from the freighter is, because it is an admission that so much at least is due. *Str.* 1211. *Cowp.* 571.

And an order to pay money as the *drawer's* quarter's half pay by advance, before the pay will be due, is a good bill; because it will be payable, though the half pay shall never become due. *Str.* 762.

So an order or promise to pay money when J. S. shall come of age, specifying the day when that event is to happen, is a good bill or note, because it is payable, though J. S. die in the interim. *Burr.* 220.

And an order or promise to pay within a limited time after a man's death, is a good bill or note, because it must become payable at some time or other, though the exact period is uncertain. *Str.* 1217.

So an order or promise, to pay within a limited time, after the payment of money due from government, is a good bill or note, because it is morally certain that such payment will be made. *Str.* 24. *1 Wils.* 262.

A bill or note payable to J. S. or order, is payable to order, a bill or note payable to J. S. or bearer, is payable to bearer, and in the latter case J. S. is a mere cypher. *Bayl.* 11. *Burr.* 1516.

It was for some time unsettled whether it was not essential, that a bill or note should be payable either to order, or to bearer, but it is now decided that it is not. *6. T. Rep.* 123.

It was also for some time a matter of controversy whether it was not necessary that a bill or note should not express on the face of it to have been made for value received; but it is now settled, that it is not necessary. *Bayl.* 13. *Ld. Raym.* 1418.

The name of the person making it must be inscribed in the body, or subscribed at the bottom of every bill or note, and every bill must be written or signed by the person making it, or some one authorised by him for that purpose. *Bayl.* 13. *Ld. Raym.* 1484. 1542.

If any person signs his name, upon a blank paper, stamped with a bill stamp, and delivers it to another person to draw such bill as he may choose thereon, he is the drawer of any bill to which the stamp is applicable, which such person shall draw thereon. *1 Hen. Black.* 313.

Bills are either *inland* or *foreign*: *inland*, when made and payable within this kingdom; and *foreign* when made or payable abroad—inland bills and notes seldom consist of more than one part: *foreign* bills in general consist of several—the several parts of a bill are called a set; and each part contains a condition, that it shall be payable only so long, as all the others remain unpaid: in other respects, all are of the same tenor. *Bayl.* 14, 15.

This condition should be inserted in each part, and should in each mention every

other part of the set; for if a man with an intention to make a set of three parts, should omit the condition in the first, and make the second with a condition mentioning the first only, and in the third alone take notice of the other two, he might, perhaps, in some cases, be obliged to pay each; for it would be no defence to an action on the second, that he had paid the third, nor to an action on the first that he had paid either of the others: but an omission is not perhaps material, which upon the face of the condition must necessarily have arisen from mistake, as if in the enumeration of the several parts one of the intermediate ones were to be omitted, as for instance, "pay this my first of exchange, second and fourth not paid." *Bayl.* 15.

Where a bill consists of several parts, each ought to be delivered to the person in whose favour it is made, (unless one is forwarded to the drawee for acceptance, and in that case, the rest must be so delivered,) otherwise there may be difficulties in negotiating the bill, or obtaining payment. *Ibid.*

Bills and notes are also unavailable both at law and in equity, unless written on paper duly stamped according to the stat. 55 Geo. 3. c. 184. the stamp duties on bills of exchange are as follow:

Bill of Exchange, viz. inland bill of exchange, draft, or order, for payment to the bearer, or to order, either on demand or otherwise, not exceeding two months after date, or sixty days after sight, of any sum of money,

Amounting to 40s. and not exceeding			
5 <i>l.</i> 5 <i>s.</i>	-	-	0 1 0
Exceeding 5 <i>l.</i> 5 <i>s.</i>	not exc.	20 <i>l.</i>	0 1 6
-	20 <i>l.</i>	30 <i>l.</i>	0 2 0
-	30 <i>l.</i>	50 <i>l.</i>	0 2 6
-	50 <i>l.</i>	100 <i>l.</i>	0 3 6
-	100 <i>l.</i>	200 <i>l.</i>	0 4 6
-	200 <i>l.</i>	300 <i>l.</i>	0 5 0
-	300 <i>l.</i>	500 <i>l.</i>	0 6 0
-	500 <i>l.</i>	1000 <i>l.</i>	0 8 6
-	1000 <i>l.</i>	2000 <i>l.</i>	0 12 6
-	2000 <i>l.</i>	3000 <i>l.</i>	0 15 0
-	3000 <i>l.</i>	-	1 5 0

Inland bill of exchange, draft, or order, for the payment to the bearer, or to order, at any time exceeding two months after date, or sixty days after sight, of any sum of money,

Amounting to 40s. and not exceeding			
5 <i>l.</i> 5 <i>s.</i>	-	-	0 1 6
Exceeding 5 <i>l.</i> 5 <i>s.</i>	not exc.	20 <i>l.</i>	0 2 0
-	20 <i>l.</i>	30 <i>l.</i>	0 2 6
-	30 <i>l.</i>	50 <i>l.</i>	0 3 6
-	50 <i>l.</i>	100 <i>l.</i>	0 4 6
-	100 <i>l.</i>	200 <i>l.</i>	0 5 0
-	200 <i>l.</i>	300 <i>l.</i>	0 6 0
-	300 <i>l.</i>	500 <i>l.</i>	0 8 6
-	500 <i>l.</i>	1000 <i>l.</i>	0 12 6
-	1000 <i>l.</i>	2000 <i>l.</i>	0 15 0
-	2000 <i>l.</i>	3000 <i>l.</i>	1 5 0
-	3000 <i>l.</i>	-	1 10 0

Inland bill, draft, or order, for the payment of any sum of money, though not made payable to the bearer, or to order, if the same shall be delivered to the payee, or some person on his or her behalf, the same duty.

Foreign bills of exchange, drawn singly, and not in a set, the same as an inland bill of same amount.

Ditto, drawn in sets, for every bill of each set, when sum shall not exceed

100 <i>l</i> .	-	-	-	0	1	6
Exceeding 100 <i>l</i> . not exc. 200 <i>l</i> .	-	0	5	0

- 3000 <i>l</i> .	-	-	-	0	15	0

Exemptions. — All bills of exchange, or Bank post bills, issued by the bank of England. — All bills, under 53 Geo. 3. for payment of the wages and pay of officers belonging to the navy. — All bills drawn by the commissioners of the navy, victualling, or transport service, upon the treasurer of the navy. — All drafts or orders for the payment of money to the bearer on demand, and drawn upon any banker, or person acting as a banker, within ten miles of the place where such drafts shall be drawn; provided such place shall be specified in such drafts; and provided the same shall bear date on the day on which the same shall be issued; and provided the same do not direct the payment to be made by bills or promissory notes. — All bills for the pay of his majesty's land forces.

By 48 Geo. 3. c. 149. persons making, accepting, or paying bills or promissory notes not duly stamped, shall forfeit 50*l*. s. 11.

Persons issuing bills or drafts post dated, or without mentioning the place where drawn, without stamps, under the colour of bankers' checks, shall forfeit 100*l*. s. 12.

And persons receiving such bills or drafts, and bankers or others paying the same, shall forfeit 100*l*. *Ibid*.

And all other instruments, bearing the form of notes, but in law deemed special agreements; all which are to be liable to the proper duty.

A bill payable at sight, is not to be considered as a bill payable on demand, and the usual days of grace are to be allowed on such bills. *Bayl*. 24.

If a bill or note is altered, although with the consent of all parties, *after* it has once issued, or *after* the time when it was originally payable, it requires a new stamp. *Ibid*. 5 *Ter. Rep*. 537.

No bill or note can properly be made or indorsed by, nor can a bill be properly addressed to any person incapable of making himself responsible for the payment. *Bayl*. 24.

Therefore an infant cannot make himself responsible for the payment, unless it be

given for necessities. *Carth*. 100. 5 *Salk*. 197. 1 *Ter. Rep*. 40. Nor a feme covert, except in those instances in which she is considered as having an existence independent of her husband. *Bayl*. 25. As where the husband is under a civil incapacity of being here, in cases of attainder and the like: and there are cases, in which it has been decided, that she is to be considered as having an independent existence where she lives apart from her husband, and has a separate maintenance; but in the latter case in all actions brought against her, the husband must be joined for the sake of conformity. 1 *Ter. Rep*. 6. 9. 1 *H. Black*. 354. 350. 4 *Ter. Rep*. 766. 5 *Ter. Rep*. 679. 682. 6 *Ter. Rep*. 605.

And a feme covert may be, by particular custom, permitted to trade on her separate account. *Black*. 1081. 4 *Ter. Rep*. 361. *Burr*. 1776.

A bill may be drawn by the drawer at one place, and addressed to himself at another place, but this in legal operation is rather a note than a bill. *Burr*. 1077.

A bill or note cannot be made payable to any person who is incapable of suing for its payment — a feme covert cannot sue for the payment of a bill or note: an infant can. *Bay*. 26.

But a bill may be made payable to the drawer. *Salk*. 130. And if a bill or note is made payable to a *fictitious person not in esse*, or his order, and is issued with an indorsement in blank, purporting to be made by him thereon, it is as against the drawer or maker to be considered as a bill or note payable to bearer, and so is the bill as against the acceptor, if he knew at the time of the acceptance, that the payee was a *fictitious person*. 1 *Hen. Black*. 315. 516. 569. 3 *T. Rep*. 174. 182. 481.

If a note be signed by several persons, but begins, *I promise*, it is several as well as joint. *Peake*, 150.

The act of drawing bills implies an undertaking for the drawer to the payee, and every other person to whom the bill may afterwards be transferred, that the drawer is a person capable of making himself responsible for its payment, that he shall, if applied to for the purpose, express in writing upon the bill, an undertaking to pay it when it shall become payable, and that he shall then pay it, and subjects him, on a failure in any of these particulars, to an action at the suit of the payee or holder. *Bayl*. 29.

And the making of a note is an express engagement to the payee or person to whom it shall be transferred, to pay the money therein mentioned according to its tenor. *Ibid*.

II. *Indorsement of bills and notes.* — Bills or notes payable to order or to bearer, or containing any words to make them transferrable, may be indorsed or assigned over

to give the assignee a right against all the antecedent parties, whose names appear upon the bill or note; and bills or notes containing no words to make them negotiable, may be indorsed or assigned over, so as to give such indorsee or assignee, a right upon them against the immediate indorser, but not so as to give him a right against any of the antecedent parties. *Bayl.* 30. *Salk.* 132.

Bills and notes are passed, either by delivery only, or by indorsement and delivery: bills and notes payable to order are transferrable by the latter mode only; bills and notes payable to bearer, and bills and notes originally payable to order, and indorsed, as they may be, so as to be payable to bearer, by either. *Bayl.* 31, 32.

On a transfer by delivery, the person making it, ceases to be a party to the bill, or note: but on a transfer by indorsement, he is to all intents and purposes chargeable as a new drawer. *Ld. Raym.* 442. 724. 929, 950. *Salk.* 128. *Str.* 478.

Upon bills and notes for the payment of less than 5*l.* the indorsement must be attested by one subscribing witness, and such indorsement must mention the place and abode of the indorsee, and bear date at or before the making of it. 17 G. 3. c. 30.

But no particular words are essential on the indorsement of either bills or notes: the mere signature of the indorsee is in general sufficient. *Holt.* 117. 12 *Mod.* 192. 244. *Salk.* 126. *Ld. Raym.* 444.

An indorsement which mentions the name of the person in whose favour it is made, is called a full indorsement; an indorsement which does not, a blank one—a blank indorsement, so long as it continues blank, makes a bill or note payable to the bearer; and as long as the first indorsement continues blank, the bill or note, as against the payee, the drawer and acceptor, is assignable by mere delivery, notwithstanding it may have upon it subsequent full indorsements. *Bayl.* 31. *Doug.* 611. 633. *Peake*, 225.

A full indorsement may specially restrain the negotiability of a bill or note: and an indorsement is restrictive, which either has express words making it so, or is made in favour of a person who cannot make a transfer: thus an indorsement in these words, *pay the contents to J. S. only, to J. S. for my use*, or (at least when addressed to the drawee) *the within must be credited to J. S.* is restrictive. *Bayl.* 33. *Burr.* 1227. *Black.* 229. *Doug.* 615. 637.

But the mere omission of the words, *or to his order*, to give a power of transfer will not make an indorsement restrictive. *Bull. N. P.* 275. *Black.* 295. *Burr.* 1216.

A restrictive indorsement precludes the person in whose favour it is made from making a transfer, so as to give a right of action against the person making it, or any

of the antecedent parties, and (where the restriction is expressed upon the bill or note) from retaining a payment to their prejudice. *Doug.* 615. 637.

An indorsement cannot be made for a part of, or less than the full sum, appearing to be due upon the bill or note, otherwise it would subject the party to a variety of actions. *Ld. Raym.* 360. 2 *Wils.* 262.

A transfer by indorsement will convey no title, except against the person making it, unless it is made by him who has a right to make the indorsement: therefore in case of a loss by theft or accident, if the bill or note be only transferrable by indorsement, the thief or finder cannot confer a title against the antecedent parties; for, unless the indorsement be made by the person to whom the bill is payable, it is a forgery, and can confer no title; but if such bill or note be payable to bearer, and therefore assignable by mere delivery, the thief or finder may confer a title against the antecedent parties, by transferring it. And consequently, an innocent holder thereof, for a fair and valuable consideration, may recover the amount thereof, though the party from whom he took it, having no title, cannot. 4 *Term Rep.* 28. *Burr.* 452. 1516.

And by 9 & 10 Will. 3. c. 17. "if any inland bill be lost, or miscarry within the time limited for its payment, the drawer shall on security given, upon request, to indemnify him, if such bill shall be found again, give another bill of the same tenor with the first." s. 3.

The right to transfer a bill or note, is in the payee, or in the person to whom it has been transferred from him: therefore an indorsement by a person of the same name, with the person entitled to transfer it, is void (except against the person indorsing it and the subsequent indorsors), though the person entitled to indorse it was not particularly described upon the bill or note. 4 *Term Rep.* 28.

On a bill or note payable to A. for the use of B., the right to indorse is in A. *Carth.* 5. 2 *Vent.* 307. *Skin.* 264.

On a bill or note payable to several persons, not in partnership, the right to indorse is in all collectively, and not in any individually. *Doug.* 653. n. 134. If a right to indorse a bill or note be in a feme sole, and she marry, it devolves upon her husband. *Str.* 516. 3 *Wils.* 5. If the person who has a right to indorse a bill or note die, it devolves upon his personal representative, and if he becomes bankrupt, on his assignees. 3 *Wils.* 1. *Str.* 1260. 2 *Barnes*, 137.

But if an executor or administrator indorse, he binds himself personally, and not the assets in his hands. 1 *Term Rep.* 487.

The indorsement of a bill or note may be made, either before the expiration of the time limited for its payment, or (unless the

sum payable thereby be under £5. 17 G. 5. c. 30.) at any time afterwards. 1 *Show.* 163. *Ld. Raym.* 575.

But where a bill or note is indorsed over after the time appointed for its payment, if there is any fraud in the transaction, it ought to be left to the jury, upon the slightest circumstance to presume that the indorsee knew of such fraud. 3 *Term Rep.* 83. n. And though he was ignorant of the fraud, any objection which might have been taken against the indorsee may be taken against him, if the bill or note appeared upon the face of it, when he took it, to have been dishonoured. 3 *Term Rep.* 80.

A bill or note dishonoured, cannot be indorsed or negotiated after it has been paid by the drawer, or first payee; for when it comes back to the drawer or first payee, and is taken up by him, its negotiability ceases. 1 *Hen. Black.* 89. n.

If a man indorse his name on a copper-plate bill or note, made in blank, without any sum, date, or time of payment expressed therein, he will be precluded from saying that his indorsement was prior to the completion or issuing of the bill or note, even against a person who knew when he took it, in what state the bill was at the time of the indorsement. *Doug.* 496. 514.

Upon the transfer of a bill drawn in sets, each part must be delivered to the person in whose favour the transfer is made; otherwise the same inconveniences may follow, which would ensue upon a neglect to deliver each of them to the payee. *Bayl.* 41.

The indorsement of a bill or note, implies an undertaking from the indorser, to the person in whose favour it is made, and every other person to whom the bill or note may afterwards be transferred, exactly similar to that which is implied by drawing a bill, except that in the case of a note, the stipulation with respect to the drawer's responsibility and undertaking does not apply; and a transfer by delivery only, if made on account of an antecedent debt, implies a similar undertaking from the person making it, to the person in whose favour it is made. *Ibid.*

III. *Acceptance of bills of exchange.*] An acceptance is an engagement to pay a bill according to the tenor of the acceptance, and a general acceptance is an engagement to pay according to the tenor of the bill. *Bayl.* 42.

This engagement is usually made by the person on whom the bill is drawn, but on his refusal, it may be by some other person, expressing it to be for the honour of the drawer, and in either case the acceptor will be bound. *Burr.* 1672. *Cowp.* 571. *Doug.* 284. 297.

This acceptance, or engagement to pay, may be made before the bill is drawn, or afterwards, and it may be either verbally or in writing, and is either absolute or condi-

tional; and when made after the drawing of the bill, is according to, or varying from its tenor. *Bayl.* 44.

Thus a verbal promise, that *if the bill came back he would pay it*, was held a good acceptance. And in a variety of other cases, parol acceptances have been held good. *Burr.* 1662. 1 *Term Rep.* 182.

Also a conditional acceptance to pay *when goods consigned were sold*, *Str.* 1152.; *when in cash for the cargo of a ship*, 2 *Wils.* 9.; and that the bill would not be accepted till a navy bill was paid, *Cowp.* 572., have been deemed good acceptances.

So also a bill may be accepted, as already observed, varying from its tenor, as for instance, to pay 100*l.* instead of 127*l.* *Str.* 214., to pay at a date different from the time required by the bill, 11 *Mod.* 190., or to pay half in money and half in bills, *Comb.* 452., and the acceptor will be bound, if the holder, who may totally reject the same, acquiesce in such acceptances. *Comb.* 452.

An acceptance is seldom made, before the bill is drawn, by any other person than the drawee: afterwards for the purpose either of promoting the negotiation of a bill, when the drawee's credit is suspected, or to save the reputation, and prevent the prosecution of some of the parties, where the drawee cannot be found, is not capable of making himself responsible, or refuses acceptance, it is not uncommon; and it is called an acceptance for the honour of the person on whose account it is made, and enures to the benefit of all the parties subsequent to such person. *Bayl.* 45.

Such of these acceptances, as are made with the former view, are considered as made, on account of the previous possession of the bill, at the time they are made; and such as are made with the latter, unless they declare the contrary, on account of the drawer. *Ibid.*

If a bill is drawn on several persons, not connected in co-partnership, an acceptance by one will bind him, but him only. *Bull.* N. P. 279. But in the case of two joint-traders, the acceptance of one will bind both. *Mar.* 16. *Beaves*, 228. *Molloy*, c. 10. s. 18.

An acceptance after the bill is drawn, may be made even after the time appointed for its payment. And in such case, an acceptance to pay according to the tenor, will be considered as a general acceptance to pay on demand. *Ld. Raym.* 364. 574.

A written acceptance is either made upon the bill or elsewhere: and on a written acceptance by the drawee, his name need not appear; it is sufficient if he write upon the bill, not putting a direct negative upon its request, as, '*accepted*,' '*presented*,' '*sum*,' '*the day of the month*,' or '*a direction to a third person to pay it*:' all these are *prima facie* complete acceptances. 1 *Atk.* 611. *Bull.* N. P. 270.

An express refusal to accept, written on a

bill, is not an acceptance; though if the drawee intend it as a surprise upon the party, and to make him consider it as an acceptance, it seems, that it may be otherwise. *Bayl.* 48.

A promise to accept, if made upon an executed consideration, or if it influences any person, to take or retain the bill, is a complete acceptance, as to the person to whom the promise is made, in the one case, and the person influenced in the other, and all the subsequent parties in each. *Ibid.*

Thus, a promise to accept such bills as B. should, after the expiration of a month, draw on account of a debt from C. to B. was held a complete acceptance. *Burr.* 1663.

But a promise to accept, made upon an executory consideration, such as when a credit is given to the party, by another house, is not binding so long as such consideration remains executory, unless it influences some person to take or retain the bill. *Burr.* 1666. *Bayl.* 49.

So a verbal promise to accept, though the party expressly defer a written acceptance, as where he says *leave the bill and I will accept it*, is a complete acceptance. *Molloy*, b. 2. c. 10. s. 20. So a verbal promise to accept a returned bill, when it shall come back, is binding if it do come back. *Ann.* 75.

An answer by the drawee when a bill is called for, "there is your bill, it is all right," is no acceptance. *Espin.* 27.

But an acceptance to pay when remitted for, is a conditional acceptance. *Str.* 1211. So an answer by a drawee who lived in London, that a ship was consigned to him and a person in Bristol, and that till he should know to which port the ship would come, he could not accept, connected with a subsequent answer that the bill was a good one, and would be paid, though the ship should be lost, was held a conditional acceptance only; it being clear that the drawee looked for an opportunity of reimbursing himself, and had three events in contemplation, the ship's arrival at Bristol, her arrival at London, and her loss: in the two latter, he should have the opportunity, and therefore accepted; on the former he should not, and did not accept it. *1 Term Rep.* 182.

But an answer by the drawee, that he would pay, if J. S. would not, but that he must first apply to him, not that he thought he would pay, but because he judged it right to put him to the trial, with an assurance to the holder, that he might rest satisfied of the payment, was held an absolute acceptance. *Str.* 648.

If a man intends to make a conditional acceptance only, and gives that acceptance in writing, he should be careful to express the conditions therein, for, of any verbal condition he may annex to the acceptance, he will not be at liberty to avail himself, against any subsequent party, if either such party, or any intermediate one, between him and the

per. on. to whom the acceptance was given, took the bill without notice of such condition, and gave a valuable consideration for it; and at all events, the *onus* of proving such condition will be upon the acceptor. *Bayl.* 51.

But if an agreement to accept is conditional, and a third person takes the bill, knowing of the conditions, he takes it subject to them. *Doug.* 286. 299.

A conditional acceptance becomes absolute, as soon as its conditions are performed. *Burr.* 1663. But if the drawee says he cannot accept without further directions from J. S., and J. S. afterwards desires him to accept, and draw upon A. B. for the amount, the mere drawing upon A. B. will not make this an acceptance, although the actual payment of the bill on him may. *1 Term Rep.* 269.

An acceptance varying from the tenor, differs from it either in the *sum*, the *time*, the *place*, or *mode* of payment. *Bayl.* 52. But though any of these varied acceptances bind the person making them, yet the holder of the bill is entitled, from the undertaking of the drawer and indorsors, to expect an absolute acceptance by the drawee. *Marius*, 22. Or if there be several not connected in partnership, by each, *Molloy*, b. 2. c. 10. for the payment of the full sum of money, mentioned therein, according to its tenor, specifying, *Ld. Raym.* 575. if none be mentioned for the purpose, a place for its payment, and expressing, *Beawes*, 452. if the bill be payable within a limited time after sight, the time of its presentment for acceptance, and may reject any other. *Bayl.* 53.

And if upon the offer of any other acceptance, the holder does any act expressing a non-acquiescence therein, as if he gives notice to any of the antecedent parties generally, that acceptance is refused, or notes the bill for non-acceptance, the offer is not binding. *1 Term Rep.* 182.

It has been supposed, that if the holder strikes out an acceptance which varies from the tenor of the bill, and substitutes an acceptance according to the tenor, he may afterwards restore the acceptance he struck out, and that such acceptance will continue binding; but it has been doubted, *4 Term Rep.* 350. whether the determination went further than to decide, that the alteration in the acceptance (though it annulled the acceptance, and discharged the acceptor) did not destroy the bill as to other parties. *Bayl.* 54.

The obligation of a complete acceptance may be waived, and this waiver may be either express or implied. *Ibid.*

An agreement to consider an acceptance as at an end, *Doug.* 236, 237, 248, 249. or a message, *ibid.* to the acceptor upon an accommodation bill, that the business was settled with the drawer, and he need not give himself any further trouble, is an express

waiver: the receipt of the known consideration of the acceptance an implied one. *Doug.* 284. 297.

If the holder of the bill receives a part of the money from the drawer, and takes a promise from him upon the back of the bill for the payment of the residue, at an enlarged time, it is for a jury to say whether this is not a waiver of the acceptance; but it ought to be left to them with strong observations to shew that it is. *Doug.* 250.

But a neglect to call upon an acceptor, or the receiving a part from the drawer, or other indulgence shewn to any of the other parties, though for ever so long a time, shall not be considered as a waiver of the remedy against the acceptor. *Doug.* 235. 247.

IV. *Presentment of bills and notes.*] The party taking a bill or note, impliedly undertakes to the antecedent parties, who would be entitled to bring an action on paying it, to present in proper time the one, where necessary, for acceptance, and each for payment: to allow no extra time for payment, and to give notice without delay to such persons, of a failure in the attempt to procure a proper acceptance or payment; and a default in any of these respects will discharge such persons from all responsibility, on account of a non-acceptance or non-payment, and make the bill or note operate as a satisfaction of any debt or demand for which it was given. *Bayl.* 57. *Str.* 649. 792.

And by 3 & 4 *Ann.* c. 9. s. 7. (which also places promissory notes on the same footing as bills of exchange, s. 1.) it is enacted, that "if any person doth accept any such bill of exchange, for and in satisfaction of any former debt, the same shall be esteemed complete payment of such debt, if such persons, accepting of any such bill for his debt, doth not take his due course to obtain payment thereof, by endeavouring to get the same accepted and paid, and make his protest either for non-acceptance or non-payment."

The presentment is to be made where the bill or note is payable. *Bayl.* 58. And if the drawee or maker cannot be found at the place where the bill or note is payable, and it appears that he never lived there, or has absconded, the bill or note is to be considered as dishonoured. *Ld. Raym.* 743. If he has only removed, the holder must endeavour to find out to what place he has removed, and make his presentment there. *Str.* 1087.

If, on a presentment, it appears that the drawee or maker is dead, the holder should inquire after his personal representative, and, if he lives within a reasonable distance, present the bill or note to him. *Molloy*, b. 2. c. 10.

If a bill or note is made payable at a banker's, it is sufficient to present it for payment at the banker's; and if the banker is himself the holder, it is sufficient for him to

see whether he has effects in hand. 2 *Hen. Black.* 509.

A presentment should be made at a seasonable time, *Bayl.* 59. and if by the known custom of any place, bills and notes are only payable within limited hours, a presentment there out of those hours is unreasonable. *Ibid.* And so is a presentment out of the hours of business to a person of a particular description, in a place, where, by the known custom of that place, all persons of his description, begin and leave off business at stated hours. *Ibid.*

A presentment for acceptance is not absolutely necessary, except upon bills payable within a limited time after sight. *Molloy*, b. 2. c. 10. s. 16. *Beaves*, s. 266.

No certain time is fixed, within which this presentment must be made, but it should be made within a reasonable time. 2 *Hen. Black.* 569, 570. And what shall be deemed a reasonable time, must depend upon the particular circumstances of each case, and it must always be left to the jury to say whether there has been an improper delay. 1 *Hen. Black.* 569.

No delay, warranted by the common course of business, is improper, nor is any delay, which is occasioned by keeping the bill in circulation, at a great distance from the place, where it is payable: but a delay by locking it up for any length of time is. *Hen. Black.* 565.

If a bill payable abroad at a certain time after sight, is taken in a course of negotiation, it is not necessary to send it, by the first opportunity, to the place where it is payable: and if a bill is payable in India 60 days after sight, it is not necessarily a neglect, to omit presenting it for acceptance for 26 days after its arrival. 2 *H. Black.* 565.

Upon a presentment for acceptance, the bill should be left with the drawee 24 hours, unless in the interim, he either accepts or declares a resolution not to accept. *Ld. Raym.* 281. But a bill or note must not be left (unless it is paid) on a presentment for payment; if it be, the presentment is not considered as made until the money is called for. *Strange*, 550.

A bill or note payable on demand, is payable immediately on presentment; and a bill payable at sight, is either payable immediately upon presentment, or within the days of grace afterwards; and each must be presented within a reasonable time after the receipt, or put into a course of negotiation. *Bayl.* 24. 62.

Upon bills or notes given by way of payment, or paid into a banker's, any time beyond that which the common course of business warrants, is unreasonable. *Str.* 416.

Upon a bill or note of this kind, given by way of payment, the course of business seemed formerly to allow the party to keep it, if it was payable in the place where it was given, until the morning of the next day of

business after its receipt, and till the next post, if payable elsewhere, but not longer.

Thus where a note of this kind, payable in London, was given there in the morning, a presentment the next morning was held sufficiently early: a presentment at two the next afternoon, too late. *Ld. Raym.* 928. *Str.* 415. 1248. 1175.

But in *Appleton v. Sweetapple, B. R. Mic. Ter.* 25 Geo. 3. where a similar note was given at one, and not presented till the next morning, two juries held the delay unreasonable; this, however, was against the opinion of the court, but being a second verdict upon a new trial, they refused to interfere. *Bayl.* 65.

A bill or note of this kind given by way of payment to a banker, must be presented by him, as soon as if it had been paid into his hands, by a customer. *Black.* 1. And a bill or note of this kind paid into a banker's, if payable at the place where the banker lives, must be presented the next time the banker's clerk goes his rounds. *Ibid.*

A bill or note importing to be payable within a limited time, or at sight, is not in fact payable, until the third day after the expiration of that time, unless it happens that the last of the three days is a Sunday or great holiday, such as Christmas day, upon which no money is used to be paid; in which case the party ought to demand the money upon the second day, otherwise it will be at his own peril. 4 *T. Rep.* 148. *Bayl.* 66.

And by 39 and 40 Geo. 3. c. 42. "where bills of exchange and promissory notes become due on *Good Friday*, the same shall be payable on the day before, and the holders thereof may protest the same, for non-payment on such preceding day."

And a presentment on the *second* day, where the third is not a day of rest, is a nullity. *Espin.* 261.

These extra days are called *days of grace*; but different countries vary in the number of days allowed by way of grace. *Beawes*, s. 260. See title *GRACE, days of*, where will be found the number of these days allowed in all the principal cities of Europe.

Upon the last day of grace, and within a reasonable time, before the expiration of that day, a bill or note must be presented for payment. *Bayl.* 67.

But if the holder makes a second presentment on that day, the drawer or maker is entitled to insist on paying it, when such presentment is made, without paying the fees of noting or protesting, notwithstanding such presentment is made, after the banking hours, and for the purpose of noting and protesting. 4 *Ter. Rep.* 170.

Upon a bill payable within a limited time after sight, the time must be computed from its presentment for acceptance. *Beawes*, s. 252. And upon a bill or note payable within a limited time after the date, where it

has no date, from the day it issued. *Ld. Raym.* 1076.

Where the time, after the expiration of which, a bill or note imports to be payable, is limited by months, it is to be computed by *calendar* not lunar months. *Marius*, 19. Thus on a bill or note payable one month after date, and dated the 1st of Jan. the month will not expire till the 1st of Feb. *Beawes*, s. 255.

Where the time is computed by days, the day on which the event happens is to be excluded: thus on a bill or note payable 10 days after date, dated the 1st of Jan. the time does not expire till the 11th. *Ld. Raym.* 280. 1 *Barnard*, 505.

The bankruptcy or known insolvency of the drawee, or maker, is no excuse for a neglect to make a presentment, or to give notice. *Doug.* 497. 515.

Notice must be given of a failure, in the attempt to procure an acceptance, though the application for such acceptance might have been unnecessary. *Burr.* 2670. 1 *Ter. Rep.* 712.

So if the drawee offer a partial or conditional acceptance, or an acceptance at an extended period, or if any other person offer an absolute one, though the holder may be willing to acquiesce in such acceptance, he must give notice. *Bayl.* 71. In that case, however, if he wishes to have the power of availing himself of it, he should mention in his notice the acceptance offered: for a notice generally of non-acceptance, shews he did not acquiesce in such offer. 1 *Ter. Rep.* 182.

A neglect to give notice, upon the refusal of any thing more, than a conditional acceptance, is done away by the completion of those conditions before the bill becomes payable; and a neglect upon the refusal of any thing more, than a partial acceptance, discharges the persons intitled to it only from their responsibility, on account of the non-payment of the residue. *Bayl.* 71.

The notice must come from the holder, and though there is no prescribed form for it, ought to import, that the holder looks on the person, to whom it is given, as liable, and expects payment from him. 1 *Ter. Rep.* 167.

To give this notice, in the case of a *foreign bill*, effect, it is necessary that a minute of the non-acceptance or non-payment, and a solemn declaration on the part of the holder, against any loss to be sustained thereby, (which minute and declaration is called a *protest*, and must on an action against the drawer be proved. 2 *Ter. Rep.* 713. 5 *Ter. Rep.* 239.) should be regularly made. See title *PROTEST*.

Such protest may also be made on the *non-acceptance* of an *inland bill*, if such bill is for the payment of 5*l.* or upwards, within a limited time after date, and the value is

expressed therein to have been received, 3 & 4 Ann. c. 9. or after an acceptance written on such a bill for its non-payment, 9 & 10 W. 3. c. 17. but a protest cannot properly be made on any other inland bills. 4 Term Rep. 170. And a protest upon an inland bill is never necessary where the bill is for the payment of less than 20*l*. 3 & 4 Ann. c. 9. And on such as are for the payment of more, a neglect to procure it, only precludes the holder from recovering against the drawer or indorsers entitled to notice any special damages, costs, or interest, occasioned by the non-acceptance or non-payment. *Str.* 649. 910.

To such of the parties as reside in the place where the presentment was made, the notice must be given, at the furthest, by the expiration of the day following the failure; to those who reside elsewhere by the next post. 1 Term Rep. 167. 2 Hen. Bl. 565.

Sending notice by the post is sufficient; though there is no proof that it was received, and where there is no post, it is sufficient to send by the ordinary mode of conveyance. 2 Hen. Black. 509. Therefore in the case of a foreign bill, it is sufficient to send it by the first regular ship bound for the place to which it is to be sent; and it is no objection, that if sent by a ship bound elsewhere, it would by accident have arrived sooner, though the owner wrote other letters by that ship to the place to which the notice was to be sent. 2 Hen. Black. 565.

The drawer of a bill, and (where the acceptance appoints the payment to be made elsewhere than at the acceptor's house) the acceptor, and every person who transfers a bill or note is, *prima facie*, to be presumed entitled to bring an action on paying it, and therefore entitled to insist on a want of notice, or on a neglect to make a proper presentment, but the contrary may be proved. 1 Ter. Rep. 405. 712. and payment of part, *Str.* 1246. or a promise to pay, 2 Term Rep. 713. Buller 276. after full notice of the default, sufficiently evinces the contrary; but a payment or promise without such notice does not. *Burr.* 2670.

Proof that the drawer had no effects in the hands of the drawee from the time the bill was drawn until it became payable is sufficient, at least *prima facie*, to shew, that the drawer would be entitled to bring no action on paying the bill, and has therefore no right to insist on notice, for in such case he cannot be injured by the want of notice. 2 Term Rep. 713. 1 Term Rep. 712.

If the payee of a note lends his name, merely to give it credit, and to enable the maker to raise money upon it, and knows at the time that the maker is insolvent, he is not entitled to notice, for under such circumstances, no loss could happen to him from the want of notice. 2 Hen. Black. 356. So if the payee lends his name to secure a com-

position from the drawer to a creditor, and takes effects of the drawer to answer it, he is not entitled to notice. *Espin.* 302.

But it is no excuse for not having presented a note in time for payment, that the defendant indorsed it to guarantee a debt from the maker, or that the defendant knew before it was due, that the maker could not pay it, and had desired a banker, at whose house it was made payable, to send it to him, and he would pay it: for, though the justice of such a case may be with the plaintiff, yet an indorsement by way of guarantee only, is liable to all the legal consequences of an indorsement, and the undertaking to pay, can only be taken to extend to such notes as are duly presented. 2 Hen. Black. 609.

Nor is it any excuse for not giving notice to the drawer of a bill, if he had effects in the hands of the drawee, that the drawee represented to the drawer when the bill was drawn, that he should not be able to provide for it, and that the drawer thereby understood that he should have to provide for it. *Espin.* 332.

Each party, immediately upon the receipt of notice, ought to give a fresh one to such of those persons who are liable over to him, against whom he must prove notice. *Bayl.* 83.

V. Remedies for non-acceptance or non-payment. — Upon non-acceptance or non-payment, the holder of a bill or note may sue all the persons liable to him, on account of such non-acceptance or non-payment, either at the same time, or successively one after the other. *Bayl.* 84.

An indorsor, an acceptor for the honor of an indorsor or drawer, or the drawer is, after payment by him, holder; but he holds in his original capacity, not as upon a transfer from the person he has paid. 1 Wils. 185. 4 Bro. P. C. 604.

So the bail of any of the parties who are sued, or any persons who pay the bill or note, on account of any of the parties, become, on payment, holders; and they hold as upon a transfer from the person for whom they made the payment, not as upon a transfer from the person they have paid. 4 Ter. Rep. 470. *Espin.* 112.

Thus if the maker of a note, or the acceptor of a bill, be sued by the indorsee, and the bail pay the debt and costs, this absolutely discharges the indorsor, as much as if the principal had paid the note or bill, and the bail cannot afterwards recover against the indorsor in the name of the indorsee. 1 Wils. 46.

An action may be brought upon a non-acceptance against the drawer before the expiration of the time limited by the bill for its payment. *Bull. N. P.* 269. *Doug.* 55.

And all the antecedent parties are liable to the holder, on account of a non-acceptance or non-payment, and if the bill or note

was transferred to him for a precedent consideration by delivery, the person who delivered it is also liable. *Bayl.* 86.

If the holder sues all the persons liable at the same time, it had been supposed that the court or a judge would not stay proceedings in one action, but upon payment of the money recoverable in that, and the costs in such of the rest in which judgment had not been obtained. *Black.* 749. But it has been determined that the acceptor is the only person against whom the plaintiff is entitled to the costs of *all* the actions, and that each of the other parties is entitled to a stay of proceedings upon paying the debt and costs in the action against him. *4 Term Rep.* 691.

But though he may recover judgment in all the actions, he can only once recover the sum payable by the bill or note, and the costs; and if he rejects a tender of such sum and costs, the court will make an order to restrain him from taking out execution. *2 Vez.* 115. *Str.* 515.

If the holder at first sue only some of the persons liable, he may at any time before satisfaction, sue all or any of the rest. *Bayl.* 87.

Obtaining a judgment is no satisfaction even as to the parties subsequent to him, against whom the judgment is obtained, for where to an action against the indorsor of a bill, the defendant pleaded that the plaintiff had recovered a judgment against the drawer, still in force, the court of *King's Bench* on demurrer, held the plea good; but the court of *Exchequer-chamber*, on a writ of error, held otherwise, and the judgment was reversed. *2 Show.* 441. 494. *Lutw.* 882.

And the actual taking of a man in execution, and discharging him upon a letter of licence, is no satisfaction as to any of the antecedent parties. *Black.* 1235.

Nor is it a satisfaction, that one of the parties has been charged in execution, on the bill or note, and discharged as an insolvent, except as to the party at whose suit he was so charged. *4 Term Rep.* 825.

Receiving dividends under a commission of bankrupt, is a satisfaction *pro tanto* only. *Bayl.* 88.

If more than one of the persons liable on account of the non-acceptance or non-payment of a bill or note become bankrupt, the holder may prove, under the separate commissions of each, the full amount of the money due to him upon the bill or note, at the time he makes his proof, and receive dividends under each upon the sums proved, until he shall in the whole have received such amount. *1 Atk.* 109. *2 Vez.* 115. *Cooke's B. L.* 170. But after the receipt of a dividend under one commission, he cannot prove under any of the rest, more than the sum remaining due, after deducting such dividend. *Ibid.* *1 Atk.* 106. *2 Peere Wms.* 89. 409.

So after a partial satisfaction, the holder must not in an action take a verdict for more than the sum remaining due; if he do, the court will either make him correct the verdict, and pay any expence the mistake may have occasioned, or grant a new trial. *1 Hen. Black.* 88. *Coup.* 571.

In an action upon a bill or note, the plaintiff is entitled to recover the money payable thereby, with interest in some cases from the date of the note, as where it appears on the face of it to be for money lent, or is expressed to be payable with interest; but, in general, the holder is entitled to interest from the time it became due, or ought to have been regularly paid, down to the time of final judgment, together with all incidental expences occasioned by the non-acceptance, or non-payment. *Burr.* 1077. *1 Wils.* 105. *2 Term Rep.* 52.

Thus upon a bill or note payable on presentment or demand, interest must be computed from the presentment or demand. *Black.* 761.

But a neglect to procure a protest upon any inland bill, for the payment of 20*l.* upon which a protest might have been made, may, it should seem, preclude the holder from recovering such interest or expences from any person entitled to notice of the non-acceptance or non-payment, from any other person not. *3 & 4 Ann. c. 9. s. 5. Ld. Raym.* 992. *6 Mod.* 80. *Salk.* 131. *Str.* 910. *9 & 10 W.* 3. c. 17.

The only incidental expence, in the case of the person who made the presentment, is the charge of the notice: in the case of any antecedent party, that of the return of the bill or note must be added. *Bayl.* 92.

Upon a foreign bill, the re-exchange forms a part of the expence of the return, and let the bill be returned through ever so many hands, the drawer is liable for the re-exchange upon each return. *2 Hen. Black.* 378.

And the drawer is liable for the re-exchange, and every other expence arising from the non-acceptance or non-payment, notwithstanding the dishonour of the bill is expressly ordered by the country on which it is drawn. *Ibid.*

On the return of a bill drawn here, for the payment of pagodas in the East Indies, the practice is to allow for the sum payable by the bill, interest, and all incidental charges, after the rate of 10*s.* for each pagoda, and 5*l.* per. cent. thereon, from the expiration of 30 days after the bill's dishonour; and it has been determined that this practice was lawful, even where the price allowed for each pagoda, on the discount of the bill, was only 6*s.* 6*d.* *1 Term R.* 52.

Under a commission of bankrupt, the holder of a bill or note is not entitled to any interest or charges accrued or incurred after the commission issued, nor where the act of

bankruptcy, to which the commission relates, is ascertained, to any accrued or incurred after that act of bankruptcy. 1 *Atk.* 140. 2 *Bro. Ch. Ca.* 597.

A bill is *prima facie* evidence of money lent by the payee to the drawer; and a note of money lent by the payee to the maker, and each consequently of money had and received by the drawer or maker to the use of the holder, and of money paid by the holder to the use of the drawer or maker. *Ibid.* and *Ld. Raym.* 758. 12 *Mod.* 380. *Burr.* 1516. 1525.

An acceptance is also evidence of money had and received by the acceptor to the use of the holder, and of money paid by the holder to the use of the acceptor; and an indorsement of money lent by the indorsee to the indorsor. 3 *T. R.* 174, 182. *Bayl.* 96.

VI. *Evidence on bills or notes.* — To recover in respect of a bill or note upon a count for money lent, money paid, or money had and received, the plaintiff must prove such of those facts which are not admitted, which he ought to state upon the usual declaration in special assumpsit; and upon a special assumpsit, he must prove such of the facts which are not admitted, as appear upon the face of that declaration to be necessary. *Bayl.* 114.

An acceptance admits the ability of the drawer to make the bill, and, if made after sight of the bill, his signature: and though it may be a forgery of the drawer's hand, the acceptor is precluded from disputing it afterwards; for it is incumbent on him previously to satisfy himself that it is the drawer's hand. So also an indorsement admits the ability and signature of every antecedent party. *Black.* 390. 1 *Term Rep.* 655.

But an acceptance, though made after sight of an indorsement, does not admit the ability or signature of the indorsor. 1 *Ter. Rep.* 664. *Doug.* 650. 653.

In an action, therefore, against the acceptor of a bill, or maker of a note, the plaintiff must prove the defendant's signature, and the necessary indorsement; and in the former case, if the acceptance was made without sight of the bill, the signature of the drawer in an action against the drawer of a bill, or the indorsor of a bill or note, he must prove the defendant's signature, the necessary indorsements between him and the plaintiff, the presentment, the non-acceptance, or non-payment, and the notice for not giving it. *Bayl.* 116.

In the case of a *foreign* bill, if the plaintiff is bound to prove notice, he must also prove a protest. *Ibid.*

After a transfer by delivery, by a person not entitled to make such transfer, any subsequent holder must prove that either he or some intermediate person between him,

and the person who so transferred it, took the bill or note *bona fide*, and gave a valuable consideration for it. *Ibid.*

A confession of the signature, is sufficient evidence against the party making it, but not against any other party; and it is sufficient though made pending a treaty for a compromise. *Str.* 1051. 1 *Barnes* 317. *Espin.* 145.

In an action against the drawer of a lost bill, *Holt, C. J.* 12 *Mod.* 509., held proof that the defendant owned he had made the bill sufficient. So in an action against an indorsor, proof that the defendant admitted to have received a bill corresponding with that upon which the action was brought, that, after issue joined, he declared that he came to town to hasten the trial of a cause brought against him, on an indorsement he had made upon a bill, and that he carried the case down by proviso, was held sufficient. 1 *Barnard.* 199.

But in an action by the indorsee of a bill against the drawer, proof that one of the indorsors had confessed his signature, is insufficient, and in an action against several drawers, indorsors, or acceptors, an admission upon the pleadings by one of his signature, will not exempt the plaintiff from the necessity of proving it against the others, if they contest it. 1 *Barnes* 317. *Espin.* 125.

The signature of a *partner or servant*, importing to have been made on the partnership or master's account, is to be considered as the signature of the partnership or master. *Ld. Raym.* 175. 1484. *Doug.* 630.

But on a signature by a servant, the servant's authority must be proved. *Bayl.* 119. However, an authority by parol is sufficient, 12 *Mod.* 564. and subsequent assent is evidence of precedent authority. *Comb.* 450. Usual employ is also evidence of a general authority; and a general authority is supposed to continue until its determination is notorious, 12 *Mod.* 346. 10 *Mod.* 110. Therefore, after the discharge of a servant usually employed, a man will be bound by his signature until his discharge is generally known. *Beaves, s.* 251. *Molloy, b. 2. c. 10. s. 27.*

Where a notice is sent by the post, proof of putting it into the post is sufficient. 2 *Hen. Black.* 509. And production of the instrument is sufficient evidence of a protest. 12 *Mod.* 545.

On a judgment by default in an action upon a bill or note, it need not be proved by evidence. *Str.* 1149. *Bayl.* 120.

The court will therefore, upon such judgment, if the bill or note is for the payment of British money, refer it to the proper officer, to ascertain the sum due for principal, interest and charges, and give the plaintiff final judgment without a writ of enquiry; and this is now the constant practice in the King's Bench and Common Pleas, but not

in the Exchequer. 4 Term Rep. 279.
1 Hen. Black. 252. 529. 541.

However, the court will not refer it, if the bill or note is for the payment of foreign money, but leave it to be ascertained on a writ of enquiry. 5 Term Rep. 87.

VII. Defence against bills and notes.—The only species of defence to an action in respect of a bill or note necessary to be mentioned, is that which is founded upon the want of a consideration for giving or transferring it, or an illegality in the consideration upon which it is given or transferred. Str. 647. Bayl. 121.

The debt of a third person, or a debt barred by the statute of limitations, by a discharge under an insolvent act, by a bankruptcy and certificate, or by a composition, is a good consideration. Str. 264. Ld. Raym. 589. 6 Mod. 509. Burr. 2630. Black. 703. Coup. 290.

But if given as the consideration of signing a bankrupt's certificate, or withdrawing a petition against it, or joining in the acceptance of a composition, it is illegal. 1 Hen. Black. 647. 2 Term Rep. 763. 4 Term Rep. 166. 6 Term Rep. 263.

A bill or note given for past seduction will be valid: but for future prostitution, bad. Burr. 1568.

Dropping a criminal prosecution, or suppressing evidence thereon, a recommendation to an office in the king's household, though of a private nature, and not within the stat. 5 & 6 Ed. 3. A smuggling, an usurious or a stock-jobbing contract, is an illegal consideration. 3 Peere Wms. 279. 2 Wils. 349. 1 Bro. Ch. Ca. 114. Black. 445.

So money lost by gaming, (except 9 Ann. c. 14. s. 9. in some part of a royal palace in which the king is then actually resident, the freehold and inheritance of which part is in the crown, and which is not in lease,) or betting on the sides of persons so gaming, money knowingly lent for such gaming or betting, or money lent at the time and place of such play to any person, either then gaming or betting, or who shall, during the play, play or bet, is an illegal consideration. 9 Ann. c. 14. s. 1.

Under this act, cricket, a horse-race, or a foot-race against time, hath been held a game. 1 Wils. 220. but insuring in the lottery, not being known at the time of passing the act, is not. 1 Hen. Black. 29.

No person can insist upon a want of consideration, who has himself received one, nor can it ever be insisted on, if the plaintiff, or any intermediate party between him and the defendant, took the bill or note *bonâ fide*, and upon a good consideration. Bayl. 123.

In those cases in which a defendant might insist upon a total want of consideration, if there really was none, he may shew that the consideration does not extend to all the mo-

ney payable by the bill or note, and the plaintiff shall only recover for the residue. Peake 61.

Wherever the defendant might insist that there was no consent, he may insist that the consideration was illegal: and in those cases in which the legislature has declared that the illegality of the consideration shall make the bill or note *utterly void, frustrate, and of none effect* to all intents and purposes whatsoever, he may insist upon such illegality to defeat the plaintiff's action, though the plaintiff or any of the parties between him and the defendant may have become innocent indorsees, and taken the bill or note *bonâ fide* and given a valuable consideration for it. Str. 1155. Doug. 708. 736.

These cases are, where the consideration is either wholly or in part for signing a bankrupt's certificate, 5 Geo. 2. c. 30. s. 11. Money lost by gaming as aforesaid, or betting on the sides of persons so gaming, money knowingly lent for such gaming or betting, money lent at the time and place of such play, to any person either thus gaming or betting, or who shall, during the play, play or bet. 9 Ann. c. 14. or money lent on an usurious contract. 12 Ann. st. 2. c. 16.

But if at the time of the making the bill or note, the consideration upon which it was accepted or given, was not illegal, any illegality in the consideration upon which it was afterwards transferred or indorsed over, will be no defence, if the plaintiff is an innocent holder *bonâ fide*, and upon a good consideration—therefore where the drawer of a bill for a good consideration, had discounted it with another, who took for the same at the rate of 18l. per cent. discount, and it afterwards came into the hands of the plaintiff, a *bonâ fide* holder: it was held that, although the bill would have been void in the hands of even an innocent holder, yet if it had been originally given on an usurious transaction, the usury in the intermediate transaction on the discount of it, did not make it void in the hands of the plaintiff who was an innocent indorsee. Espin. 274.

And by suffering a judgment by default, the defendant loses the opportunity, if he has any grounds of objecting to the sufficiency of the consideration. 4 Term Rep. 279.

The negotiations of the commercial world being now almost entirely transacted by bills of exchange, we have been more than usually diffuse in our consideration of that subject, in order to establish the principles, to be collected from a long series of determinations, which govern the law of it. Its importance induces us also to add, by way of illustration, some leading cases, many of them recently decided, on the prominent points of the general law.

Acceptance absolute.

Pillans and another v. Van Mierop, Burr. 1663. White drew on the plaintiffs at Rotterdam for 800*l.* and proposed to give them credit upon the defendant's house in London. The plaintiffs paid White's bill, and wrote to the defendants to know, "whether they would accept such bills as they (the plaintiffs) should draw in about a month upon them for 800*l.* on White's credit." The defendants answered, that they would; but White having failed before the month had elapsed, the defendants wrote to the plaintiffs not to draw. The plaintiffs did however draw, and on the defendants' refusal to pay the bills, brought this action. The jury found a verdict for the defendants; but upon an application for a new trial, as upon a verdict against evidence, and two arguments upon it, the court was unanimous that the defendant's letter was a virtual acceptance of such bills as the plaintiffs should draw to the amount of 800*l.* and the rule was made absolute.

Wynne v. Raikes, 5 E. R. 514. A letter from the drawees of a bill of exchange in England, to drawer in America, stated that their prospect of security being improved they shall accept, or certainly pay the bill. This was held an acceptance in law; and this, although the drawees had before refused to accept; and although such letter, written before, was not received till after bill became due.

Clark v. Cock, 4 E. R. 57. A. in consideration of having commissioned B. to receive certain African bills payable to him, drew a bill upon B. for the amount payable to his own order. B. acknowledged by letter the receipt of the African bills, and that A. had drawn for the amount, and assured him that it would meet with due honour from him. This held an acceptance of the bill by B.

Powell v. Jones, Espinasse 17. In an action against the defendant as acceptor of a bill, the only evidence to prove the acceptance was, that when the bill was called for he returned it, and said, "There is your bill, it is all right." Lord Kenyon thought these words could by no implication amount to an acceptance, and non-suited the plaintiff.

And in *Smith v. Nesson, 1 T. R. 269.*, where one requested A. to accept a bill, and to draw upon B. for the same sum, it was held that the mere act of drawing upon B. for such sum did not amount to an acceptance.

Acceptance conditional.

Julian v. Shobrooke, 2 Wils. 9. The defendant accepted a bill to pay, when in cash, for the cargo of the ship *Thetis*; and on being sued, moved in arrest of judgment that a conditional acceptance was not good; but

the court held otherwise, and over-ruled the objection.

Pierson v. Dunlop, Cowp. 571. An answer that the bill would not be accepted till a navy bill was paid, was held a conditional acceptance to pay when the navy bill should be discharged.

Whether an acceptance be absolute or conditional, is a question of law entirely. *Sproat v. Mathews, 1 T. R. 182.*

Acceptance partial.

Wegersloff v. Keene, Str. 214. A foreign bill for the sum of 127*l.* 18*s.* 4*d.* was drawn on the defendant, and he accepted it to pay 100*l.* part thereof; he was sued upon this acceptance, and on demurrer to the replication, insisted that a partial acceptance was not good within the custom of merchants: but the court held it otherwise, and judgment was given for the plaintiff.

Petit v. Benson, Comb. 452. A bill was accepted to be paid half in money, half in bills, and the question was, whether there could be a qualification of an acceptance; and it was proved by divers merchants that there might, for he that might refuse the bill totally might accept it in part, but that the holder was not bound to acquiesce in such acceptance.

Gammon v. Schmall, 5 Taunt. R. 344. If a person, to whom a bill is directed generally, accept it, payable at a particular place, the holder need not receive such qualified acceptance, but might resort to the drawer as for non-acceptance.

Acceptance waived.

Walpole v. Pulteney, cited Dougl. 236, 248. Walpole held a bill accepted by Pulteney, but agreed to consider his acceptance as at an end, and wrote in his bill-book, opposite the entry of this bill, "Mr. Pulteney's acceptance at an end." Walpole kept the bill from 1772 to 1775, without calling upon Pulteney, and then brought this action. The jury found a verdict for the plaintiff; but the court of Exchequer thought the verdict wrong, and granted a new trial, upon which the jury found for the defendant.

Black v. Peele, cited Dougl. 236. 248. Black arrested Peele as acceptor of a bill drawn by Dallas; but on finding that the acceptance was an accommodation one, his attorney took a security from Dallas, and sent word to Peele that he had settled with Dallas, and that Peele need give himself no further trouble, Dallas afterwards became a bankrupt, upon which Black again sued Peele; but it was held that as Black had in express words discharged Peele the action could not be maintained.

Mason v. Hunt, Dougl. 284. 297. Rowland Hunt agreed that his partner, Thomas

Hunt, should, on consignment of a cargo, and an order for its insurance, accept bills for 3600*l*. The cargo was consigned, the order for insurance given, and Thomas Hunt effected the insurance, but he refused to accept the bills; after some negotiation, the plaintiff being the holder, signed a memorandum, by which, after stating that the consignment had been made on account of the bills, and that the Hunts being apprehensive, that the net proceeds might not be sufficient to discharge them, had refused to accept, he accepted the bill of lading and policy, and undertook to apply the net proceeds, when in cash, as far as they would go, to the credit of the payee, in part payment of the bills the plaintiff afterwards sued the Hunts, and insisted that Rowland Hunt's agreement was an acceptance: but after a verdict for the defendant, and time taken to consider upon a rule to shew cause why there should not be a new trial, the whole court was clear, that by the memorandum the plaintiff had waived all right to insist on Rowland Hunt's agreement, for it was obvious that the whole consideration of the acceptance was the consignment, upon which there would be a commission and the policy, and these the plaintiff had taken to himself.

Ellis v. Galindo, B. R. M. 24 Geo. 3., cited *Doughl.* 250. note. James Galindo drew upon his brother for 30*l*. in favour of the plaintiff; when bill became due, James paid the plaintiff 3*l*. 15*s*. 4*d*. and indorsed a promise to pay the remainder in three months. Three years elapsed, and then the plaintiff sued the drawee upon his acceptance. Lord Mansfield thought the defendant discharged, and non-suited the plaintiff. An application was made for a new trial, and "the doubt was whether the question should not have been left to the jury, it being a question of intention arising out of the circumstances." Buller, J. said, "I should have left the question to the jury, but with very strong observations, and as the demand is so small I do not think there ought to be a new trial." Rule discharged.

One A., in June 1811, having agreed to purchase a house of B. for 1000*l*. paying 300*l*. down, full possession to be given by 1st June 1812. B. was arrested in June 1811, on which A. accepted a bill in favour of B.'s creditors, payable if the house should be given up on 1st of June 1812. At B.'s request, A. put his nephew into the house to take care of it, while B. remained in custody. B. having a bad title gave up all claim, and A. purchased it of the real owner, being allowed the 300*l*. he paid to B.; held that the possession which A. had of the house from B. was not such a compliance with the condition of the acceptance, as to support an action against A. *Swann v. Cox*, 1 *Marsh. R.* 175.

Dingwall v. Dunster, *Doughl. R.* 235. Dunster lent Wheate his acceptance, which became due the 13th of December 1774; it was then in the hands of Dingwall, but he finding that Wheate was the real debtor, wrote to his attorney, in February and November 1775, for payment, received interest upon the bill from Wheate, and suffered several years to elapse, without calling on Dunster; on the 13th of February 1775, Dunster wrote to thank Dingwall for not proceeding against him, and said he had been informed by a person Dingwall had sent, that Wheate had taken up the bill; but Dingwall took no notice of this letter; he afterwards sued Dunster, for whom the jury found: but upon a rule to shew cause why there should not be a new trial, the whole court held that there was nothing in the plaintiff's conduct to discharge Dunster; that it meant nothing more than an indulgence to him, and that he would try to recover from the drawer if he could.

Bankruptcy of Parties to Bills or Notes.

Ex-parte Wildman, 1 *Atk.* 109. 2 *Vez.* 113. Wildman held bills drawn by Buckle, and accepted by Vanhylik; Vanhylik failed, and made a composition with his creditors, and Buckle became bankrupt. Wildman having received nothing under Vanhylik's composition, proved his whole debt under Buckle's commission, but before any dividend was made, he received 2*s*. 6*d*. in the pound, out of Vanhylik's estate. Buckle's assignees then contended, that he ought to deduct 2*s*. 6*d*. in the pound out of his proof, and take a dividend upon the balance only; but Lord Hardwicke held, that as the whole sum was due when he proved the debt, and the dividend and composition would not amount to 20*s*. in the pound upon his debt, he was entitled to a dividend upon his whole debt. To the same effect are the cases of *ex-parte Royd*, and *ex-parte Bennett*, cited 2 *Vez.* 114. and see *Cooke's Bankrupt Laws.* 170.

Cooper v. Papy's, 1 *Atk.* 196. The holders of notes drawn by Reeves, and payable to Andree, accepted 6*s*. in the pound from Andree; and Reeves having become bankrupt, the question was, whether they might prove the whole debt under his commission; and Lord Hardwicke held they could not, but that the 6*s*. in the pound must go in discharge of so much of the debt, and they could only prove the remaining 14*s*. The same point was ruled in *ex-parte Ryswick*, 2 *P. Williams* 89, *ex-parte Lefebvre*, 2 *P. Williams* 409. See *Cooke's Bankrupt Laws*, 170.

Considerations Illegal.

Lowe v. Waller, *Doughl.* 708. 736. The defendant was acceptor of a bill, which he gave to Harris and Stratton, upon an usurious contract; Harris and Stratton en-

dorsed it to the plaintiff for a valuable consideration, and the plaintiff had no notice of the usury; upon a case reserved, the question was, whether the usury between Harris and Stratton, and the defendant, was a defence against an indorsee, who took the bill *bonâ fide*, and paid a valuable consideration for it; and after time taken to consider, the court held it was; and though Lord Mansfield expressed a wish that the law should turn out in favour of the plaintiff, the court found the words of the act too strong, and could not get over the case of *Bowyer v. Bampton*, Str. 1155.

Daniel v. Cartony, Espinasse, 274. Scott drew a bill on the defendant, payable to his own order, and discounted it with Greensill, who took 18l. per cent. discount. It was afterwards endorsed to the plaintiff, and defendant could not impeach that transaction; and per Lord Kenyon, "This is no defence; had the note been originally given on an usurious transaction, it would have been void, even in the hands of a *bonâ fide* holder; but usury in an intermediate transaction only cannot make it void in the hands of a *bonâ fide* indorsee."

Webb v. Brooke, 3 Taunt. R. 6. Plaintiff and defendant being taken prisoners in Portugal, jointly solicited, and obtained their liberation, and ransom of defendant's ship, contrary to 45 Geo. 3. c. 72., to effect which plaintiff lent money to defendant, who gave a bill for the amount; held that plaintiff could not recover on this bill.

Scott v. Gilmore, 3 Taunt. R. 226. A bill of exchange, part of the consideration for which was spirituous liquors sold in less quantities than 20s. value, was held totally void *ab initio*, though part of the consideration was money lent.

Cockshutt v. Bennet, 2 T. R. 765. If a note or bill be given, which, being fraudulent, is void in law, no subsequent promise to pay it will raise a consideration which will maintain an action; but if it were only voidable, it may be revived by a subsequent promise.

Thus an action on a note given as an apprentice fee on an indenture which was void, was held not maintainable, in *Jackson v. Warwick*, 7 T. R. 121.

But otherwise, where the indenture was only a voidable one. *Grant v. Welchman*, 16 E. R. 207.

Costs.

Golding v. Grace, Black. 749. The indorsee of a bill obtained a rule nisi to stay proceedings on payment of the debt and costs of the writ; the plaintiff insisted that he was entitled to be paid for both; but the court held that the application to pay debt and costs was made so early that the plaintiff was only entitled to the costs of the writ.

Windham v. Withers, Str. 515. The plaintiff having obtained judgments against

the drawer and indorser of a note, the principal in one, and the costs in both were offered him, which he refused; and the court granted a rule to restrain him from taking out execution, and intimated that they would have punished him, had he taken out execution upon both judgments.

Smith v. Woodcock. Same v. Dudley, 4 T. R. 691. The holder of a bill brought actions against the acceptor, the drawer, and two indorsors: the drawee and one of the indorsors obtained a rule nisi to stay proceedings against them, on payment of the bill and the costs of the actions against them; the plaintiff insisted that the costs of the other actions should be also paid: *sed per Cur.* "That is only necessary where the application comes from the acceptor, who is the original defaulter, and against whom all costs occasioned by his default may be recovered." Rule absolute.

Costs proveable under Bankruptcy.

Anon. 1 Atk. 140. The question was whether the costs and charges incurred by protesting bills after a commission of bankruptcy issued could be proved? And Lord Hardwicke ordered that the costs of the protests arising before the commission, should be proved, but no part of the costs arising afterwards.

Ex-parte Moore, 2 Bro. Cha. Ca. 597. Previously to the 5th of May, 1785, Mrs. Tyler accepted several bills drawn upon her by Moore, and on that day committed an act of bankruptcy, but no commission issued until the 9th of March, 1786; the bills became due between May, 1785, and March, 1786, and Mrs. Tyler not paying them, Moore did; he also paid 298l. for damages and charges, and the interest amounted to 46l. 10s. The commissioners allowed Moore to prove the sums for which the bills were drawn, but would not let him prove the interest, or the sum paid for charges, upon which he petitioned the Chancellor; but the Chancellor held, that as the time when the act of bankruptcy was committed was ascertained, he could not carry the damages beyond that; and the petition was disallowed.

Grace.

Coleman v. Sayer, 1 Barnard, B. R. In an action upon an inland bill, payable six days after sight, one question was, whether three days of grace are allowed, where a bill is payable at certain days after sight, as well as where it is payable upon sight? and Chief Justice Raymond said they were allowable in one case as well as in the other. Another question was, whether they were allowable upon inland as well as upon foreign bills? and the Common Serjeant and foreman of the jury said it was the constant practice in the city to allow them in both cases, upon which Chief Justice Raymond

said he would not alter it; but the plaintiff was non-suited on another point.

The three days' grace are allowed on all promissory notes as well as on bills. *Brown v. Harraden*, 4 T. R. 151. *Smith v. Kendal*, 6 T. R. 123.

Lost Bills, Notes, &c.

Miller v. Race, Burr. 452. A bank-note payable to William Finney, or bearer, was stolen out of the mail, in the night of the 11th December, 1756, and on the 20th came to the hands of the plaintiff, for a full and valuable consideration, in the usual course of his business, and without any knowledge that it had been taken out of the mail; he afterwards presented it at the Bank for payment, and the defendant being one of the clerks stopped it, upon which an action of trover was brought, and upon a case reserved upon the point, whether the plaintiff had sufficient property in the note to entitle him to recover, the court was clear in opinion that he had, and that the action was well brought.

Grant v. Vaughan, Burr. 1516. Vaughan gave Bicknel a draft from his banker, payable to "Ship Fortune or bearer." Bicknel lost it, and the plaintiff afterwards took it *bonâ fide*, in the course of trade, and paid a valuable consideration for it. The banker refused to pay it, upon which the plaintiff brought this action against Vaughan. Lord Mansfield left it to the jury to consider first, whether the plaintiff came to the possession of the bill fairly, and *bonâ fide*: and secondly, whether such draft was in fact and practice negotiable: and the jury found for the defendant. But upon an application for a new trial, and cause shewn against it, the court was clear that the second point ought not to have been left to the jury, because it was clear that such drafts were negotiable, and if the jury thought the plaintiff took the note fairly and *bonâ fide*, of which there appeared to be no doubt, he was entitled to recover. A new trial was accordingly granted, in which the plaintiff recovered the money.

Notice.

In *Russel v. Langstaffe, Dougl.* 497. 515. Lee said arguendo, it had frequently been ruled by Lord Mansfield at Guildhall, that it is not an excuse for not making a demand upon a note or bill, or for not giving notice of the non-payment, that the drawee or acceptor has become a bankrupt, as many means may remain of obtaining payment by the assistance of friends, or otherwise; and Lord Mansfield, who was in court, did not deny the assertion; this dictum was also referred to arguendo in *Bickerdike v. Bollman*, 1 Term Rep. 408.

Blesard v. Hurst and another, Burr. 2670. The defendants inclosed a bill to the plaintiff, and he indorsed it over; his in-

dorse presented it for acceptance a month before it was due, and acceptance was refused; it was afterwards presented for payment, and payment was refused, of which notice was given to the defendants, but they had no notice of the refusal to accept. The drawer was a bankrupt before the bill was due; but he continued in credit three weeks after the presentment for acceptance. Three days after the notice, one of the defendants called on the plaintiff at Bradford, on his way to Leeds, and said he would take up the bill as he returned; but on his return he said he was advised he was not bound to it, upon which this action was brought; and on a case reserved the court held, that though the holder might not have been obliged to present the bill for acceptance, yet, as he did, he ought to have given notice of the refusal, and that by not doing so he had taken the risk upon himself, and, notwithstanding the promise of one of them, the defendants had judgment.

Tindal v. Brown, 1 T. R. 167. A note which became due on the 5th of October was presented at ten in the morning, and the maker not being at home, word was left for him where it lay; the holders sent again on the sixth, when the maker promised to take it up within the banking hours, which were from nine to four; on the seventh the holder sent again to the maker, and the note not being paid, gave notice to the defendant, who was an indorser, but the defendant said he had made it his own; the maker had told him on the sixth that he could not pay it, and desired the defendant would. All the parties lived at Bristol. The jury found for the plaintiff, but upon a rule to shew cause why there should not be a new trial, and cause shewn, the court granted a new trial. Lord Mansfield said, "What is reasonable notice is a question partly of fact, and partly of law; it may depend in some measure on facts, such as the distance at which the parties live, the course of the post, &c.; but whenever a rule can be laid down with respect to this reasonableness, that should be decided by the court, and adhered to for the sake of certainty." Buller, J. "When the post goes out is a matter of fact; when that is established, it is a matter of law what notice is reasonable; as to giving time, the holder does it at his peril, and that is enough to decide the case; the purpose of giving notice is to let the party know that he is looked to for payment, that he may have his remedy over by an early application." Upon the second trial there was contradictory evidence whether the notice from the maker was on the sixth or seventh, and the jury found for the plaintiff, but the court said it was a verdict against law, and granted another new trial.

Saunderson v. Judge. The holder of a note wrote to the defendant, who was one

of the indorsors, to say it was dishonoured, and put the letter in the post; but there was no evidence that it ever reached the defendant, and the court held, that sending the letter by the post was quite sufficient.

Rogers v. Stephens, 2 Term Rep. 715. In an action against the drawer of a foreign bill, an objection was taken that there was no protest; but it appearing that the defendant had no effects in the hands of the drawees when the bill was drawn or afterwards; and that on being pressed for payment by the plaintiff's agent, after the bill was dishonoured, he said it must be paid; Lord Kenyon thought a protest or notice unnecessary, and directed the jury to find for the plaintiff, which they did. A rule was afterwards granted to shew cause why there should not be a new trial, and it was stated *then*, and upon the shewing cause, that the defendant had really been prejudiced by the want of notice to the amount of the bill, that he had advanced money to one Calvert to the amount before the bill was drawn, that Calvert had desired him to draw on the drawees as Calvert's agents, that he did on a supposition that Calvert had effects in their hands, that he afterwards settled with Calvert, and upon a reliance that the bill was paid, delivered him up effects to more than the value of the bill, and that Calvert was since insolvent; that the defendant was prepared with evidence to this effect. All the court thought this answered by the defendant's admission that the bill must be paid, because *that* was an admission that the plaintiff had a resort to him upon the bill, and was a promise to pay. The rule was discharged.

Bickerdike and another, assignees of *Reichard*, v. *Bollman*, 1 Term Rep. 405. The only question upon a case reserved was, whether a bill the bankrupt had drawn in favour of the petitioning creditor, upon a man who then, and from that time till the bill became due, was one of the bankrupt's creditors, had discharged so much of the petitioning creditor's debt, no notice having been given of its dishonour to the bankrupt; and the court, after argument, was of opinion it had not, because the reason why notice is in general necessary is, that the drawer may without delay withdraw his effects from the drawee, and that no injury may happen to him from want of notice; but where the drawer has no effects in the hands of the drawee he cannot be injured, and is not entitled to any notice.

Goodall v. Dolley. In this case, upon an application for a new trial, the plaintiff's counsel offered an affidavit that the drawer had no effects in the hands of the drawee, but the court thought *that* made no difference, the action being brought against the payee. But by Judge Buller: "Had the action been against the drawer, I should have been willing to let in the affidavit;

that would be like the case of *Bickerdike v. Bollman*; if the drawer had no effects in the hands of the drawee, he cannot be injured by want of notice."

De Bert v. Atkinson, 2 H. Bl. 336. In an action against the payee of a note, it appeared that the note was not presented for payment till the day after it became due, and that no notice was given to the defendant till five days after such presentment; but it also appearing that the defendant gave no value for the note, that he lent his name merely to give it credit, and that he knew at the time the maker was insolvent; Chief Justice Eyre directed the jury to find for the plaintiff, which they did. A rule to shew cause why there should not be a new trial was afterwards granted, and upon cause shewn, per Chief Justice Eyre; "If the maker is not known to be insolvent, insolvency will not excuse the want of an early demand; but knowledge excludes all presumption which would otherwise arise; here the money was to be raised upon the defendant's credit; he meant to guarantee the payment, and no loss could happen to him from the want of notice." And Per Buller J.; "The general rule is only applicable to fair transactions, where the bill or note has been given for value in the ordinary course of trade; it is said insolvency does not take away the necessity of notice; that is true, where value has been given, but no further; here the defendant lent his name merely to give credit to the note, and was not an indorser in the common course of business." Heath and Rooke, Justices, concurring, the rule was discharged.

Corney v. Da Costa, Espinasse, 302. *Da Costa and Co.* compounded with their creditors, and to secure the composition, drew notes in favour of the defendant, which he indorsed to the creditors. The defendant took effects of *Da Costa and Co.* at the time to the amount of the composition; and an action being brought against him upon one of these indorsements, he insisted that he had no notice of the non-payment of the note until five weeks after it was due; but Buller J. held he was not entitled to notice, and the plaintiff had a verdict.

Staples v. Okines, Espinasse, 332. In an action against the drawer of a bill the defence was want of notice; the plaintiff thereupon called the acceptor, who proved that when the bill was drawn he was indebted to the defendant in more than the amount of the bill, but that he then represented to the defendant that it would not be in his power to provide for the bill when it should become due, and that it was therefore then understood between them that the defendant should provide for it; and it was contended that this superseded the necessity of giving the defendant notice; but Lord Kenyon held it did not, and non-suited the plaintiff.

Esdaile v. Sowerby, 11 F. R. 114. The indorsors of a bill of exchange had full knowledge of the bankruptcy of the drawer, and of the insolvency of the acceptor, before and at the time when the bill became due; and within a day after, notice might (but for a mistake of the holders) have reached them from the holders, communicating such their knowledge to the bankers of Liverpool, with whom they had discounted the bill, and from whom it had been transmitted to the holders in London, yet held, that did not dispense with such holders giving notice of the dishonour in due time to the indorsors.

Clagg v. Cotton, 3 Bos. & Pull. 239. A. the agent in America of B. residing in England, drew a bill upon him and indorsed it to C., also residing in America, who indorsed it over. Before it became due, A., having reason to think B. would fail, lodged property belonging to B. in the hands of C. to answer the bill in case it should be returned. C. undertook to restore the same whenever he should be exonerated from the bill. Acceptance, and also payment, were refused, but no notice was given to A. It was held that A. was altogether discharged.

Rucker v. Hiller, 16 E. R. 43. Bill of exchange drawn with reasonable expectation of having assets in the hands of drawee, having shipped goods on drawer's account, which were on their way to such drawee, but without bill of lading or invoice. Though the goods had not come to the hands of the drawee when the bill was presented for acceptance, and he returned it marked "no effects," yet the drawer was entitled to notice.

The want of due notice of the dishonour of a bill is answered by shewing the holder's ignorance of the place of residence. Whether he used due diligence to find it out is a question for a jury. *Bateman v. Joseph*, 12 E. R. 433.

Presentment for Acceptance or Payment.

Hoar v. Da Costa, Str. 910. The defendant paid the plaintiff a banker's note at twelve; he put it into the bank at one, and the next morning the runner from the bank carried it with other notes, and left them, as was then usual, to call again for the money; he called at eleven, and was told the banker's servant was gone to the bank; he called again at two, when the banker said he was going to stop, and refused payment, but he paid small notes till four o'clock. The defendant gave notice to the plaintiff the next morning: the question was, whether this note was payment to the plaintiff? It was insisted for the defendant, that if the note had been tendered by itself it would have been paid; and for the plaintiff, that if there had been no demand there would have been no laches, being within the day after the receipt. Chief Justice Raymond said there

was no standing rule, and left it to the jury who found for the plaintiff.

Manwaring v. Harrison, Str. 508. On Saturday the 17th of September, about two o'clock, Harrison gave Manwaring a banker's note, dated the 5th of September, and payable to Harrison or order on demand. Manwaring paid it away the same afternoon to J. S. and he presented it for payment on the Tuesday morning as soon as the shop was open; but the banker stopped payment at that time. Manwaring paid the money to J. S. and brought this action to recover it from Harrison. Chief Justice Pratt left it to the jury whether there had been any neglect, and observed, that as Harrison had kept it eleven days, he probably would not have demanded payment sooner than J. S. did. The jury wished to leave it to the court whether there had been a reasonable time; but the Chief Justice told them they were the judges of that; upon which they found for the defendant, and gave it as their opinion, that a person who did not demand a banker's note in two days, took the credit on himself.

Collins v. Butler, Str. 1087. The maker of a note shut up his house before the note became due, and in an action against the indorsor the question was, whether the plaintiff had shewn sufficient diligence in proving that the house was shut up? and Chief Justice Lee thought not, but that he should have given in evidence that he enquired after the maker, and endeavoured to find him out.

East India Company v. Chitty, Str. 1175. At half past eleven in the morning of the 18th of January, the defendant paid the East India Company's cashier, a banker's note, and they did not send it for payment till the next day at two, at which time the banker stopped payment. The question was, Who should bear the loss? and upon examining the merchants, it was held that the Company had made it their own, by not sending it out the afternoon they received it, or at furthest the next morning, and the jury found accordingly for the defendant.

Nicholson v. Gouthit, 2 H. Bl. 609. Gouthit and Burton undertook to guarantee an instalment on the debts of Greens, and for that purpose Greens drew notes payable to Gouthit, at Drury and Co.'s, which Gouthit and Burton indorsed, after which they were delivered to the creditors. Before they became due, Gouthit enquired at Drury and Co.'s if they had any effects, and on their saying they had not, he desired them to send the notes to him, and he would pay them; many notes were accordingly presented and paid, but the note in question, not being presented till three days after it was due, Gouthit refused to pay it. Burton had supplied him with money to take up all the notes, but as this was not presented when

due, he had returned the money destined to pay it. An action was brought against Gouthit, and upon the trial, Chief Justice Eyre thought, as he knew the note would not be paid at Drury and Co.'s, and had provided money for it, and as his indorsement was by way of guarantee, he was not injured by the delay: but on a rule to shew cause for entering a nonsuit, though justice was clearly with the plaintiff, he thought he could not recover; for though the indorsement was by way of guarantee, it was liable to all the legal consequences of an indorsement, and Gouthit's promise to pay was only to pay such as should be duly presented at Drury's. Heath and Rooke Js. were of the same opinion, and the rule was made absolute.

Mulman v. D'Eguino, 2 H. Bl. 565.—In court on bond conditioned to pay certain bills drawn on India at sixty days after sight in case they should be returned protested, defendant pleaded that they were not presented for acceptance within a reasonable time after the drawing; it appeared that they were drawn on the 5th of March 1793, that they were indorsed on that day by defendant to plaintiffs, who procured them for a house at Paris; that plaintiffs sent immediate advice to the house at Paris, and on receiving their directions on the 30th of April, sent them to India, where they arrived 3d of October; on the 5th of October the holder wrote to the drawee, who was from home, desiring him to accept the bills, and on the 17th of October he sent an answer of refusal; some of the bills were thereupon protested on the 29th of October, and the rest the 18th of November. Chief Justice Eyre left the case to the jury, but told them he thought the bills had been sent to India in time, as they were put up here for negotiation, and were therefore liable to be delayed, and that they were presented in India in time after their arrival. The jury found for the plaintiff, and on a rule to shew cause why there should not be a new trial, and cause shewn, the court was satisfied with the verdict, and the plaintiff had judgment. Chief Justice Eyre said, "The courts have been very cautious in fixing any time for presenting for acceptance an inland bill payable at a certain period after sight, and it seems to me more necessary to be cautious with respect to a foreign bill payable in that manner. The holder is bound to present the bill in reasonable time, in order that the period may commence from which the payment is to take place; but the question, What is reasonable time? must depend upon the particular circumstances of the case; and it must always be for the jury to determine whether any laches are imputable to the plaintiff." Per Buller J. "The only rule I know of which can be applied to the case of bills of exchange is, *that due diligence must be used*. Due diligence is

the only thing to be looked at, whether the bill be foreign or inland, and whether it be payable at sight, at so many days after, or in any other manner. But I think a rule may be thus far laid down as to laches with regard to bills payable at sight, or a certain time after sight, namely, that they ought to be put in circulation; and if a bill drawn at three days sight were kept out in that way for a year, I cannot say there would be laches; but if instead of putting it in circulation, the holder were to lock it up for any length of time, I should say that he would be guilty of laches; but farther than this, no rule can be laid down."

Anderton v. Beck, 16 E. R. 248. Plaintiff living in Yorkshire had received on the 26th of December a bill of exchange payable in London on the 28th, and kept it in his own hands till the 29th, when he sent it by post to his bankers at Lincoln, who duly forwarded it to London for presentment, and the bill was dishonoured. It was held in this case, that the Plaintiff, by keeping it in his hands till the 29th, was guilty of laches, and had made it his own.

Protest.

Leftley v. Mills, 4 Ter. Rep. 170., an inland bill for 20l. 7s. payable 14 days after sight, became due 24th April, 1790. A banker's clerk called with it for payment, in the morning, and the acceptor not being at home, left word where it lay; after six another of the clerks, who was a notary, noted it, and between seven and eight the first clerk went with it again; the acceptor tendered him the amount of the bill, and 6d. over, but he insisted on 2s. 6d. for the noting, and that sum not being paid, an action was brought against the acceptor, who pleaded the tender. Lord Kenyon thought a tender of the amount of the bill, at any time of the day it was payable, was sufficient, upon which the jury found a verdict for the defendant. A rule to shew cause why there should not be a new trial was afterwards granted; and upon cause shewn, Lord Kenyon thought the acceptor had till the last minute of the day of grace to pay the bill, and that it could not be noted or protested till the following day. Buller, J., thought the bills were payable at any time of the last day of grace, upon demand, so as such demand was made within reasonable hours, and that they might be protested on that day. But the whole court concurred that the bill in question could not be noted, because it was payable within a limited time after sight, and the statute authorises the noting of such inland bills only as are payable after date. Rule discharged.

In *Brough v. Parkins*, Ld. Raym. 995. 6 Mod. 80. Salk. 131. Chief Justice Holt says, "A protest on a foreign bill is part of the custom."

Brough v. Parkins, Ld. Raym. 992. 6 Mod.

80. *Salk. 151.* In an action against the drawer of an inland bill, it was insisted upon for error that it did not appear by the declaration that the bill had been protested; sed per Chief Justice Holt, "On an inland bill no protest was necessary by the common law, and the statute does not destroy or take away the party's action, where there is no protest; nor is the want of a protest any bar of the action; but the act seems only to take away from the plaintiff his interest and damages, where he has not made a protest, or to give the drawee a remedy against him, by way of action, for the costs and damages," and the judgment was affirmed.

Harris v. Benson, Str. 910. In an action against the drawer of an inland bill, after an acceptance, Chief Justice Raymond ruled, that for want of a protest, according to 9 and 10 W. 3. c. 17. the drawer could not be charged with interest.

Orr v. Macginnis, 7 E. R. 559. The drawer of a foreign bill of exchange had effects in the hands of the drawee, but took them out previous to the bill becoming due. It was held that a protest for non-acceptance, and notice thereof to the drawer by the drawee was necessary, in order to enable the payee to recover against the drawer; and that it is no excuse for not giving such notice that the drawee had no effects of drawer in hand at the time when bill was refused acceptance if afterwards he had any such effects in hand when the bill was drawn.

A bill of exchange, payable 60 days after sight, becomes due 60 days after acceptance, or after protest for non-acceptance, and may when due be protested for non-payment. *Campbell v. French, in Error, 6 T. R. 200.*

Re-Exchange.

Mellish v. Simeon, 2 H. Black. 578. A bill was drawn in London, upon Paris, and negotiated through Holland; before it became due, the French government prohibited the payment of any bill drawn in England, in consequence of which it was dishonoured, and sent back by the different hands through which it had before been negotiated to London; the re-exchange between Paris and Holland raised the bill from 60*l.* 19*s.* 10*d.* to 90*l.* 15*s.* 9*d.* and the re-exchange between Holland and London, to 91*l.* 14*s.* 3*d.*, which the plaintiff (the payee) paid; and upon an action by him against the drawer, Chief Justice Eyre left it to the jury, whether the defendant was liable for the re-exchange occasioned by returning the bill through Holland; and they found that he was.

An application was made for a new trial, upon the ground that the defendant was not liable for the re-exchange, because there was no default in him, the payment being prohibited by the government of France;

but the court held it immaterial why the bill was not paid: that as it was not paid he was liable to the consequences, of which the re-exchange was one, and the rule was refused.

Auriol v. Thomas, 2 Ter. Rep. 52. Upon executing a writ of enquiry, on a bill for the payment of 800 star pagodas returned protested from India, it appeared that the usage was to charge 10*s.* per pagoda for bills returned from India protested, and five per cent. after the expiration of thirty days from the notice to the defendant, of the bill's dishonour, which included all incidental charges, and that the defendant had agreed to pay accordingly; upon which the jury assessed the damages at 10*s.* per pagoda, with the five per cent., though the plaintiff discounted the bill at the rate of 6*s.* 6*d.* a pagoda; that being then the current price. A rule nisi was obtained, to set aside the inquisition, on the ground that this allowance was exorbitant, and the agreement for it usurious; but the court, on cause shewn, thought otherwise, and discharged the rule.

Transfer of Negotiable Instruments.

Smallwood v. Vernon, Str. 478. In an action against the indorsor of a note, the declaration stated, that he became chargeable according to the tenor of the indorsement; and it was objected that the indorsement might appoint the payment at a time different from that mentioned in the note, sed per Cur. if it did, it would charge the indorsor, for every indorsement is the same as making a new note. *Vide 2 Show. 501. Comb. 52. Skinn. 255, 256. 542. 411. 5 Mod. 87. 12 Mod. 56. Id. Raym. 181. 444. 744. Salk. 125. 132, 133. 3 Salk. 68. Str. 442. 479. 1 Atk. 282. 2 Atk. 102 Burr. 670. 675. Dougl. 615.*

Peacock v. Rhodes, Dougl. 611. 633. A bill was drawn by the defendant, payable to Ingham or order. Ingham indorsed it in blank, after which it was stolen; the plaintiff took it *bonâ fide*, and paid a valuable consideration for it; and acceptance and payment being refused, gave notice to the defendant, and brought this action. A case was reserved for the opinion of the court, and it was contended that this bill was not to be considered as payable to bearer, and that the plaintiff had no better right upon it than the person of whom he took it; but the court said there was no difference between a note indorsed in blank, and one payable to bearer, and the plaintiff had judgment. *Francis v. Mott, N. P. before Lord Mansfield, cited Dougl. 612,* was a similar case, and the Attorney-General, who was for the defendant, after attempting, unsuccessfully, to shew that the plaintiff knew the bill was obtained unfairly, gave up the cause.

Smith v. Clarke, Peake, 225. A bill was

indorsed in blank by the payee, and after some other indorsements was indorsed to Jackson or order; Jackson sent it to Muir and Atkinson, but did not indorse, and Muir and Atkinson discounted it with the plaintiffs; the plaintiffs struck out all the indorsements, except the first, which continued blank. This was an action against the acceptor, and it was objected that the plaintiffs could not recover without an indorsement by Jackson; but Lord Kenyon held otherwise, and the plaintiffs recovered. The plaintiffs afterwards proved that Jackson desired Muir and Atkinson to discount this bill; but Lord Kenyon thought the plaintiff's case made out without this evidence.

Wilmot, J. Burr. 1227. *Blackst.* 299. The payee may check the currency of a bill or note, by giving a bare authority to receive the money, as "Pay to A. for my use," and per Lord Hardwicke, in *Snee v. Prescott*, 1 *Atk.* 249. Bills and notes are frequently indorsed in this manner, "Pray pay the money to my use," in order to prevent their being filled up with such an indorsement as passes the interest.

Anchor v. Bank of England, Dougl. 615. 637. A bill was drawn by the plaintiffs, upon Claus, Heide, and Co. payable to Jans Mæstue or order. Mæstue indorsed it to this effect: "The within must be credited to Captain M. L. Dahl, value on account," and sent it to Claus, Heide, and Co., who credited Dahl for the amount, and gave notice to Dahl, and the plaintiffs, that they had done so; an indorsement, by Dahl, was afterwards forged upon the bill, and the Bank discovered it. Claus, Heide, and Co. having become insolvent, Fulberg paid it for the honour of the plaintiffs; and upon the ground that the indorsement had restrained the negotiability of the bill, they brought an action for money had and received against the Bank. Lord Mansfield directed a nonsuit; but upon a rule to shew cause, why there should not be a new trial, and cause shewn, Lord Mansfield, and Willes and Ashurst, Js., thought the indorsement restrictive, and that the plaintiffs were entitled to recover; but Buller, J., thought otherwise; upon which Lord Mansfield said, the whole turned on the question, Whether the bill continued negotiable? and if they altered their opinion they would mention it again, but it never was mentioned afterwards; and upon a new trial, Lord Mansfield directed the jury to find for the plaintiffs, which they did.

Moore v. Manning, Com. 311. A note was drawn by the defendant, payable to Statham or order: Statham indorsed it to Witherhead, but did not add, "or to his order," and Witherhead indorsed it to the plaintiff. The defendant contended, that as there were no express words to authorise Witherhead to assign it, he had no such

power; but the whole court resolved that as the bill was at first assignable by Statham, as being payable to him or order, and as all Statham's interest was transferred to Witherhead, the right of assigning it was transferred also, and the plaintiff had judgment.

Russel v. Langstaff, Dougl. 496. 514. The defendant, to accommodate Galley, indorsed his name on five copper-plate checks, made in the form of promissory notes, but in blank, without any name, dates, or times of payment being mentioned therein, and delivered them to Galley; Galley filled them up as he thought fit, and the plaintiff discounted them: the plaintiff knew the notes were blank at the time of the indorsement, Galley not paying them when they became due, the plaintiff brought this action. Hotham, B., before whom the cause was tried, was of opinion that as the notes were incomplete when defendant indorsed them, no subsequent act of Galley could make them otherwise, because that would alter the effect of the defendant's indorsement, and he accordingly directed a verdict for the defendant; but upon an application for a new trial, Lord Mansfield said, "Nothing is so clear as the point, the indorsement on a blank note is a letter of credit for an indefinite sum; the defendant said, Trust Galley to any amount, and I will be his security; it does not lie in his mouth to say the indorsements were not regular." A new trial was accordingly granted, and a verdict having been found for the plaintiff in a similar action before Lord Mansfield, the defendant submitted in this without going to a second trial.

In *Crutchley v. Clarence, 2 M. & S.* 90., it was determined, that a bill of exchange drawn and issued in blank, or the name of the payee filled up by a *bonâ fide* holder with his own name, will bind the drawer.

And in *Robertson v. Kensington, 4 Taunt. R.* 30., that if the payee of a bill annex a condition to his indorsement before acceptance, the drawee who afterwards accepts it, is bound by that condition; and if the condition be not performed, the property in the bill reverts to the payee, and he may recover the contents against the acceptor.

Transfer in case of Death.

Rawlinson v. Stone, 3 Wils. 1 Str. 1260. 2 *Burr.* 137. A note was payable to A. B. or order; A. B. died intestate, and his administrator indorsed it to the plaintiff. These facts appearing upon the declaration, the defendant demurred, and contended that the personal representative of the payee had no power to indorse a note; but the Court of Common Pleas, after three arguments, and the Court of King's Bench, upon error brought, were unanimously of opinion that he had; and each court said it was every day's practice, and the constant usage for executors and administrators to indorse bills

and notes, payable to the order of the testator or intestates.

King v. Thomas, 1 Term Rep. 487. The court held, that upon a bill payable to several, as executors, they might sue as executors; and per Judge Buller, no inconvenience can arise from their indorsing the bill; for if they indorse, they are liable, personally, and not as executors; for this indorsement would not give an action against the effects of the testator.

BILL OF LADING, is an acknowledgment signed by the master of a ship and delivered to a merchant, proprietor, or factor of the goods. It contains an account of the articles received on board, and a promise to deliver them in good condition at a certain place, for a specified sum.

These bills of lading are transferrable and negotiable by the custom of merchants. And there is no distinction between a bill of lading indorsed in blank and an indorsement to a particular person. *Lickbarrow v. Mason*, 2 T. R. 65.

A bill of lading is negotiated and transferred by the shipper's indorsement; and when such bill of lading is transmitted from abroad, it is usual for merchants to accept bills in consequence, before the arrival of the goods. *Haille v. Smith*, 1 B. & P. 564.

Where several bills of lading of different import were signed, no reference is to be had to the time when they were signed by the captain; but the person who first gets legal possession of one of them by delivery from the owner or shipper has a right to the consignment; and though there may be a difference on the face of them, if the captain have acted *bonâ fide*, a delivery according to such legal title will discharge him from them all. *Caldwall v. Ball*, 1 T. R. 205.

A freighter of "a ship to Spain or Portugal, or either, as the master should be directed by the freighter or his agents," first ordered the master to proceed to Lisbon, in consequence of which the master had taken in goods and signed bills of lading to that port, could not afterwards countermand that order, and order him to proceed to Gibraltar, without first recalling the bills of lading, or at least tendering sufficient indemnity to the master against the consequences of his liability thereon. *Davison v. Gwynne*, 12 E. R. 381.

The usual clause in a bill of lading engaging the master of the ship to deliver the goods to the consignee or his assigns, *he or they paying freight* for the said goods, is introduced for the benefit of the master only, and not for that of the consignee; and therefore the master is not bound to the consignor to withhold the delivery of the goods unless the consignee or his assigns pay the freight. *Shephard v. Bernales*, 13 E. R. 565.

Bills of lading are made out in sets of three or four, one of which is retained by the

shipper of the goods, another sent *per packet*, to the consignee, the third forwarded to the same *per ship*, and the fourth given to the master of the ship, as his voucher for the goods on board. In the United Kingdom, at least one bill of lading out of every set must be on stamped paper, otherwise the whole are invalid.

The form of a Bill of Lading is as follows:

D. O. } Shipped, by the grace of God, in
1 a 10 } good order and well conditioned,
by John Oakey and Co. in and upon the good ship called the Thetis, whereof is master under God, for this present voyage, Thomas Hinckley, now riding at anchor in the river Thames, and by God's grace bound for New York, that is to say, ten bales of merchandise, being marked and numbered as per margin, and to be delivered in like good order and well conditioned at the aforesaid port of New York, (the king's enemies, dangers of the seas, fire, and every danger and accident of seas, rivers, and navigation whatsoever excepted), unto Messrs. Daniel Oakey and Henry Watkinson, or their assigns, they paying for the said goods per ton freight, with primage and average accustomed. In witness whereof the master of the said ship hath affirmed to three bills of lading of the same tenor and date, one of which being accomplished, the other two to stand void; and so God send the good ship to her desired port in safety. Amen.

(Signed) THOMAS HINCKLEY,
Master of the ship Thetis.

London, 20th Jan. 1818.

The stamp-duties on bills of lading are as follow:

BILL OF SALE, is a solemn contract, under seal, whereby a man conveys or passes away the right and interest which he has in goods or chattels.

All conveyances of lands, goods, and chattels, to avoid the debt or duty of another, shall, as against the party whose debt or duty is so endeavoured to be avoided, be utterly void; except grants made *bonâ fide* upon good and valuable considerations.

If a man make a bill of sale of all his goods, in consideration of blood and natural affection to his son or any other relation, such conveyance shall be void against creditors; and if a man, being indebted to two persons, make a secret conveyance to one of them, of all his goods and chattels, in satisfaction of his debt, but notwithstanding continues in possession, and sells some of them, and sets his mark upon others, this will be fraudulent, and will not prevent another *bonâ fide* creditor from having execution.

The owner continuing in possession after this conveyance is a badge of fraud, as is also a general conveyance of all, without exception, as also a secret manner of transacting such bill of sale; or unusual claims in it, are considered as marks of fraud and collusion.

Bill of Sale of Goods.

Know all men by these presents, That _____ of _____, for and in consideration of the sum of _____, of lawful money of Great Britain, to me in hand, at and before the sealing and delivery of these presents, paid by _____ of _____ (the receipt whereof, I do hereby acknowledge), have bargained, sold, and delivered, and by these presents do bargain, sell, and deliver unto the said _____ viz. _____ and all and singular other the goods, chattels, and effects, of me the said _____ in and about the said dwelling-house (as the case may be), to have and to hold the said bargained and sold premises, unto the said _____, his executors, administrators, and assigns, to the only proper use and behoof of the said _____, his executors, administrators, and assigns, for ever. And the said _____, for himself, his executors and administrators, the said hereby bargained premises, unto the said _____, his executors, administrators, and assigns, against all persons, shall and will warrant, and for ever defend by these presents. In witness, &c.

Sealed and delivered, being }
 first duly stamped, and
 livery and seisin of the
 goods and premises above
 bargained and sold, delivered by the said _____
 giving and delivering the
 said _____, in the name
 of the whole goods and
 premises, in the presence
 of _____.

It is a general rule in the transfer of chattels, that the possession must accompany

and follow the deed; and an *absolute* conveyance of such, without possession, is in law fraudulent, and not merely evidence of fraud. But if the conveyance be conditional, then, indeed, it will not be rendered void by vendor's continuing in possession, till the condition be performed. *Edwards v. Harber*, 2 Ter. Rep. 587.

But a bill of sale made for a valuable consideration, though not accompanied with possession, is valid as against the vendor; and also as against a creditor with whose assent it was given. *Steel v. Brown & Al.* 1 Taunt. R. 381.

BILL OF STORE, is a licence granted by the Custom-house, to merchants, to carry such stores and provisions as are necessary for a voyage, free of duty.

BILLET-WOOD, is small wood for fuel, which must be three feet and four inches long, and seven inches and a half in compass, &c. Justices of peace shall enquire by the oaths of six men of the assize of *billet*, and being under size, it is to be forfeited to the poor. Stat. 43 Eliz. 9 Ann. c. 15.

BILLON, in coinage, a kind of base metal, either of gold or silver, in which copper is the predominant metal. Mr. Bouterroux says, that all gold under twenty-one carats fine, is properly *billon* of gold; and all silver under ten penny-weights, is *billon* of silver.

BILLOT, or **BILLO**, bullion of gold and silver in the mass, before it is coined. *Cowel*.

BILLS OF MORTALITY, are returns which express the numbers of each sex which have died within the period specified. This phrase is used colloquially, and even legally, to designate a certain district, comprehending London and its vicinity, within which these returns are made.

BIND OF EELS, a quantity, consisting of two hundred and fifty; or ten strikes, each containing twenty-five eels.

BING, in the alum-works denotes a heap of alum thrown together, in order to drain.

BINOCULAR TELESCOPE, a kind of dioptric telescope, fitted with two tubes, joined in such a manner, that one may see a distant object with both eyes at the same time.

BIRCH, (GER. *Birke*. DU. *Berke*. DA. *Birk*. SW. *Bürke*, *Bürk*. FR. *Bouleau*. IT. *Betulla*, *Maio*. SP. *Abedul*, *Betulla*. PORT. *Betula*, *Betulla*. RUS. *Beresa*. POL. *Brzoza*. LAT. *Betula*.) a tree universally known in the north of Europe. The wood of the white birch is used for making carriages, and wheels, being hard, and of long duration. In France it is generally used for making wooden shoes, and in Great Britain, for making women's shoe-heels, packing cases, brooms, hoops, &c. It also makes very good fuel, and is planted along with hazel, to make charcoal for forges.

The bark of the birch seems in a manner incorruptible. In Sweden the houses are covered with it, and it lasts many years. It frequently happens that the wood is entirely rotten, when the bark is perfectly sound and good. In Kamtschatka, it is used for making drinking cups. It abounds with a resinous matter, to which its durability is certainly owing. In consequence of this, it is highly inflammable: and in the northern countries torches are made of this bark sliced and twisted together. The bark itself consists of two different substances; a thick brittle brownish red one; and several very thin, smooth, white, transparent membranes; in which the inflammable property resides. The thick part is less resinous, and has a roughish taste.

Upon deeply wounding or boring the trunk of the tree in the beginning of spring, a sweetish juice issues, sometimes in so large a quantity, as to equal the weight of the whole tree and root; one branch will bleed a gallon or more in a day.

This juice is recommended in scorbutic disorders, and other foulness of the blood. Its most sensible effect is to promote the urinary discharge. By proper fermentation, with the addition of sugar, this juice makes a pleasant wine. The bark of the Canada birch is very light, tough, and durable; and the inhabitants of America use it for canoes.

BIRCH-OIL, (GER. *Daggert.* Du. *Berkenöli.* DA. *Birkölje.* Sw. *Björkolja.* Ryssolja. FR. *Huile ou Goudron de bouleau.* IT. *Oleo di betulla.* SP. *Acite de betulla.* PORT. *Oleo de betulla.* RUS. *Degot.* DEGT. POL. *Dziegiel.*) See OIL.

BIRD CAGES, (GER. *Vogelbauer, Kückchen.* Du. *Vogelkooien.* DA. *Fuglebuur.* Sw. *Fogelbur.* FR. *Cages.* IT. *Gabbie.* SP. *Jaulas.* PORT. *Gaiolas.*) are manufactured of iron or brass wire, wicker-work, &c. and having been long principally made in Crooked-lane, on exportation, they are termed Crooked-lane ware.

BIRDLIME, (GER. *Vogelleim.* Du. *Vogellym.* DA. *Fuglelim.* Sw. *Fogellim.* FR. *Glu.* IT. *Pania.* SP. *Liga.* PORT. *Visco.* RUS. *Ptitschei Klei.* POL. *Lep.*) The best birdlime is made of the bark of holly, boiled seven or eight hours in water, till it is soft and tender; then laid in heaps in pits in the ground, and covered with stones, the water being previously drained from it; and in this state left for two or three weeks to ferment, till it is reduced to a kind of mucilage. This being taken from the pit, is pounded in a mortar to a paste; washed in river water; and kneaded, till it is free from extraneous matters. In this state it is left four or five days in another vessel, to ferment and purify itself, when it is fit for use. It may likewise be obtained from the misletoe, the viburnum lantana,

young shoots of elder, and other vegetable substances.

It is sometimes adulterated with turpentine, oil, vinegar, &c.

Birdlime should be of a greenish colour, and sour flavour; gluey, stringy, and tenacious; and in smell resembling linseed oil.

BIRDS' NESTS, (GER. *Indianische Vogelnester.* Du. *Indiaansche Vogelnestjes.* DA. *Indianske fuglereder.* FR. *Nids de Tunchin.* IT. *Nidi di Tunchino.* SP. *Nidos de la China.* PORT. *Ninhos da China.*) the nest of a species of swallow, very much esteemed in China, and throughout all the East Indies, and to be found in Tonquin, and in Cochinchina, but more particularly in the kingdom of Campo or Champa, which is situated between both. Those birds' nests are formed in the same manner as our swallow's nests are, and when a great quantity of them are collected together, they are dried and brought to China for sale. They are principally composed of a gelatinous matter, secreted by the stomach of the bird, and when dissolved in water, form a jelly, considered a great dainty as an article of food.

BIRMINGHAM - WARES, (GER. *Kurze waaren.* Du. *Yzerkramery.* DA. *Isenkramvarer.* Sw. *Järnkram.* FR. *Clinquallerie, Quincailerie.* IT. *Chincaglie.* SP. *Quinquilleria.* PORT. *Quincalharia.* RUS. *Mjelotschnio towarü.*) are all sorts of toys in gold, silver, steel, brass, &c.; buttons, buckles, &c. &c. See *Manufactures of Birmingham*, under the head of EUROPE.

BIRTH, in the sea language, a convenient place to moor a ship in, also a due distance observed by ships lying at anchor, or under sail; and a proper place on board for a mess to put their chests, &c. is called the birth of that mess.

BIS, twice, used in accounts, to denote duplicates of folio, or of accounts.

BISA, BIZA, or BIZE, a coin of Pegu, which is current there for half a ducat. It is also a weight used in that kingdom.

BISMUTH, (GER. *Wismuth.* Du. *Bismuth, Bergsteen.* DA. and Sw. *Vismut.* FR. *Bismuth.* IT. *Bismutte.* SP. *Bismuth, Piedra inga.* PORT. *Bismutho.* RUS. *Wismut.* POL. *Markazyt cynowy.* LAT. *Bismuthum.*) a considerable heavy semi-metal, of a much harder and firmer texture than antimony, not being easily pulverized in a mortar, as that is, though not yielding to the hammer, nor shewing the least token of ductility. It is very susceptible of rust, and in itself is scarcely sonorous, yet mixed with other metals, it adds to their sonorous quality, at the same time that it renders them more brittle; these two properties depending, in a great measure, on the same principles. It is of a fine bright silver colour, and of remarkable structure, being composed of

small fasciæ of plates or laminæ, dispersed irregularly amongst one another. It gives evident tokens, on trial, of a sulphur contained in abundance in it, and after the action of an acid, it lets go a bituminous matter. It requires but an extremely small degree of fire to fuse, melting almost before any other metallic substance, and it is not fixed in the fire, but evaporates with a very moderate degree of heat. It very readily amalgamates with mercury, and has this peculiar quality, that when mixed with other metals in amalgamation with that body, though but in a very small quantity, it makes them run thinner in the amalgama, and occasions a great part of them to be carried through leather, in straining together with the mercury.

Bismuth causes the metals that are difficult of fusion to melt with a much smaller degree of fire than they otherwise would do. It very freely and readily mixes with any metal, and, according to the proportion in which it enters the composition, renders them more brittle, white, and approaching to the nature of the regulus of the semi-metal. But some cautions are to be used in the making of those mixtures; for as the *bismuth* easily burns away, if the matters be difficult of fusion, and require a strong and intense fire, they must be fused before the *bismuth* is added, and the vessel then covered, and the whole kept no longer in the fire, than just while the mixture is made.

Bismuth is very readily dissolved in vinegar, and communicates a saccharine taste to it; it may also be dissolved in the stronger acids, as the spirit of sea-salt, spirit of nitre and aqua fortis; from those solutions in the stronger acids, it is easily precipitated, and forms a fine white powder, called magistery of *bismuth*, much used as a cosmetic.

BISSEXTILE, in chronology, a year consisting of three hundred and sixty-six days, being the same with our leap year.

BISTI, a small coin of Persia; some say it is among the current coins of Persia, and worth only a little above three farthings British; others speak of it again as a money of account.

BISTERE or **BISTER**, (GER. *Bister*. FR. *Bistre*. PORT. *Bistre*.) among painters, denotes a glossy soot, pulverized and made into a kind of cakes, with gum water. It is used to wash their designs. *Bistre* is made by putting soot of dry wood, as beech, into water, in the proportion of two pounds to a gallon, and boiling them half an hour. After the fluid has settled, pour off the clearer part, while it remains hot. Evaporate the fluid to dryness, and what remains is good *bistre*.

BIT, an essential part of a bridle. There are many kinds of bits; the most simple is a short rod of iron, made rather wider than the mouth of the horse, and

provided with a hook or ring at each end, for fastening the reins to. The next is a rod similar to the former, in two pieces, and connected by a joint in the middle; the former is intended for heavy draft horses, the latter for those of light draft. The next is the snaffle, which is provided with two cross pieces that rest against the lips or sides of the mouth: for as the snaffle is intended for the saddle-horse, and the reins go to the hands, so the cross pieces are useful in preventing the bit from being drawn through the month. The number of parts of which the mouth-piece of the snaffle is composed, may be increased to any extent, as it may be made with one, two, or several joints; and hence it acquires new properties and effects which require attention; its gentleness or rigour will depend almost wholly on these conditions.

Another is the curb bit, the mouth-piece of which is usually provided with an upset or arch in the middle, as, if perfectly straight, it would rest upon the tongue, and occasion an unpleasant restraint. It has been sometimes called the liberty bit, on account of the freedom which it allows to the tongue: by others it has been called the porte-mouth bit, vulgarly the *Portsmouth-bit*; and by a supposed opposite expression, we got the *Weymouth-bit*.

BIT, also denotes the iron part of a piercer, augre, and such like instruments used by coopers, carpenters, &c.

BIT, of a key, that part which contains the wards.

BIT, a piece of silver money, current in the British West Indies; value five-pence three-eighths.

BITCHEMARE, a kind of fish, which is salted and dried like cod. It is taken in some places on the coast of Cochinchina, and gives rise to a considerable trade with China.

BITS, or **BITTS**, in ship-building, the name of two great timbers, usually placed abaft the manger, in the ship's loof, through which the cross-piece goes: the use of it is to belay the cable thereto, while the ship is at anchor.

BITTACLE, on ship-board, a square box standing before him that steers the ship, with the compass placed in it, to keep and direct the ship in her course.

BITTER, a sea-term, signifying any turn of the cable about the bits, so as that the cable may be let out by little and little; and when a ship is stopped by a cable, she is said to be brought up by a bitter. Also that end of the cable which is wound about the bits, is called the bitter end of the cable.

BITTER-APPLES. (GER. *Koloquinten*. DU. *Bitterappelin*. DA. & SW. *Coloquinter*. FR. *Coloquintes*. IT. *Coloquintida*. SP. *Coloquintidas*, *Tueras*, *Calabacillas*. PORT. *Coloquintidas*, *Cabacinhas*. RUS. *Kolozintii*.)

POL. *Kolokwintyda*. LAT. *Colocynthidum* (*poma*.) See COLOCYNTHIS.

BITTER, in the salt-works, the brine remaining after the salt is concentered; this they lade off, that the salt may be taken out of the pan, and afterwards put in again; when being farther boiled, it yields more salt. See SALT.

BITUMEN, (GER. *Judenpech*. DU. *Jodenlym*. DA. *Jodebeeg*. SW. *Judebeck*. IT. *Asfalto*. SP. *Asfalto*. PORT. *Asphalto*. RUS. *Asfalt*. POL. *Kley ziemsky*. LAT. *Asphaltum*, *Bitumen judaicum*.) is a tenacious mineral substance, or fossil body, not soluble in water. There are a great number of substances ranked under the general head of *bitumens*; as amber, ambergris, jet, asphaltum, phisaspaltum, pit-coal, mineral pitch and tar, &c. See each under its proper head.

BLACK, German, called also *Frankfort black*, is made with the lees of wine, burnt, washed afterwards in water, then ground in mills made for that purpose, with ivory, bones, or peach-stones, also burnt. It comes from Frankfort, Mentz, and Strassburg, either in lumps or powder; and must be chosen moist, without having been wetted, of a fine black, soft, friable, light, and with as few shining grains as possible. This black is the principal ingredient used by copper-plate printers, for working their engravings.

BLACK-IVORY, otherwise called velvet-black, is burnt ivory or bones, which, becoming quite black, and being reduced to thin plates, are ground in water, and made into troches, to be used by painters, and by jewellers, who set precious stones, to blacken the ground of the collets, and give the diamonds a taint or foil. *Ivory Black* should be chosen tender, friable, and thoroughly ground.

BLACK, *harts'*, that which remains in the retort after the spirits, volatile salt, and oil, have been extracted from hartshorn. It answers the purpose of painters, almost as well as ivory black.

BLACK, *Spanish*, is nothing but burnt cork: it is used in several works. It should be light, and have as few grains of sand mixed with it as possible.

BLACK, *Lamp*, is generally prepared resin or pitch, in iron vessels, then setting fire to it under a chimney, or other place made for the purpose, lined with sheepskins, &c. to receive the vapour or smoke; in this way vast quantities of it are prepared at Paris. In England it is prepared at the turpentine-houses, from the dregs of the resinous matters which are manufactured there, but the greater part of lamp-black is brought from Germany, Sweden, and Norway; where the process, in the preparation is dependent on the manufacturer of common resin. The goodness of lamp-black depends on its lightness, and on the fullness of its colour. It is used on various occasions,

particularly in printers' ink, for which it is mixed with oils of turpentine and linseed. A patent was taken out some years ago, for manufacturing lamp-black from pit-coal, or any kind of mineral and fossil coals.

BLACK, *Currier's*. See CURRYING.

BLACK AMBER, (GER. *Gagat*. DU. *Git*. DA. and SW. *Gagat*. FR. *Jais*, *Jayet*. IT. *Gagata*, *Lustrino*. SW. *Azabache*. PORT. *Azeviche*. RUS. *Gagat*. POL. *Gagatek*. LAT. *Gugas*, *Gagates*.) See JET.

BLACKING, (GER. *Schuhschwärze*, *Wichse*. DU. *Schoenzwartzel*. DA. *Skoesvært*. SW. *Skosvärta*. FR. *Noir* (de cordonnier). IT. *Nero da ugnere le scarpe*. SP. *Negro de zapatos*. PORT. *Negro de sapatos*.) Shoe blacking. This has been an article of no inconsiderable export. It is prohibited by the Russian Tariff of 1816. The usual way of manufacturing it is as follows: Dissolve in 1 quart of hot vinegar 1½ ounce of brown sugar-candy, and let it stand to be quite cold; rub 4 ounces of ivory black with 1 ounce of olive oil in a mortar till quite dry; mix all these ingredients together, and stir them frequently for 24 hours; then add to them (but not before, or it will spoil the whole) 1 ounce of vitriolic acid, and stir the mixture well. Instead of the olive oil, and the vitriolic acid, common vendors of blacking use oil of vitriol, as being a cheap substitute; but it renders the stitches of the shoes rotten, and even in time injures the leather itself.

BLACK LEAD, (GER. *Pottloth*, *Reissbley*. DU. *Potloot*. DA. *Blyant*. SW. *Blyerts*. FR. *Mine de plomb noir*, *Plomb de mine*, *Potelot*. IT. *Miniera di Piombo*, *Piombagine*, *Corezolo*. SP. *Piedra mineral de plomo*. PORT. *Pedra mineral de Chumbo*. RUS. *Tschrrnoi krandasch*. POL. *Otowiek*. LAT. *Plumbago*.) This mineral is found in great abundance, and of very fine quality, at Keswick in Cumberland, as also in many parts of Spain, particularly in the neighbourhood of Malaga; its colour is rather a deep shining bluish grey, than a black, may be diluted a little in the black melting pots. It is smooth, and rather unctuous to touch, and hence is sometimes used for preventing attrition in machines. Acids neither dissolve it, nor alter its colour or unctuousity. It is not found to contain any of the metal from which it receives its name, and its composition appears to be of a singular kind.

Black lead is used in the manufacture of pencils, also for blackening the front of stoves, grates, &c. &c.

Every person who shall unlawfully break into any wad-hole of wad, or black cawke, commonly called black lead, or shall unlawfully take and carry away thence any wad, black cawke, or black lead, or shall aid or employ others so to do, shall be guilty of felony. 25 Geo. 2. c. 10.

BLACK LEAD PENCILS, (GER.

Bleystifte. Du. *Potlootpennen.* DA. *Blyant-spenne.* Sw. *Blyertspennor.* FR. *Crayons noirs.* IT. *Lapis nero.* SP. *Lapiz negro.* PORT. *Lapis negro.* RUS. *Karanaschü.* POL. *Bleyczyk,*) are formed of black lead alone, sawed into slips, which are fitted into a groove made in a piece of wood, and another slip of wood glued over them: the softest wood, as cedar, is made choice of, that the pencil may be the more easily cut; and a part at one end, too short to be conveniently used after the rest is cut away, is left unfilled with the black lead, that there may be no waste of so valuable a commodity. As there is great room for fraud in the pencil-making, persons frequently take the finer pieces of black lead, which they saw into slips, and fix for use in port-crayons.

BLACKWELL-HALL. By Stat. 8 & 9 W. 3. c. 9. s. 1. The governors of Blackwell-hall, and their deputies, shall strictly keep the following times and rules, viz. the public market of *Blackwell-hall* shall be held every Thursday, Friday, and Saturday, from eight o'clock in the forenoon till twelve, and from two in the afternoon till five. The said hours of beginning and ending the said market, shall be known by ringing the market bell in the hall. The same to be continued weekly throughout the year, except days of humiliation or thanksgiving; and the keepers of the hall shall not permit any buying or selling of any woollen cloth at the hall, upon any other days and hours, upon the penalty of 100*l*.

Sect. 2. The said governors, &c. shall appoint to the country clothiers the most convenient room in the hall, for the sale of their cloth, and warehouse for keeping the same, paying the ancient duties of the hall.

Sect. 3. No factor or other person, other than the owner of the cloth, shall sell, or expose to sale, out of the said market of *Blackwell-hall*, any cloth directed to be brought to the said market, or any factor there, upon penalty of 5*l*. for every piece of cloth so sold.

Sect. 4. regulates the hall-keepers, clerks, and master-porters.

Sect. 5. All penalties imposed by this act, may be sued for by actions of debt, &c. one moiety to the king, and the other to the informer.

Sect. 6. If the owner of the cloth neglect to sue for any of the penalties for the space of six months, then any other person may sue for the same, and one moiety shall be to the king, and the other to the informer.

BLACKWELL-HALL FACTOR. Those of this business act by commission from the manufacturers of woollen cloth in the country, but more particularly for the merchants and dealers in cloth in town; to supply them, they contract for large quantities of the various kinds of cloth, in the counties where they are made, which they deposit in *Blackwell-hall*, Basinghall street,

where there are separate places appointed for each factor; and where they sell them to the merchants and retail dealers.

BLADDERS. (GER. *Blasen.* Du. *Blaazen.* DA. *Blærer.* Sw. *Blåsor.* FR. *Vessies.* IT. *Vesciche.* SP. *Vejigas.* PORT. *Bexigas,*) a thin membranous substance, found in several parts of an animal, used by painters, for holding oil, &c. and also by druggists and chemists for a variety of purposes.

BLADE (*Blades,* GER. and Du. *Klingen.* DA. *Klinger.* Sw. *Blader,* *Klingor.* FR. *Lames.* IT. *Lame.* SP. *Hojas.* PORT. *Folhas.* RUS. *Klinki.* POL. *Glownie,*) a thin piece of metal, extended either in length or breadth, beaten with a hammer, or cast into a mould. It is said particularly of that part of a sword, dagger, bayonet, or other offensive weapon, that pricks or cuts. We also say the *blade* of a knife, the *blade* of a razor, to signify that part of those instruments which cuts or shaves. All those sorts of *blades* are of very fine tempered steel, or at least of iron, very well sharpened. The *blades* of Damascus and England are most valued. Those of Toledo are highly esteemed. In England blades are prohibited from being exported.

BLAFART, a small coin current at Cologne, worth something more than a farthing of our money.

BLANC, a small copper coin, which was formerly current in France, for five deniers Tournois. It is now only a money of account; and they still say six blancs, to signify eighteen deniers; but the latter is much more in use than the former.

BLANCHING, in coinage, the operation performed on the planchets or pieces of silver, to give them the requisite lustre and brightness. They also blanch pieces of plate, when they would have them continue white, or have only some parts of them burnished.

Blanching, as it is now practised, is performed by heating the pieces on a kind of peel, with a wood fire, in the manner of a reverberatory, so that the flame passes over the peel. The pieces being sufficiently heated and cooled again, are put successively to boil in two pans, which are of copper: in these they put water, common salt and tartar of Montpellier. When they have been well drained of this water in a copper sieve they throw sand and fresh water over them; and when dry they are well rubbed with towels.

BLANK. Thus merchants and traders call void all unwritten places, which are sometimes left in their waste-book, or journals, which is a very dangerous practice, on account of the ill use that may be made of it. Merchants books are to a certain extent vouchers in courts of justice, because they are supposed to have been written successively from day to day: but as soon as

there is any *blank*, or void space, found in them, were it but two lines, as it sometimes happens at the bottom of a page, the book deserves no longer any credit. Arbitrators appointed to examine merchants' books, ought carefully to observe whether the disputed articles be not set down at the bottom of the pages, which is very suspicious; and in the report they make of the condition in which they found the books delivered to them, they are to declare, whether they found any *blanks* in them or not, and whether there is any probability that there were *blanks* left, which may have been filled up afterwards.

BLANK, is also a piece of paper, at the bottom of which a person has signed his name, the rest being void. *Blanks* are commonly entrusted in the hands of arbitrators or friends, to be filled up as they shall think proper, to terminate any dispute or law-suit. A man must be thoroughly certain of the honesty of those whom he trusts with such a blank.

A *blank letter of attorney* is one in which a void space is left to be filled up with the name of the person who is to act.

A *blank indorsement on bills of exchange*, when one only writes his name on the back of it, leaving an empty space sufficient to write either an order or a receipt.

Blank is also a term used to denote an unfortunate chance in games of hazard, as lotteries, &c.

BLANKETS, a coverlet for a bed: a stuff commonly made of white wool, and wrought in a loom like cloth; with this difference, that they are crossed like serges. When they come from the loom, they are sent to the fuller; and after they have been fulled and well cleaned, they are napped with a fuller's teazle. Blankets made of sheep's wool, are divided into several sorts: of the head and bay wool the widest are made; and narrow ones of the middling and common sort.

There are also blankets made with the hair of several animals; as that of goats, dogs, and others.

There is a great manufactory of blankets about Whitney in Oxfordshire, &c. Blankets may be made in any place where they were used to be made, by stat. 4 Jac. 1. c. 2. s. 16.

Blankets imported into Russia pay a duty of 25 per cent.

BLANQUIL, or **BLANQUILLE**, a small silver coin of Morocco, equal to about two-pence sterling.

BLARE, the penny of Bern in Switzerland.

BLASPHEMY, is an injury offered to God, by denying that which is due and belonging to him, or attributing to him what is not agreeable to his nature. And blasphemies of God, as denying his being, or providence, and all contumelious reproaches of Jesus Christ, &c. are offences by the com-

mon law, punished by fine, imprisonment, pillory, &c. 1 Hawk. P. C. 87.

Likewise by 5 Jac. 1. c. 21. persons jestingly or prophanely using the name of God, or of Jesus Christ, or of the Holy Ghost, or of the Trinity, in any stage play, &c. incurs a penalty of 10*l*.

BLAST, a term used at iron founderies to denote the column of air introduced into the furnace for the purpose of combustion.

BLASTING, a term used by miners, for the tearing up rocks which lie in their way by the force of gunpowder. In order to do this a long hole is made in the rock, which being charged with gunpowder, is filled up; a touch-hole being left, with a train or match to fire the charge.

BLEACHING. This art is naturally divided into two distinct branches; the bleaching of vegetable, and of animal substances. These, being of very different natures, require different processes for whitening them. Vegetables consist of oxygen, hydrogen, and carbon, of which the latter is in the greatest proportion; whilst animal substances, besides these, contain also a large quantity of azote, and also phosphorus and sulphur.

Bleaching of flax and hemp. If ripe flax be examined, it will be found to be composed of fibres or filaments united together by the sap, enveloping a semiligneous substance, and covered with a thin bark. It is the fibrous part only that is used for making cloth, and it must therefore be previously separated from the other matters.

The sap or succulent part is composed of extractive principle and water, and the first process is to separate this substance, which holds the filaments together. As soon as the flax is pulled, it is steeped in soft water until the putrefactive fermentation takes place. This degree of fermentation begins with the succulent part, as being more susceptible of decomposition than the rest. Were the flax to be continued long in this state, the whole substance of it would be decomposed or destroyed, upon the same principle that malt is injured by too long steeping, or that wort loses its substance by too long a fermentation. It must therefore be taken out of the water while yet green, and before the whole of its sap is separated. Well-water and brackish water must be carefully avoided, as well as that which flows over gypseous soil. Such water accelerates putrefaction, and hurts the quality of the hemp and flax.

The flax, when taken from the water, is spread out upon the grass to dry. During the fermentation and decomposition which thence result, there is a speedy combination of oxygen and carbon. Exposure on the grass facilitates the escape of the carbonic acid into the atmosphere, and the plants become of a whitish grey colour.

It is known that a ley very slightly alka-

line may be substituted with advantage, for this long and noxious operation : a chamber from 20 to 50 feet in length, into which the steam of alkaline caustic water, of the strength of one-fourth of a degree only, is introduced, will be sufficient to produce the same effect as watering on an immense quantity of hemp and flax suspended on basket-work, in less time, and with less expense than are required for the different manipulations of watering. The losses occasioned by the negligence of workmen, who, by suffering the hemp and flax to macerate too long, give time to the decomposition to reach the filaments, which renders them brittle, and occasions a considerable waste, will also be avoided. In one process, the artist can follow every moment the progress of his operation, and stop it at the favourable period. Nothing now remains but the wood, and the flax or fibrous part. The wood is a hollow tube, covered over very compactly with the flax. To separate the wood, it must be kiln-dried in order to render it frangible or brittle; but care must be taken not to apply too much heat, for fear of injuring the flax. It is next to be beaten or broken, by which means the flax is not only divided into small fibres, but most of the wood is separated, and the part which adheres is reduced to small fragments. To separate these again, the flax is to be scutched or thrashed, in some small parcels at a time, either by manual labour, or mills contrived for the purpose. Hackling is the last process; which is nothing more than drawing or combing the flax in small parcels at a time, through a pile or group of polished and sharp iron spikes, placed firmly in wood through an iron plate. The spikes are placed pretty close together: the first hackle (for different hackles must be used) is coarse, the second finer, and the third finer still.

The process of hackling answers a double or triple purpose; first, it divides the fibres of the flax, as much as this can be effected by mechanical means; secondly, it separates the minute fragments of wood which escaped the process of scutching; and lastly, it separates the short coarse flax, commonly called tow.

It would appear from the new process of Mr. Lee, who separates the woody matter from the fibre of flax without steeping it, by means of mechanical action, and then bleaches the flax by simply washing it in warm water, that the colouring matter is not chemically united with the fibrous matter, while the plant is vegetating, or after it is pulled, but that the chemical combination takes place while the plant is steeped: therefore such a mode of separating the flax fibre must be a great improvement; as saving the expense of bleaching, and preserving the strength of the linen. This

mode was adopted by Mr. Lee, at Old Bow, on whole fields of flax, with the most perfect success. It was attempted in Ireland, but has not been adopted in that country.

Spinning and weaving are too well known to need description. The linen coming from the loom is charged with what they call the weaver's dressing, which is a paste of flour boiled in water; and as this is brushed into the yarn of the warp before it is woven, it is somewhat difficult to separate it when dry. To discharge this paste, the linen must be steeped in water for about forty-eight hours; when this extraneous substance undergoes a kind of fermentation, which does not extend to the substance of the linen itself, upon the same principle, that the green sap is disengaged from the flax without injury to its texture.

When the linen is well washed after this last process, it contains nothing that water can separate; it is of a greyish white colour, although the fibres of which it is composed, when divested of every adventitious substance, are naturally very white.

The matter which thus colours the linen is of a resinous nature, insoluble in water, and from its intimate union or dissemination through the very fibres of the flax, is difficult of separation, even by those substances which have a solvent power over it. To disengage it, however, in as cheap and expeditious a manner as possible, without injuring the texture of the fabric, is the sole object of the process of bleaching.

Potash is the first menstruum which should be used in bleaching. This is done by adding quick lime to the mild potash, the former having a stronger affinity for the carbonic acid than the latter. But care must be taken not to use the alkaline too strong, otherwise it will attack and destroy the fibrous part. The potash, from its solvent power over the colouring matter, dissolves and separates the part immediately exposed to its action; that is, the parts of it which rest superficially upon the fibres of the flax or thread; for it requires ten or twelve repeated boilings, at least, with the alternate agency of the atmosphere, to separate the whole of the resin.

It might be asked, why such an active solvent as potash should not carry away the whole of the resin at once, or at least as much as it alone could in any way separate? This requires an explanation. What appears to us to be a single ultimate fibre of flax in grey linen, is composed of a bundle of minute filaments closely cemented or agglutinated together by the resinous matter; the potash first used therefore acts only upon the resin of the external coating of filaments; by which means they are loosened or separated, and exposed to the further action of the air. The second boiling in potash opens a second layer, and thus, suc-

cessively, layer after layer, until the whole is divided and opened to the centre. Were the solution of potash sufficiently strong to force its way at once to the centre, it would act upon the filaments themselves, and destroy the texture of the cloth. Each filament, after the process of potash, retains an impregnation of colouring matter, so intimately united, as to resist the further action of it. This can only be removed by the slow and gradual influence of oxygen gas. From the properties of oxygen gas and potash, their manner of operating is very obvious. The oxygen gas dissolves in each boiling a certain quantity of the colouring matter, with which it forms carbonic acid gas, and partly divides the filaments that eluded the action of potash. The carbonic acid gas, from its volatility, flies off and mixes with the atmosphere. Thus alternately, the one dissolving, and the other burning out (for bleaching is slow combustion), the linen is whitened.

Mankind have at all times employed free air as the most convenient menstruum for bleaching. When tired with the slowness of its action, they assisted it by detersive leys, which abridged the process a little : and this union of boiling and exposure on the grass, formed the whole of the ancient art of bleaching. Formerly when it was necessary to bleach cloth, it was customary to immerse it in pure water, to free it from the dressing. This preliminary operation was sometimes hastened by a cold ley ; the cloth was then rinsed in running water, and spread out on a meadow, round which ran a stream of limpid water that served for watering the different pieces. After being exposed in this manner some time, the cloth was washed and boiled in a fresh ley : it was then again spread out on the grass, and this operation was several times repeated, until the required whiteness was obtained. It was still necessary to wind it through soapy water, not only to give it softness and pliability, but to bleach completely the borders, which oppose the longest resistance. It was brought to its ultimate state of whiteness, by drawing it through whey, or diluted sulphuric acid. By this short description it may be seen, that a considerable time was necessary before the absorption of oxygen could take place ; to hasten this operation of nature appeared impossible, until modern chemistry had demonstrated, that oxygen might be extracted, and combined with water, to be afterwards applied to substances where its influence might be necessary. To promote the speedy action of atmospheric air, or rather the oxygenous part of it, in its ordinary elastic state, is well known to be impossible. The oxygenated muriatic acid combined with water, forms the oxygenated muriatic acid gas, which is therefore only a combination of muriatic acid and oxygen ; but this prin-

ciple adheres but weakly to the muriatic acid. All vegetable colours are attacked by this acid, and whitened with more or less celerity, which depends on their greater or less facility of combining with oxygen. The colouring matter undergoes a real slow combustion, which terminates by the formation of carbonic acid, which escaping under the form of elastic fluid, produces what we call bleaching. In whatever manner the oxygenated muriatic acid is procured, it is evident that the oxygen adheres to it only weakly ; and it is on this property that the possibility depends of producing speedily, in manufactories, that action which the atmosphere produces but slowly, and of bleaching in a space of time proportionably short. The oxygenated muriatic acid is employed in four different ways for the purpose of bleaching ; first, in the state of gas alone ; secondly, in the state of gas combined with water, or what is called acid ; thirdly, potash is mixed with the acid to condense the gaseous vapour and destroy its suffocating odour ; fourthly, oxygenated muriates, dissolved in water, are employed. The first method, viz. employing the gas, was never used but for the purpose of experiment ; as the vapour is of so noxious a quality, that to breathe it is fatal, and several people fell a sacrifice to their attempts in employing it. When condensed in water, or in the state of oxygenated muriatic acid, it was found inconvenient in the large way, on account of the expence and difficulty in constructing the necessary apparatus, and the suffocating vapour which escaped.

For the discovery of the oxygenated muriatic acid, its effects on colouring matter, and its inestimable advantages, the arts are indebted to the justly celebrated Scheele. M. Berthollet lost no time in applying this curious and highly interesting substance to the most important practical uses. His experiments of bleaching by oxygenated muriatic acid proved completely successful, and he did not delay to communicate his valuable labours to the public. The new method of bleaching was quickly and successfully introduced into the manufactories of Manchester, Glasgow, Rouen, Valenciennes, and Courtray ; and it has since been gradually adopted in almost all parts of Great Britain, Ireland, France, and Germany. The advantages that result from this method, which accelerates the process of whitening cottons, linens, paper, &c. to a surprising degree, in every season of the year, can be justly appreciated by commercial people only, who experience its beneficial effects in many ways, but particularly in the quick circulation of their capitals.

To save the expence of first preparing the muriatic acid, the usual practice is to mix with the oxyde of manganese muriate of soda or common salt, and sulphuric acid di-

luted with water. The sulphuric acid acts upon the salt, and disengages from it the muriatic acid, which is oxygenated by the oxyde of manganese. The proportions observed when cotton is to be bleached, are, viz.

Manganese	-	30 parts
Common salt		80
Sulphuric acid		60
Water	-	120

For linen cloth the proportions are as follow:

Manganese	-	60 parts
Salt	-	60
Sulphuric acid		50
Water	-	50

The better these substances are combined together, the more easily will the acid gas be disengaged by the action of the sulphuric acid.

It was found, however, that the use of the oxygenated muriatic acid alone weakened the cloth, and various methods of preventing its noxious effects upon the health of the workmen were tried without success: till it was discovered that an addition of alkali to the liquor deprived it of its suffocating effects, without destroying its bleaching powers. The process began then to be carried on in open vessels, and has been continued in this manner to the present period. The bleacher is now able to work his pieces in the liquor, and to expose every part of them to its action, without inconvenience.

Potash was at first used for this purpose; and although this advantage was unquestionably great, it was diminished by the heavy expence of the potash, which was entirely lost. Also the potash which was added to the liquor, though it did not destroy its power of bleaching, diminished it; because a solution of the oxygenated muriate of potash, which differs from this bleaching liquor in nothing but in the proportion of alkali, will not bleach at all. This is a well known fact, from which we might infer, that the oxygenated muriatic acid will lose its power of destroying the colouring matter of vegetable substances, in proportion as it becomes neutralized by potash.

It was afterwards discovered that the oxygenated muriatic acid might be combined with the alkaline earths, as lime and barytes, and also with magnesia; by this means forming oxy muriates, which were soluble in water, and had the property of bleaching. The oxy muriate of lime is at present used in almost all the bleaching-grounds. For the manner of preparing it, Mr. Tennant took out a patent; but this was contested, and determined not to be valid. It is now prepared and used by all the bleachers through the country.

If the oxygenated muriatic acid is passed through lime-water, it will combine with the lime, and form oxy muriate of lime; but

as the water can only retain a small portion of lime, this was not found of much use. To cause a larger quantity of lime to combine with the oxy muriatic acid gas, the lime is mechanically suspended in the water, into which the gas is made to pass, and agitated, so as to present fresh matter to the gas. By this means, the oxy muriate of lime is formed in a very convenient manner; it is dissolved in water, and used as a bleaching liquor.

The oxy muriate of lime, in a dry state, is most commonly used for this purpose, as it can be conveniently transmitted to different parts of the country, and obtained ready prepared at a moderate expence. This is rendered fit for use in the following manner:—Two wine pipes, or any equally large vessels, are placed on end, and a plug inserted into each about ten inches from the bottom. Twenty pounds, or upwards, of the bleaching powder are to be well stirred into this tub; first with a little water, and afterwards it is to be nearly filled. It is then suffered to rest until the insoluble part of the powder falls below the plug-hole. The clear liquor, called the *stock liquor*, is now drawn off. Repeated portions of the powder are used until the insoluble part accumulates to the plug-hole: the other pipe is then used; but instead of pure water, that which has been stirred over the sediment in the former vessel is employed.

The strength of this liquor is determined by means of a graduated glass tube, called the *test-tube*. One part of indigo is dissolved in nine parts of strong sulphuric acid: this solution is to be mixed with 990 parts of water. Of this liquor, a quantity is to be poured into the test-tube, so as to fill it up to O, or the commencement of the scale. The bleaching liquor is then to be dropped gradually in, and mixed with the blue liquor by shaking the tube from time to time, till the blue is changed into a clear brown. As soon as this takes place, the degree of the scale to which the mixture reaches is observed, and the figure marked at that degree indicates the strength of the bleaching liquor; observing that the lowest degree marks the strongest. The liquor, whose strength is thus obtained, is denominated *steep-liquor*, of 1, 2, 3, 4, 5, or 6 degrees.

In all the processes of bleaching which have been hitherto described, we have seen that potash acts a distinguished part, either as an auxiliary, or as a principal agent. To find a detensive substance which might be a substitute for it, was an object of the utmost importance. Mr. Kirwan suspected that it would be found in the sulphuret of lime, and his opinion was confirmed by Dr. Higgins. Sulphur and lime are both cheap articles; they are very easily combined, and this combination completely answers the purposes of potash, without any danger

of injuring the linen. The sulphuret of lime is prepared in the following manner, for the purpose of bleaching: sulphur or brimstone, in fine powder, four pounds; lime, well slaked and sifted, twenty pounds; water, sixteen gallons; these are to be well mixed, and boiled for about half an hour in an iron vessel, stirring them briskly from time to time. Soon after the agitation of boiling is over, the solution of the sulphuret of lime clears, and may be drawn off free from the insoluble matter, which is considerable, and which rests upon the bottom of the boiler. The liquor in this state is pretty nearly of the colour of small beer, but not quite so transparent.

Sixteen gallons of fresh water are afterwards to be poured upon the insoluble dregs in the boiler, in order to separate the whole of the sulphuret from them. When this clears (being previously well agitated), it is also to be drawn off, and mixed with the first liquor; to these again thirty-three gallons more of water may be added, which will reduce the liquor to a proper standard for steeping the cloth. Here we have (an allowance being made for evaporation, and for the quantity retained in the dregs,) sixty gallons of liquor from four pounds of brimstone. Although sulphur, by itself, is not in any sensible degree soluble in water, and lime but sparingly so, water dissolving only about one seven-hundredth part of its weight of lime; yet the sulphuret of lime is highly soluble.

When linen is freed from the weavers' dressing, it is to be steeped in the solution of sulphuret of lime (prepared as above), for about twelve or eighteen hours, then taken out and very well washed. When dry, it is to be steeped in the oxymuriate of lime for twelve or fourteen hours, and then washed and dried. This process is to be repeated six times, that is, six alternate immersions in each liquor, which has been found to whiten the linen.

The use of this substance is, however, objectionable; as if the goods to be bleached contain any metallic substances, they may thus be so firmly united with them, as to occasion much time and trouble for their separation.

Having thus given an account of the general principles of bleaching, we shall particularly describe each step of the process, for the benefit of the manufacturer, who may not be sufficiently versed in the knowledge of chemistry, to apply the above principles with the necessary precision.

The bleaching of linen may be considered as comprising four distinct processes.

1st. To remove the spittle it becomes imbued with in the act of spinning; and the weaver's dressing, which is a paste of flour and water. This, as before mentioned, may be effected by immersing it for a short

period in warm water, or a warm alkaline ley.

2. Immersion in strong alkaline ley. The alkali, universally employed by bleachers in Great Britain, is Russian, or American, potash. There are two methods of employing the alkaline ley, termed *boiling*, and *bucking*. The boiling consists in merely putting the goods in the ley, and letting it boil for a certain time: bucking consists in making the alkaline ley, raised to a boiling heat, pass repeatedly through the goods. There are various ways of doing this, but the following are those most generally practised:

A. The goods are placed loosely in a proper vessel, the ley in the state of boiling is suffered to pass over and run through them; this passes out at the bottom of the vessel, and is returned to the boiler.

B. The alkaline solution is put into a large boiler, having a platform of wood with holes in it, placed a little above the surface of the ley. A pipe is inserted through the middle of the platform, the lower end of which reaches near the bottom of the boiler, the upper as high as the mouth of it. The goods are placed on the platform. The steam from the boiling solution is prevented escaping, by the platform and the goods; it therefore, by its compression, forces the boiling fluid through the pipe. A kind of umbrella is placed above the pipe, which makes the boiling liquid spread all over the goods.

C. Another process is a modification of the last mentioned. The platform and its ascending pipe are placed, not in the boiler, but in a convenient separate vessel. The ley is put into this vessel below the platform; a tube passes into it, which conveys steam from a steam boiler. This raises the heat of the ley to the boiling point; and it is forced through the pipe, and spread over the goods in the manner before mentioned.

The quantity of potash required, will be about one-tenth, or one-twelfth the weight of the goods. It should not be all employed at once, but in three or four distinct portions, to the same goods. The *boiling* is usually continued from four to six hours; the *bucking* until all the liquid is evaporated; which will usually be in five or six hours.

The *third* process, is to expose the goods to the action of the oxygenated muriatic acid prepared in the mode already directed. In conducting this process, it may be observed, that the whole of the solution which may be required, should not be employed on the goods at once. Those which are tolerably white may be steeped in a portion of the solution; after which they may be placed in some fresh: but the solution thus used need not be thrown away; it will do, with the

addition of a little *stock-liquor*, for goods which are not so clean.

One pound of oxymuriate of lime is capable of forming from ten to twelve gallons of liquor of one degree. The quantity required will be, from one-twelfth to one-twentieth of the weight of the goods. It is usual to repeat the process of steeping three times, in which case about $\frac{5}{12}$ of the powder should be employed in the first, $\frac{3}{12}$ in the second, and $\frac{4}{12}$ in the third. The steeping should alternate with the last two boilings or buckings.

Steeping, or immersion of the goods in this liquor, is generally used; but *wincing*, or merely passing them through it, is sometimes adopted in its stead. When wincing is used, a solution two or three times the ordinary strength may be employed.

Immersion is generally continued from six to twelve hours.

The *fourth* process consists in steeping the goods in an acid solution: this is repeated two or three times after the last two or three immersions in the oxymuriate of lime. For this purpose, a quantity of strong sulphuric acid is required, equal to about $\frac{1}{4}$ or $\frac{1}{5}$ the weight of the goods; it is diluted with sixty or eighty times its weight of water; and the steeping is continued from eight to twelve hours.

When linens are intended for printing, they require two or three additional processes in the alkaline ley, and one in acid; and the acid solution is generally used one-third stronger when they are intended for the madella copper.

It may be necessary to observe, that the goods should be washed after each process, and then pressed nearly dry; for this purpose the press of Mr. Bramah is generally employed.

Bleaching of Cotton. Cotton is a filamentous substance, or a kind of down which envelopes the seeds of the cotton plant. This plant or shrub comes originally from the East, and grows only in warm climates. This substance, after being separated from the seeds, is always charged with a coarse colouring matter, which soils it, and renders it opaque. The presence of this unctuous matter is proved by the slowness with which cotton absorbs water before it is scoured, and by the force with which it absorbs it after the operation; by which means, from being opaque, it is rendered clear and transparent. Cotton varies a great deal in its qualities, according to the different kinds, the climate where produced, and the culture employed. Its colour is sometimes yellow, and sometimes white; but in general it is of a dirty yellow.

The same general principles are applied to the bleaching of cotton, as linen. But there is a difference in applying the *second* process. Cotton goods are generally exposed to the action of lime diffused through

water, so as to constitute what is called *milk of lime*. The liquid is heated to 200°, and the immersion continued from four to six hours. Two or three alkaline processes will then, generally, be sufficient. The quantity of potash required will be about $\frac{1}{30}$ the weight of the goods.

In the *fourth* or *acid* process, the quantity of acid required will be about $\frac{1}{60}$ or $\frac{1}{80}$ the weight of the goods; and it may be more diluted than for linen.

Bleaching Wool. We shall here confine ourselves to the examination of wool and silk, as the animal substances most generally employed for clothing.

Wool is a finer kind of hair with which the bodies of several animals are covered. It is composed of filaments or tubes, filled with an oily or medullary substance. The sides of these tubes are perforated with a multitude of small pores, which communicate with a longitudinal tube. By chemical analysis, wool gives a great deal of oil, and carbonate of ammonia; caustic alkaline leys dissolve it entirely. It experiences no change in boiling water; it alters very little when preserved in a place well aired; acids have very little action on it; when exposed to a strong heat it enters into fusion. An examination of these chemical facts, is necessary for understanding the principles which ought to direct the artist in the bleaching of this substance. The little action which acids have upon wool, and its unalterableness in water even when aided by heat, render it necessary to have recourse to alkaline or saponaceous leys; but its solubility in these salts shews, that great prudence and caution must be employed. In regard to acids, none have been hitherto used but the sulphureous acids obtained in the gaseous state by combustion.

In the preliminary operations to which wool is subjected, it is customary to leave a little of its grease, to secure it from insects. Wool is often freed from the grease by the farmers, when they wish to sell it at a high price; but in the subsequent manipulations, it is greased or oiled before it is combed, spun, &c.; and as this fat matter attracts dust, it dirties and thickens the stuffs. The first kind of bleaching to which wool is subjected, is to free it from these impurities. This operation is called *scouring*. In manufactories, it is generally performed by means of an ammoniacal ley, formed of five measures of river water, and one of stale urine; the wool is immersed for about twenty minutes in a bath of this mixture, heated to fifty-six degrees; it is then taken out, suffered to drain, and then rinsed in running water; this manipulation softens the wool, and gives it the first degree of whiteness; it is repeated a second, and even a third time, after which the wool is fit to be employed. In some

places scouring is performed with water slightly impregnated with soap; and indeed, for valuable articles, this process is preferable, but it is too expensive for articles of less value. Fulling the cloth adds still to the whiteness, and if an increased degree be necessary, it may be procured by the action of the sulphureous acid; that is to say, of the fumes of sulphur in a state of combustion, or the vapour of that acid condensed and combined with water.

Sulphuring is generally performed in an arched or very close chamber, constructed in such a manner, that the articles to be exposed to the action of the sulphur can be suspended on poles. The chamber being filled, a certain quantity of sulphur is put in a state of combustion in flat dishes, having a large surface with very little depth; the entrance is speedily shut, and all the interstices around the door are carefully stopped, to prevent the access of the atmospheric air. The acid generated by the combustion of the sulphur, penetrates the stuffs, attacks the colouring matter, destroys it, and effects the bleaching. The stuffs are left in the store some time after the deflagration has ceased. This time varies from six to twenty-four hours. They are then taken out, and made to pass through a slight washing with soap, to remove the roughness they have acquired by the action of the acid, and to give them the necessary softness. This process is imperfect at first, the acid of the sulphur acts only on the surfaces, and does not penetrate. This aerial immersion is not sufficient; the gas cannot introduce itself to a sufficient depth into the stuffs, and the superficies only are whitened. A superior method has been lately invented, which is by making use of the sulphureous acid. The sulphureous acid, or that acid generated by the imperfect combustion of sulphur, differs from the sulphuric acid (oil of vitriol), by its containing less of the acidifying principle.

Sulphureous acid gas unites very easily with water, and in this combination it may be employed for bleaching wool and silk. The sulphureous acid in this state of liquidity, may be prepared by making it traverse water in an apparatus nearly similar to that used for preparing oxygenated muriatic acid. The most economical method of obtaining it, is to decompose sulphuric acid (oil of vitriol), by the mixture of any combustible matter capable of taking from it a part of its oxygen. In exact experiments of the laboratory, when the chemist is desirous of having great purity, it is obtained by means of metallic substances, and particularly by mercury; but for the purpose of which we are treating, where great economy is required, we should recommend the most common substances. We shall therefore give the fol-

lowing process. Take chopped straw, or sawdust, and introduce it into a mattress; pour over it sulphuric acid, applying at the same time heat, and there will be disengaged sulphureous acid gas (vapour of sulphur), which may be combined with water in the apparatus.

The pieces are rolled upon the reels, and are drawn through the sulphureous acid by turning them, until it is observed that the whiteness is sufficiently bright.

They are then taken out, and are left to drain on a bench covered with cloth, lest they should be stained in consequence of the decomposition of the wood by the sulphureous acid; they are next washed in river water, and Spanish white is employed, if it should be judged necessary. This operation is performed by passing the pieces through a tub of clear water, in which about eight pounds of Spanish white have been dissolved. To obtain a fine whiteness, the stuffs, in general, are twice sulphured.

According to this process, one immersion, and reeling two or three hours, are sufficient. Azuring, or bluing, is performed by throwing into the Spanish-white liquor, a solution of one part of Prussian-blue to 400 parts of water; shaking the cloth in the liquid, reeling it rapidly. The operation is terminated by a slight washing with soap, to give softness and pliability to the stuffs. The final operations of dyeing, stretching, pressing, &c. are foreign to the present subject.

Bleaching of Silk. Silk is a semi-transparent matter, spun by a caterpillar, and formed of a substance contained in its body, which becomes hard in the air. This insect inhabits warm climates, being indigenous in Asia; it was naturalized in Europe about the time of the downfall of the Roman empire. The filaments prepared by the silkworm are rolled up in a cod or ball. In this state we find it covered with a yellow varnish, which destroys its brilliancy, and renders it rough. Silk by chemical analysis gives carbonate of ammonia and oil; water at a boiling heat produces no effect upon it; alcohol makes it experience no change; but concentrated-alkaline-leys attack and dissolve it. To give splendour to silk, it must be freed from its varnish. This covering is soluble in alkaline leys. Silk is generally scoured by means of soap, by which it loses one-fourth of its weight. The matter disengaged from it is very fetid, and if the silk is not rinsed in plenty of water, putrid fermentations will take place. Even when the best soap is used, it is generally suspected that it injures the whiteness of the silk. The splendour of the Chinese silk is greater than that of the European, and the Chinese employ no soap in their operations. A slightly alkaline ley will dissolve the varnish of the

silk without using soap, and this has also been effected by the action of boiling water at a very high temperature.

The method which has been used successfully in France is as follows:

Take a solution of caustic soda, so weak as to mark only a fourth of a degree, at most, of the arcometer for salts, and fill with it the boiler of the apparatus for bleaching with steam. Charge the frames with skeins of raw silk, and place them in the apparatus until it is full; then close the door, and make the solution boil. Having continued the ebullition for twelve hours, slacken the fire and open the door of the apparatus. The heat of the steam, which is always above 250° , will have been sufficient to free the silk from the gum, and to scour it. Wash the skeins in warm water; and, having rung them, place them again on the frames in the apparatus, to undergo a second boiling. Then wash them several times in water, and immerse them in water, somewhat soapy, to give them a little softness. Notwithstanding the whiteness which silk acquires by these different operations, it must be carried to a high degree of splendour by exposing it to the action of sulphureous acid gas, in a close chamber, or by immersing it in sulphureous acid, as before recommended for wool.

Bleaching Prints, and printed Books. An application has been made of the new mode of bleaching, to the whitening of books and prints that have been soiled by smoke and time. Simple immersion in oxygenated muriatic acid, letting the article remain in it a longer or shorter space of time, according to the strength of the liquid, will be sufficient to whiten an engraving: if it is required to whiten the paper of a bound book, as it is necessary that all the leaves should be moistened by the acid, care must be taken to open the book well, and to make the boards rest on the edge of the vessel, in such a manner that the paper alone shall be dipped in the liquid: the leaves must be separated from each other in order that they may be equally moistened on both sides. The liquor assumes a yellow tint, and the paper becomes white in the same proportion; at the end of two or three hours, the book may be taken from the acid liquor, and plunged into pure water, with the same care and precaution as recommended in regard to the acid liquor, that the water may exactly touch the two surfaces of each leaf. The water must be renewed every hour, to extract the acid remaining in the paper, and to dissipate the disagreeable smell. By following this process, there is some danger that the pages will not be all equally whitened; either because the leaves have not been sufficiently separated, or because the liquid has had more action on the front margins than on those near the binding. On this account,

the best way is to destroy the binding entirely, that each leaf may receive an equal and perfect immersion; and this is the second process recommended by M. Chaptal.

"They begin," says he, "by unsewing the book, and separating it into leaves, which they place in cases formed in a leaden tub, with very thin slips of wood or glass, so that the leaves, when laid flat, are separated from each other by intervals scarcely visible. The acid is then poured in, making it fall on the sides of the tub, in order that the leaves may not be deranged by its motion. When the workman judges, by the whiteness of the paper, that it has been sufficiently acted upon by the acid, it is drawn off by a cock at the bottom of the tub, and its place is supplied by clear fresh water, which weakens and carries off the remains of the acid, as well as the strong smell. The leaves are then to be dried, and after being pressed, may be again bound up. The leaves may be placed also vertically in the tub; and this position seems to possess some advantage, as they will be less liable to be torn. With this view I constructed a wooden frame, which I adjusted to the proper height, according to the size of the leaves which I wished to whiten. This frame supported very thin slips of wood, leaving only the space of half a line between them. I placed two leaves in each of these intervals, and kept them fixed in their place by two small wooden wedges, which I pushed in between the slips. When the paper was whitened I lifted up the frame with leaves, and plunged them in cold water, to remove the remains of the acid, as well as the smell; this process I prefer to the other.

"By this operation books are not only cleaned, but the paper acquires a degree of whiteness superior to what it possessed when first made. The use of this acid is attended also with the valuable advantage of destroying ink-spots. This liquor has no action upon spots of oil or animal grease; but it has been long known that a weak solution of potash will effectually remove stains of that kind. When I had to repair prints so torn that they exhibited only scraps pasted upon other paper, I was afraid of losing those fragments in the liquid, because the paste became dissolved. In such cases I inclosed the prints in a cylindric glass vessel, which I inverted on the water in which I had put the mixture proper for extracting the oxygenated muriatic acid gas. This vapour, by filling the whole inside of the jar, acted upon the prints, extracted the grease as well as ink-spots, and the fragments remained pasted to the paper."

Easy method of preparing the oxygenated Muriatic Acid.—To oxygenate the muriatic acid, nothing is necessary but to dilute it, and mix it in a very strong glass vessel with manganese, in such a manner that the mix-

ture may not occupy the whole of the glass. Air-bubbles are formed on the surface of the liquor: the empty space becomes filled with a greenish vapour, and at the end of some hours the acid may be farther diluted with water and then used. It has an acid taste, because the whole is not saturated with oxygen; but it possesses all the virtues of the oxygenated muriatic acid. This process may be followed when there is no time to set up an apparatus for distilling, in order to procure the oxygenated acid.

BLOCKS, (GER. *Blücke*. DU. *Blokken*. DA. *Blokke*. SW. *Black*. FR. *Poullies*. IT. *Bozzelli*. SP. *Montones*. PORT. *Moutoes*.) on ship-board, the usual name for what we call pulleys on land. They are thick pieces of wood, some with three, four, or five shivers in them, through which all the running-ropes run. Blocks, whether single or double, are distinguished and called by the names of the ropes they carry, and the uses they serve for. Double blocks are used when there is occasion for much strength, because they will purchase with more ease than single blocks.

BLOCK Engraving. See ENGRAVING.

BLOCK-TIN, pure unmixed tin, of the best quality. See TIN.

BLOND-LACE, (GER. & DU. *Blonden*. DA. & SW. *Blonder*. FR. *Blondes*. IT. *Biondi*. SP. & PORT. *Blondas*.) is manufactured of silk, in imitation of thread lace, and large quantities of it are made in different parts of France and Flanders. See LACE.

BLOOD-STONE, (GER. *Blutstein*. DU. *Bloedsteen*. DA. *Blodsteen*. SW. *Blodsten*. FR. *Pierre Sanguine à crayon*. IT. *Sanguigna*. SP. *Piedra Sanguinaria*. PORT. *Pedra Sanguinaria*. RUS. *Krowowik*. POL. *Krwawnik*. LAT. *Hæmatites*.) or the *lapis hæmatitides*, is a mineral of a reddish colour, hard, ponderous, with long pointed needles. It is found among iron ore in great abundance. These stones are to be chosen of the highest colour, with fine striæ or needles, and as much like cinnabar as possible. Goldsmiths and gilders use it to polish their works, and in medicine it was formerly used to stop bleeding. It is also in use for trinkets.

BLOOD-WOOD, (GER. *Blutholz*. DU. *Bloedhout*. DA. *Blodtræe*. SW. *Blodträ*. FR. *Bois de Sang*. IT. *Legno Sanguigno*. SP. *Palo de Sanguie*. PORT. *Páo Sanguinho*.) See NICARAGUA WOOD.

BLOOM, a mass of iron after having undergone the first hammering, called blomary.

BLOOM RASINS. See RASINS.

BLOTTING PAPER, (GER. *Lösch papier*. DU. *Vloej papier*. DA. *Svøb papier*. SW. *Planpapper*. FR. *Papier brouillard*. IT. *Carta sugante*. SP. *Estraza*, *Teleta*. PORT. *Papel passento* or *Mataborrao*. RUS. *Pro-puzsknaja bumaga*. POL. *Bibicla*. LAT. *Charta emporetica*.) is a paper not sized, and in which

ink readily sinks: it is used in books of accounts, &c. in lieu of sand to absorb ink. It is also used by apothecaries for filtering. See PAPER.

BLOW-PIPE, or *Blowing-pipe*, a hollow tube, used by several artificers: as enamellers, glass-makers, jewellers, &c. It is a wind instrument for the purpose of increasing the heat of a candle or lamp, as common bellows are employed for raising the temperature of a fire or furnace. The blow-pipe is of great use in practical chemistry. The most powerful is that made by Mr. Newman (of Lisle-street, Leicester-square, London), by which a stream of a mixture of oxygen and hydrogen gasses, in a state of compression, is thrown on the object to which its influence is to be applied. It consists of a strong square box of copper, to which an apparatus for condensing the gasses in the box is attached; a bladder is affixed to the extremity of the condensing tube, by a screw-pipe with a stop-cock, for the purpose of supplying the condenser. A jet-pipe with a stop-cock is attached to the upper part of one side the box, through which the gasses issue. They are ignited at the orifice by a taper, and the subject of experiment is here introduced; there is a cylindrical cell made, extending from the top of the box or reservoir, reaching nearly to the bottom of it, and connected with it by means of a safety-valve; a piece of wire gauze terminates the base of the cell or cistern above the valve; and a similar piece is fitted to the top. A little water, to the depth of about half an inch, is placed in the cistern, the ebullition of which forms an index of safety.

BLOWING of Glass, one of the methods of forming the divers kinds of works in the glass manufacture. It is performed by dipping the point of an iron blow-pipe in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown. See GLASS.

BLOWING of Tin, denotes the melting its ore, after being first burnt to destroy the mundic.

BLUBBER, (GER. *Thran*, *Fischtran*. DU. *Thraan*. DA. & SW. *Tran*. IT. *Olio di pesce*. SP. *Grassa*, *Aceite de pescado*. PORT. *Azeite de peixe*. RUS. *Salo worwanno*, *Worwan*. LAT. *Oleum piscinum*.) the fat of whales and other large sea-animals, of which is made train oil. The blubber is the adeps of the animal: it lies under the skin, and over the muscular flesh: it is about six inches in thickness, but about the under lip it is two or three feet thick. See FISHERY; Greenland.

BLUE, (GER. *Blaussel*. DU. *Blaauwzel*, *Blaauw*. DA. *Bla a farve*, *Blau*, *Blausel*. SW. *Blausell*. FR. *Bleu démpois*. IT. *Turchino d' amido*. SP. *Polvos azules*. PORT. *Azul*, *Azul de esmalte*. RUS. *Skorbitlo*. POL.

Lazarus.) likewise called Powder Blue, or Starch Blue. See BLUE MAKERS.

PAINTER'S BLUE is made differently, according to the different kinds of painting. In limning, fresco, and miniature, they use indifferently ultramarine, blue ashes, and smalt: these are their natural blues, excepting the last, which is partly natural and partly artificial. In oil and miniature they also use indigo prepared, as also a factitious ultramarine.

Enamellers and painters upon glass have also blues proper to themselves, each preparing them after his own manner.

BLUE, *Turnsol*, is used in painting on wood, and is made of the seed of that plant: the way of preparing it is to boil four ounces of turnsol in a pint and a half of water, in which lime has been slacked. See TURN-SOL.

BLUE, *Flanders*, is a colour bordering on green, and seldom used but in landscapes.

BLUEING of Metals is performed by heating them in the fire till they assume a blue colour; particularly practised by gilders, who blue their metals before they apply the gold and silver leaf.

BLUE, to dye skins. Boil elder-berries or dwarf elder, then smear and wash the skins therewith, and wring them out; then boil the berries as before in a solution of alum water, and wet the skins in the same manner once or twice; dry them, and they will be very blue.

A BLUE for painting or staining Glass. Take fine white sand twelve ounces, zaffer and minium of each three ounces; reduce them to a fine powder in a bell-metal mortar, then putting the powder into a very strong crucible, cover it and lute it well, and, being dry, calcine it over a quick fire for an hour, take out the matter and pound it: then to sixteen ounces of this powder add fourteen of nitre powder; mix them well together, and put them into the crucible again; cover and lute it, and calcine it for two hours on a very strong fire.

BLUE, *Prussian*. This blue is next to ultramarine for beauty, if it is used in oil: this colour does not grind well in water.

BLUE-BICE is a colour of good brightness, next to Prussian blue, and also a colour of a body, and will flow pretty well in the pencil.

BLUE, *Saunders*, serves as a shade to ultramarine, or the blue-bice, where the shades are not required to be very deep; and is of itself a pleasant blue, to be laid between the light and shades of such a flower as is of a mazarine blue.

BLUE, a fine one from Mr. Boyle. Take the blue leaves of rue, and beat them a little in a stone mortar with a wooden pestle; then put them in water, juice and all, for fourteen days or more, washing them every day till they are rotten; and at last beat them and the water together till they become a pulp,

and let them dry in the sun. This is a fine blue for shading.

BLUE, *Indigo*. This makes the strongest shade of blues, and is of a soft warm colour, when it has been well ground, and washed with gum-water, by means of a stone and muller.

BLUE, *Lacmus* or *Litmus*. This is a beautiful blue, and will run in a pen as freely as ink. It is made of lacmus, and prepared thus. Take an ounce of lacmus, and boil it in a pint of small beer wort, till the colour is as strong as you would have it; then pour off the liquor into a gallipot, and let it cool for use. This affords a beautiful colour, has extraordinary effects, and is a holding colour; if it be touched with aquafortis, it immediately changes to a fine crimson little inferior to carmine.

BLUE, *Japan*. Take of gum-water, what quantity you please, and of white lead a sufficient quantity; grind them well on a porphyry; then take of isinglass size, what quantity you please, of the finest and best smalt a sufficient quantity, mix them well; to which add, of your white lead before ground, so much as may give it a sufficient body; mix all these together to the consistence of a paint.

BLUE-MAKERS, make blue of indigo mixed with cheap materials, for the use of calico-printers, dyers, &c.; but have nothing to do with the fine colours used in painting.

BLUE-VITRIOL. See VITRIOL.

BLUFF-HEAD, among sailors. A ship is said to be bluff-headed that has an upright stern.

BOARD, among seamen. To go aboard signifies to go into the ship. To slip by the board, is to slip down by the ship's side.

Board and Board, is when two ships come so near as to touch one another, or when they lie side by side. To make aboard, is to turn to windward; and the longer your boards are, the more you work into the wind. To board it up, is to beat it up sometimes upon one tack, and sometimes upon another.

"She makes a good board;" that is, the ship advances much at one tack. The weather board, is that side of the ship which is to windward.

BOARDS, (GER. *Breter*. DU. *Borden*. DA. *Bræder*. SW. *Bröder*. IT. *Assi*. SP. *Tablas*. PORT. *Taboas*. RUS. *Doski*. POL. *Deski*. LAT. *Aeas*, *Tabular*.) long pieces of timber, sawed thin for building, and several other purposes. The trees of which boards are chiefly made, are the walnut, beech, oak, fir, pear-tree, and poplar. Deal boards are imported from Memel, Norway, Narva, Stockholm, &c.

BOAT, a small open vessel, commonly wrought by oars.

The structure, and even the names of boats, are different, according to the dif-

ferent uses they are designed for, and the places where they are to be used.

The several boats, and their names, are as follow : A long-boat, a jolly-boat, a skiff, a pinnace, a water-boat, a yawl; the preceding six are boats for ships. Other boats are, a gondola, a Greenland boat, a Bermudas boat, a ballon of Siam, a horse-boat, a periaga, a pleasure-boat, a ponton, a canoe, a cruce, a curry-curry, a deal hooker, a felucca, a ferry-boat, a prau, a flying-prau, a punt, a tilt-boat, a tod-boat, a well-boat, a wherry, &c.

The boats or wherries plying about London, are either scullers, wrought by a single person with two oars, or oars wrought by two persons, with each an oar. All boats rowed with more than four oars, above or below London-bridge, are forfeited.

BOAT, *Life*, a boat invented by one Henry Greathead, of South Shields, for the purpose of preserving the lives of shipwrecked persons. The first was launched in 1799, and so well has it answered, and indeed exceeded every expectation, in the most tremendous broken sea, that since that time many thousand lives have been saved, which otherwise must have been lost; and in no instance has it ever failed.

BOAT-SWAIN, a ship-officer, to whom is committed the charge of all the tacklings, sails and rigging, ropes, cables, anchors, flags, pendants, &c. He is also to take care of the long-boat and its furniture, and to steer her, either by himself or his mate. He calls out the several gangs and companies on board, to the due execution of their watches, works, spells, &c. He is likewise provost-martial, who sees and punishes all offenders sentenced by the captain, or a court-martial of the fleet.

BOB, or *Ball*, is a metallic weight, attached to the lower extremity of a pendulum rod, by means of a tapped adjusting nut, at such a distance from the point of suspension, as the time of a given vibration requires.

BOBBIN, or *Lace Bobbins*, (GER. *Spitzenklöppel*. DV. *Klossen*. DA. *Kniple-stokke*. SW. *Knoppel pinner*. FR. *Fuseaux*. IR. *Marzette*. TRAFUSOLE. SP. *Bolillos*. PORT. *Bilros*. RUS. *Bokliuschki*) a small piece of wood turned in the form of a cylinder, with a little border jutting out at each end, bored through to receive a small iron pivot. It serves to spin with the spinning-wheel, or to wind thread, worsted, hair, cotton, silk, gold, and silver.

BOCAL, or *Boccale*, a liquid measure used at Rome. It is equal to about half a gallon (English) wine measure.

BOCKING, or *Bokking*. Thus they call in Holland, what we call red-herring in English; and the French *hareng fumé*, or *sorot*, smoked herring.

BOHEA, black tea, which comes from China. See **TEA**, and **ASIA**.

BOLE-ARMENIAC, is an earthy substance of a pale yellowish colour, inclining somewhat to red. It is ponderous, pinguious, easily friable, and of a styptic taste. It is found in the mines in Turkey, and thence brought to us. The only use of the Bole-Armeniac at present, is as a coarse red ingredient, for which purpose it is calcined and levigated, and is sold in Germany under the name of Berlin, or English red.

BOLLITO, a name by which the Italians call a sea-green colour, or artificial crystal. To prepare this colour, you must have in the furnace a pot filled with forty pounds of good crystal, first carefully skimmed, boiled, and purified, without any manganese: then you must have twelve ounces of the powder of small laves of copper, thrice calcined; half an ounce of zaffer, in powder; mix them together, and put them at four times into the pot, that they may the better mix with the glass; stirring them well each time of putting in the powder, for fear that it should swell too much and run over.

BOLLOS, in the mines of Peru, a denomination given to the ingots or bars of silver procured there from the ore, by the operation of fire, and the use of aquafortis.

BOLOGNIAN STONE, is a kind of mineral stone, found near Bologna, which when duly prepared by calcination, makes a species of phosphorus. The property of this stone is, that though it has no lucid appearance in the dark, until it undergoes a particular calcination, it becomes capable, by previous preparation, of imbibing, when exposed for a few minutes to the light of day, or even the flame of a candle, such a quantity of light, that it afterwards shines in the dark for several minutes, like a glaring coal, but without any sensible heat.

BOLSTERS, in the sea language, small cushions, or bags filled with tarred canvas, or rope-yarn, &c. and placed under the shrouds and stays, to prevent their chafing against the trestle-trees, by the motion of the mast, when the ship rocks at sea.

BOLT, among builders, an iron fastening fixed to doors and windows. Bolts are generally distinguished into three kinds, viz. plate, round, and spring bolts.

BOLTS, in a ship, are iron pins, of which there are several sorts, according to their different makes and uses. Such as *drive bolts*, used to drive out others: *ray bolts*, with jags or barbs on each side, to keep them from flying out of their holes: *clench bolts*, which are clenched with rivetting hammers: *forelock bolts*, which have at the end a forelock of iron, driven in to keep them from starting back: *set bolts*, used for forcing the planks, and bringing them close together: *fend*, or *fender bolts*, made with long and thick heads, and struck into the uttermost bents of the ship, to save her sides from bruises: and *ring bolts*, used for

brinking to the planks, and those parts whereto are fastened the breeches and tackles of the guns.

BOLT of *Canvass*, is the quantity of 28 ells.

BOMB, in the military art, a hollow iron ball or shell filled with gunpowder, and furnished with a vent for a tube filled with combustibles, to be thrown out from a mortar.

BOMBAZINE, a kind of silk stuff originally manufactured at Milan, and thence sent into France and other countries. Since the finest wools have been encouraged in Great Britain, it is in no place manufactured better, or in larger quantities than in this kingdom.

BOMB-KETCH, a vessel carrying two ten inch mortars, four sixty-eight pounders and six eighteen pound carronades; and the mortars may be fired at as low an angle as 20 degrees: their principal use being to cover the landing of troops, and to protect our coasts and harbours. A bomb-ketch is from 60 to 70 feet long and draws eight or nine feet water.

BOND, a bond, or obligation, is a deed whereby the obligor, or person bound, binds himself, his heirs, executors, and administrators, to pay a certain sum of money, or do some other act; and there is generally a condition added, that if he do perform such act, the obligation shall be void, or else remain in full force; as performance of covenants, standing to an award, payment of rent, or re-payment of a principal sum of money with interest, which principal sum is usually half the sum specified on the bond. 2 *Black*. 340.

All persons who are enabled to contract, and whom the law supposes to have sufficient freedom and understanding for that purpose, may bind themselves in bonds and obligations. 1 *Roll. Abr.* 340.

But if the condition of a bond is impossible, at the time of making it, if it is to do a thing contrary to some rule of law, or to do a thing that is *malum in se*, the obligation itself is void. The bond of a feme covert is void, as is that of an infant. If a person is illegally restrained of his liberty, and during such restraint enters into a bond to a person who causes the restraint, the same may be avoided for duress of imprisonment. 2 *Inst.* 482.

To avoid controversies, three things are necessary to making a good obligation, signing, sealing, and delivery.

Interlineations or erasures, if in a material part, will render a bond void.

If several days are appointed for payment of money in a bond, the obligation is not forfeited, nor can be sued until all the days are past.

By 4 Ann. c. 16. "if at any time pending an action upon any bond with a penalty, the defendant shall bring into court where

the action is depending, all principal money and interest due on such bond, and also all such costs as have been expended in any suit or suits in law or equity upon such bond, the said money so brought in shall be deemed and taken to be in full satisfaction and discharge of the said bond; and the court shall and may give judgment to discharge every such defendant of and from the same accordingly." sect. 14.

An example of a common bond of the simplest kind, will be sufficient for illustration, and more than that would only lead to experiments, which might be dangerous to the parties making them.

Bonds from one or more Obligors to one or more Obligees.

Know all men by these presents, That I (we), A. B. of, &c. (C. D. of, &c. and so on, if more obligors) am (are) held and firmly bound to E. F. &c. (and G. H. of, &c. and so on, if more obligees) in ——— pounds, (double the condition) of lawful money of Great Britain, to be paid to the said E. F. (G. H. &c. if two obligees, add or either of them; but if three or more, say, or any of them) or his (their) certain attorney, executors, administrators, or assigns, for which payment, to be well and truly made, I (we) bind myself (ourselves and each of us, by myself), my (our and either of our, when two; or our and every of our, when three) heirs, executors, and administrators, firmly by these presents, sealed with my (our) seal (seals), dated the ——— day of ———, in the ——— year of the reign of our Sovereign Lord, George the ———, by the grace of God, of the United Kingdom of Great Britain and Ireland, King, Defender of the Faith, &c. and in the year of our Lord ———.

The condition of this obligation is such, that if the above bounden ———, his heirs, executors, or administrators, do and shall well and truly pay, or cause to be paid, unto the above-named ———, his executors, administrators, or assigns, the full sum of ———*l.* of lawful money of the United Kingdom of Great Britain and Ireland, current here in England, with interest for the same, at and after the rate of 5*l.* per cent. per annum, on the ——— day of ——— next ensuing, the date of the above-written obligation, without fraud or further delay; then this obligation to be void: otherwise to remain in force, virtue, and effect.

Sealed and delivered, being first }
duly stamped, in the presence of }

An obligation is good though it wants a date, or hath a false or impossible date; for the date is not of the substance of the deed; and the day of the delivery of deed or obligation is the day of the date, though there is no day set forth. 2 *Co.* 5.

86. *Hob.* 249. *Stil.* 97. *Cro.* *Jac.* 156.
264. *Yelv.* 195. 1 *Salk.* 76.

If A. and B. enter into a bond, and set but one seal to it, and A. execute it for himself and B., with the authority and in the presence of B., it is obligatory on both. *Sir W. Jones*, 268. 4 *Term Rep.* 515.

It is to be observed that the condition of a bond must be to do a thing lawful; and therefore bonds restraining trade in general in any part of the kingdom, are unlawful and void, for they are against the good of the public, and the liberty of a freeman, and tend to a monopoly; but a condition, restraining a man from exercising a particular trade in a certain place, or within certain limits, if done fairly, and upon a good and lawful consideration, is good. 1 *Bac. Abr.*

Conditions of bonds are to be not only lawful but possible; and when the matter or thing to be done, or not to be done by a condition is unlawful, or impossible, or the condition itself repugnant, insensible or uncertain, the condition is void, and in some cases the obligation also. 10 *Rep.* 120. But sometimes an obligation may be single, to pay the money, where the condition is impossible, repugnant, &c. 2 *Mod.* 285. If a thing be possible at the time of entering into the bond, and afterwards becomes impossible by the act of God, the act of the law, or of the obligee, it is become void; as if a man be bound to appear next term, and dies before, the obligation is saved. *Co. Lit.* 206.

Thus a condition of a bond was, that A. L. should pay such a sum upon the 25th of December, or appear in Hilary term after in the court of B. R.; he died after the 25th of December, and before Hilary term, and had not paid any thing: in this case the condition was not broken for non-payment, and the other part is become impossible by the act of God. 1 *Mod. Rep.* 265. And when a condition is doubtful it is always taken most favourably for the obligor, and against the obligee.

Beside bonds to secure the payment of money, there are bonds of surety and indemnity, and these are so diversified, according to the subject matter, that it is impracticable here to do more than offer a few recently decided cases on the most common and important occurrences relating to this general title.

A. gave B. a bond to secure an annuity, and before any payment became due, A. lent B. a sum of money; on which it was agreed that B. should retain the payments of the annuity as they became due till that sum was discharged. Then B. became bankrupt: the agreement to retain was held a good plea to an action on the bond by B.'s assignees for the payments accruing after the bankruptcy. *Sturdy v. Arnold.* 3 *T. R.* 599.

To action of debt on bond, the defendant pleaded, that the bond was given to secure payment of the price of goods agreed to be

sold and delivered in London by plaintiff to defendant, to be by the latter shipped to Ostend, and thence re-shipped to the East Indies, and there trafficked with clandestinely. Held a sufficient bar to the action, as being within stat. 9 Geo. 1. c. 21., which avoids contracts for supplying cargoes for foreign ships engaged in such a trade. *Lightfoot v. Tenant.* 1 *Bos. & Pull.* 551.

A bond with a condition that a clerk shall faithfully save and account for all monies, &c. to the obligee and his executors, does not make the obligor liable for money received by such clerk in the service of the executors of the obligee who continue the business, and retain the clerk in the same, with other employment. *Parker v. Barker.* 1 *T. R.* 287.

But such bond is not discharged by the obligees taking in another partner, but they may recover money received by such clerk after taking in such partner. *Bartlay v. Lucas.* 1 *Term Rep.* 291.

And a bond given to trustees to secure the faithful services of a clerk to a company, may be put in force notwithstanding the individuals of such company may have been charged, so as to be no longer a body consisting of the same persons. *Metcalf Bart. v. Bruin.* 12 *E. R.* 400.

The conditions of an indemnity bond may be restrained by the recitals, though the words of the condition import a larger liability than the recitals contemplate. *Pearsall v. Somers.* 4 *Taunt. Rep.* 595.

BOND, *post obit*, one and the main condition is, that it only becomes payable after the death of some person, whose name is therein specified. They are, at best, securities of a very doubtful nature. *Lushington v. Waller.* 1 *H. B.* 95.

BOND, in carpentry, is fastening two or more pieces together either by tenanting, mortising, or dovetailing, &c.

BOND, in masonry and bricklaying, is when bricks or stones are so interwoven, that the joints are not made over or upon other joints, but reach at least six inches both within the wall and on the surface, as the art of building requires.

BONE - BLACK, (GER. *Knochenschwarz.* DU. *Beenzwart.* DA. *Beensvarte.* SW. *Benswart.* FR. *Noir d'os.* IT. *Nero d'osso.* SP. *Negro de hueso.* PORT. *Negro de osso.*) a sort of ivory-black made from burnt bones. See BLACK.

BONE-LACE, (GER. *Kluppelspitzen.* DU. *Kanten.* DA. *Kniplinger.* SW. *Spetsar.* FR. *Dentelles (au fuseau).* IT. *Merletti.* MERL. SP. *Encajes.* PORT. *Rendas.*) a thread lace manufactured in different parts of France and Flanders, with bones on a cushion, instead of bobbins, whence it takes its name. See LACE.

BONNET, in a ship, are small sails, fastened or laced to the bottom of the mainsail and fore-sail, in light winds, to make them larger.

BONTANS, a kind of stuff or covering, the ground being cotton interwoven in stripes with red worsted, fabricated at Cantor on the river Gambia, and forming an article of commerce, being bought up by the Europeans, who exchange them for other commodities with the inhabitants of the other coasts of Africa.

BONTIA, the wild olive of Barbadoes. This species is generally cultivated in the gardens at Barbadoes, for hedges, for which it is exceedingly proper, being an ever-green of very quick growth.

BOOK, BOOKS, (GER. *Bücher*. DU. *Boeken*. DA. *Bøger*. SW. *Böcker*. FR. *Liures*. IT. *Libri*. SP. *Libros*. PORT. *Livros*. RUS. *Knigi*. POL. *Książki*, *Księgi*. LAT. *Libri*.) a writing or treatise on some branch of literature, composed for the instruction or amusement of the reader. The term is likewise applied to blank books, such as account and memorandum books sold by stationers, &c.

By 25 Hen. 8. c. 15. none shall buy, to sell again, printed books, ready bound, imported from beyond sea, under penalty of 6s. 8d. a book, and none shall buy any books by retail, imported by any stranger, under the like penalty.

By 5 and 4 Edw. 6. c. 10. popish books, missals, legends, and antiphoners, shall be abolished.

By 17 Car. 2. c. 4. a printed copy of every book shall be sent to the king's library, and to each of the two universities.

University printers shall deliver one copy of books printed there to the king's library, and to the vice-chancellor of each university, and two others for the public libraries there, on pain of 5*l.* each book. *Ibid.*

By stat. 7 Ann. c. 14. s. 10. if any book shall be taken, or otherwise lost out of any parochial library, any justice may grant his warrant to search for it; and if it shall be found, it shall by order of such justice be restored to the library.

By 8 Ann. c. 19. authors of books and their assigns shall have the sole right of printing them for fourteen years from the day of publishing; and others printing the same without their consent, shall forfeit the books, and one penny for every sheet.

The titles of copies shall be entered before publication, in the register-book of the company of stationers, for inspection; the clerk of the company shall give a certificate thereof for sixpence. *Ibid.*

Nine copies of each book shall be delivered to the warehouse-keeper of the company of stationers, for the use of the royal library, the libraries of Oxford and Cambridge, the libraries of the four universities in Scotland, of Sion College, and the library of the advocates at Edinburgh, within ten days after demand, on pain to forfeit the value of the books, and 5*l.* *Ibid.*

This act shall not restrain the importing

of books in Greek, Latin, or any foreign language, printed beyond sea; nor extend to the right of the universities. *Ibid.*

The general issue may be pleaded by defendants, having acted under this act. *Ibid.*

After the first fourteen years the right of printing shall return to the author, if living, for other fourteen years. *Ibid.*

The author of any pamphlet shall lose all property therein if the stamp-duties are not paid; and they shall have the printer or publisher's name thereon, on pain of 20*l.* *Id.*

By 12 Geo. 2. c. 36. the penalty of 5*l.* and double the value is inflicted on persons importing for sale books first written and printed in this kingdom, and re-printed abroad; but books not printed or re-printed in this kingdom within twenty years are excepted.

This shall not extend to books printed in England, and inserted in other larger tracts printed abroad. *Ibid.*

This act, by the last continuation of 22 Geo. 3. c. 13. was to continue in force till the year 1788, and is now expired, other provisions having been made by subsequent statutes.

By 15 Geo. 3. c. 53. the two universities in England, and four in Scotland, and the colleges of Eton, Westminster, and Winchester, shall have the sole right, for ever, of printing books which have or (not having been published or assigned) shall be bequeathed, or otherwise given by authors to any of the said universities, unless given for a term of years, or other limited time; and others printing such books forfeit the same, with one penny per sheet, half to the king, and the other to the prosecutor: but this act shall not give an exclusive right, longer than such book is printed at the universities or college press; and they are not to grant away their right, but may sell the copy, as authors can by 8 Ann. c. 19.

None are subject to penalty for printing books already given to the universities, unless entered at Stationers' Hall before 24th June, 1775, and if hereafter given they are to be entered in two months after bequest known, and sixpence paid for each entry, which is to be inspected *gratis*, and sixpence for the certificate. The whole title to be entered. *Ibid.*

By 41 Geo. 3. (U.K.) c. 107. authors of books and their assigns shall have the sole right of printing them for 14 years, and booksellers in any part of the united kingdom, or British European dominions, who shall print, re-print, or import any such books, without the consent of the proprietor, shall be liable to an action for damages, and shall also forfeit the books to the proprietor, and 3*d.* per sheet, half to the king, and half to the informer; and authors shall have a second 14 years' term, if living at the end of the first. Sect 1.

Trinity College, Dublin, shall for ever

have the sole right of printing books given or bequeathed to them, unless they are given for a limited time only ; and persons printing such books are liable to the same penalty as in the last clause ; but this is to extend only to books printed at the college press ; and the college may sell their copy-rights. Sect. 3.

Booksellers shall not be liable to the penalty of 3*d.* per sheet, unless the title to the copy-right be entered by the proprietor at Stationers' Hall, London, nor if the consent of the proprietor be so entered, of which entries the clerk of the company is to give certificates, and make a half-yearly list of the books so entered for the use of Trinity College. Sect. 4.

If the clerk refuses to make entries, parties may give notice in the London Gazette, and the clerk shall forfeit 20*l.* Sect. 5.

Two additional copies of books entered at Stationers' Hall shall be delivered there for the use of the libraries of Trinity College, and the King's Inns, Dublin. Sect. 6.

No person shall import into any part of the United Kingdom, for sale, any book first composed and printed within the United Kingdom, and re-printed elsewhere ; and persons importing, selling, or keeping for sale, any such books, are to forfeit the same, and also 10*l.* and double the value, which books may be seized by officers of customs or excise, and made waste paper of, and the commissioners may reward them with not exceeding their value ; but this clause is not to extend to books not printed in the United Kingdom for 20 years, or books re-printed abroad, and inserted in larger works. Sect. 7.

The 54 Geo. 3. c. 156. recites the statute of the 41 Ann. c. 19., as also that of 41 Geo. 3. c. 107. ; and enacts, that so much of the said several recited acts as requires that any copies of any books which shall be printed or published, or reprinted and published with additions, shall be delivered by the printers thereof to the warehouse-keeper of the said company of stationers, for the use of any of the libraries in the said act mentioned, and as requires the delivery of the said copies by the said warehouse-keeper for the use of the said libraries, and as imposes any penalty on such printer or warehouse-keeper for not delivering the said copies, shall be repealed.

And that eleven printed copies of the whole of every book and of every volume thereof, upon the paper upon which the largest number or impression of such book shall be printed for sale, together with all maps and prints belonging thereto, which, from and after the passing of this act, shall be printed and published, on demand thereof being made in writing to or left at the place of abode of the publisher or publishers thereof, at any time within twelve months next after the publication thereof, under the hand of the warehouse-keeper of the

company of stationers, or the librarian or other person thereto authorised by the persons or body politic and corporate, proprietors or managers of the libraries following ; *videlicet*, the British Museum, Sion College, the Bodleian Library at Oxford, the Public Library at Cambridge, the Library of the Faculty of Advocates at Edinburgh, the Libraries of the Four Universities of Scotland, Trinity College Library, and the King's Inns Library at Dublin, or so many of such eleven copies as shall be respectively demanded, shall be delivered by the publishers thereof respectively, within one month after demand made thereof in writing as aforesaid, to the warehouse-keeper of the said company of stationers ; which copies the said warehouse-keeper shall receive, for the use of the library for which such demand shall be so made ; and he is hereby required, within one month after any such book or volume shall be so delivered to him, to deliver the same for the use of such library : And if any such publisher, or warehouse-keeper, shall not observe the directions of this act, he and they so making default shall forfeit, besides the value of the said printed copies, the sum of five pounds for each copy not so delivered or received, together with the full costs of suit ; to be recovered by action in any court of record in the United Kingdom.

Provided always, that no such copy shall be so demanded or delivered, &c. of the second, or of any subsequent edition of any such book, unless the same shall contain additions or alterations : And in case any edition after the first shall contain any addition or alteration, no printed copy thereof shall be demanded or delivered, if a printed copy of such additions or alterations only, printed in an uniform manner with the former edition of such book, be delivered to each of the libraries aforesaid : Provided also, that the copy of every book that shall be demanded by the British Museum, shall be delivered of the best paper on which such work shall be printed. Sect. 2. & 3.

And whereas by the said recited acts it is enacted, that the author of any book, and the assigns of such author, should have the sole liberty of printing and re-printing such book for the term of fourteen years, &c. ; and it was provided, that after the expiration of the said term of fourteen years, the right of printing or disposing of copies should return to the authors thereof, if they were then living, for another term of fourteen years : And whereas it will afford further encouragement to literature, if the duration of such copyright were extended, the author of any book or books composed and not printed and published, or which shall hereafter be composed, and be printed and published, and his assigns, shall have the sole liberty of printing and reprinting such book or books, for the full term of twenty-

eight years, to commence from the day of first publishing the same, and also, if the author shall be living at the end of that period, for the residue of his natural life; and if any bookseller or printer, or other person whatsoever, in any part of the United Kingdom of Great Britain and Ireland, in the Isles of Man, Jersey, or Guernsey, or in any other part of the British dominions, shall, from and after the passing of this act, within the times granted and limited by this act, print, reprint, or import, or shall cause to be printed, &c. any such book, without the consent of the author, or other proprietor of the copyright; or, knowing the same to be so printed, &c. without such consent shall sell, publish, or expose to sale, or cause to be sold, &c., or shall have in his possession for sale, any such book, without such consent first had and obtained, such offender shall be liable to a special action, at the suit of the author, or other proprietor of such copyright: And every such author, or other proprietor, may, in such special action, recover damages, with double costs; and every such offender shall also forfeit such book, and every sheet of such book, and shall deliver the same to the author, or other proprietor; and shall also forfeit the sum of three-pence for every sheet thereof, either printed or printing, or published or exposed to sale; the one moiety thereof to the king, and the other moiety thereof to any person who shall sue for the same. Sect. 4.

And in order to ascertain what books shall be from time to time published, the publishers of every book demandable under this act, shall, within one calendar month after the day on which any such book shall be first sold, published, advertised, or offered for sale, within the bills of mortality, or within three calendar months in any other part of the United Kingdom, enter the title to the copy of every such book, and the names, and place of abode of the publisher, in the register book of the company of stationers in London (for every of which several entries the sum of two shillings shall be paid, and no more), under a penalty of the sum of five pounds, together with eleven times the price at which such book shall be sold or advertised, to be recovered, together with full cost of suit, by persons authorised to sue, and who shall first sue for the same. Provided that in the case of magazines, reviews, or other periodical publications, it shall be sufficient to make such entry in the register book of the said company, within one month next after the publication of the first number or volume. Provided that no failure in making any such entry shall in any manner affect any copyright, but shall only subject the person making default to the penalty aforesaid under this act. Sect. 5.

Provided always, that if any publisher shall be desirous of delivering the copy of such book or volume, on behalf of any of the said libraries, at such library, it shall and may be lawful for him to deliver the same at such library; and such delivery shall be held as equivalent to a delivery to the said warehouse-keeper.

And if the author of any book, which shall not have been published fourteen years at the time of passing this act, shall be living at the said time, and if such author shall afterwards die before the expiration of the said fourteen years, then the personal representative of the said author, and the assigns of such personal representative, shall have the sole right of printing and publishing the said book for the further term of fourteen years after the expiration of the first fourteen.

And if the author of any book which has been already published shall be living at the end of twenty-eight years after the first publication, he or she shall for the remainder of his or her life have the sole right of printing and publishing the same.

But all actions and suits shall be commenced within twelve months next after such offence committed, or be void and of no effect. Sect. 7, 8, 9, 10.

Respecting the composition and manufacture of books, *see titles* BOOK-BINDING and PRINTING.

BOOK-BINDING, the art of gathering and sewing together the sheets of a book, and covering it with a back, &c. which is performed thus: The leaves are first folded with a folding-stick, and laid over each other in the order of the signatures, which are the letters with the numbers annexed to them at the bottom of the pages of the first one, two, or more leaves in each sheet. The leaves thus folded are then beaten on a stone with a hammer, to make them smooth and open well, and afterwards pressed. Whilst in the binder's press they are sewed upon bands, which are pieces of cord or pack-thread; six bands to a folio book, five to a quarto, octavo, &c. which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first and proceeding to the last. After this the books are glued, and the bands opened and scraped, for the better fixing the paste-boards; the back is turned with a hammer, and the book fixed in a press between two boards; in order to make a groove for fixing the paste-boards; these being applied, holes are made for fixing them to the book, which is pressed a third time. Then the book is at last put to the cutting-press, betwixt two boards, the one lying even with the press for the knife to run upon, the other above it for the knife to run against: after which the paste-boards are squared. The next operation is the sprinkling the leaves of the book,

which is usually done by dipping a brush into vermilion and sap-green, holding the brush in one hand, and spreading the hair with the other; by which motion the edges of the leaves are sprinkled in a regular manner, without any spots being larger than the other.

The covers, (which are either calf or sheepskin,) being moistened in water, are next cut out to the size of the book, then smeared over with paste made of wheat flour, and afterwards stretched over the pasteboard on the outside, and doubled over the edges withinside, after having first taken off the four angles, and indented and platted the cover at the head-band; which done, the book is covered and bound firmly between two bands, and then set to dry. Afterwards it is washed over with a little paste and water, and then sprinkled fine with a brush, unless it should be marbled, when the spots are to be made larger by mixing the ink with vitriol. After this the book is glazed twice with the white of an egg beaten, and at last polished with a polishing iron passed hot over the glazed cover.

The letters or ornaments on books are made with gilding tools engraved in relievo, either on the points of puncheons, or around little cylinders of brass. The puncheons make their impressions by being pressed flat down, and the cylinders being rolled along by a handle, to which they are fitted on an iron axis. To apply the gold, the binders glaze the parts of the leather with a liquor made of whites of eggs diluted with water, by means of a piece of sponge; and when nearly dry, the pieces of gold leaf are laid on, and the tools being made hot in a charcoal fire, are applied.

BOOK-KEEPING is the art of teaching how to dispose the accounts of business, so that the true state of every part and of the whole may be easily and distinctly known. Merchants' books are kept either by single, or by double entry; the former method by retailers of merchandise, and the latter by merchants, wholesale dealers, &c.

The most considerable books, according to the Italian method of double entry, are the waste-book, the journal, and the ledger; but besides these three, which are absolutely necessary, there are several others, called auxiliary books, which are used in proportion to the business a man transacts. These books are the cash-book, the bill-book, the invoice-book, the account current-book, the commission, or order, or advice-book, the letter-book, &c. of all which we shall treat more fully hereafter.

The *Waste-Book* may be defined a register, containing an inventory of a merchant's effects and debts, with a distinct record of all his transactions and dealings, in the way of trade, related in a plain, simple style,

and in order of time as they succeed one another. The waste-book opens with the inventory, which consists of two parts; first, the effects, that is, the cash or bills of exchange a merchant has by him, the goods he has by him, his part of ships, houses, farms, &c. with the debts due to him; the second part of the inventory consists of the debts due by him to others: the difference between which and the effects is what the merchants call neat stock.

When a man commences trade, the inventory is to be gathered from a survey of the particulars that make up his real estate, but ever after it is to be collected from the balance of his old books, and carried to the new.

After the inventory is fairly related in the waste-book, the transactions in trade come next to be entered down, which is a daily task, to be performed as they occur. The narrative ought to exhibit transactions with all the circumstances necessary to be known, and no more. It should contain the names of persons with whom the merchant deals upon trust, the conditions of bargains, the terms of payment, the quantity, quality, and prices of goods, with every thing that serves to make the record distinct, and nothing else. The waste-book, if no subsidiary books are kept, should contain a record of all the merchant's transactions and dealings in the way of trade; and that not only of such as are properly and purely mercantile, but of every occurrence that affects his stock, so as to impair or encrease it, such as private expences, servants' wages, house-rent, taxes, money gained, &c.

The *Journal* is the book in which the transactions recorded in the waste-book are prepared to be carried to the ledger, by having their proper debtors and creditors ascertained and pointed out: whence it may be observed, that the great design of the journal is to prevent errors in the ledger: again, after the ledger is filled up, the journal facilitates the work required in revising and correcting it; for, first the waste-book and journal are compared, and then the journal and ledger; whereas to revise the ledger immediately from the waste-book, would be a matter of no less difficulty than to form it without the help of a journal: lastly, the journal is designed as a fair record of a merchant's business, for neither of the other two books can serve this purpose. Hence it is, that in case of differences between merchants and their dealers, the journal is the book commonly called for and inspected by courts of justice.

In the journal, persons and things are charged debtors to other persons and things as creditors; and in this it agrees with the ledger, where the same style is used, but differs from it as to forms and order; so that it agrees with the waste-book in those

very things where it differs from the ledger ; and, on the other hand, it agrees with the latter, in the very point where it differs from the former ; but in order to state the comparison betwixt the waste-book and the journal, we shall turn two or three examples of the waste-book into a journal form.

Waste Book.

1st January 1818.			
	£.	s.	d.
Bought of Gale, Browne, and Co. 10 butts Sherry, at 95 <i>l.</i> per butt, payable in 3 months,	950	0	0
2d.			
Bought of Quintin Dick, and Co. 100 pieces of Irish linen, seven- eighths wide, quantity 2500 yards, at 16 <i>d.</i> per yard; per bill at 4 months	333	6	8
5th.			
Sold Luke Duff, 105 tierces Irish mess beef, branded <i>Howard and Son</i> , at 5 <i>l.</i> per tierce, payable at 6 months	525	0	0

Journal.

1st January 1818.			
Sherry Wine Dr. to Gale, Browne, and Co. 950 <i>l.</i> for 10 butts, at 95 <i>l.</i> per butt, payable in 3 months	950	0	0
2d.			
Linen Cloth Dr. to Quintin Dick, and Co. 333 <i>l.</i> 6 <i>s.</i> 8 <i>d.</i> for 100 pieces, quantity 2500 yards, at 16 <i>d.</i> per yard, payable in 4 months	333	6	8
5th.			
Luke Duff Dr. to Sales Provi- sions, account of Howard and Son, 525 <i>l.</i> for 105 tierces beef, at 5 <i>l.</i> per tierce, per bill at 6 months	525	0	0

The Ledger. — The ledger is the principal book wherein all the several articles of each particular account that lie scattered in other books, according to their dates, are collected and placed together in spaces allotted for them, in such a manner, that the opposite parts of every account are directly set fronting one another, or opposite sides of the same folio.

The ledger's folios are divided into spaces for containing the accounts, on the head of which are written the titles of the accounts, marked Dr. on the left hand page, and Cr. on the right ; below which stand the articles, with the word *To* prefixed on the Dr. side, and the word *By* on the Cr. side ; and upon the margin are recorded the dates of the articles, in two small columns allotted for that purpose. The money columns are the same as in other books :

before them stands the folio column, which contains figures directing to the folio where the corresponding ledger entrance of each article is made, for every thing is twice entered in the ledger, viz. on the Dr. side of one account, and again on the Cr. side of some other account ; so that the figures mutually refer from one to the other, and are of use in examining the ledger. Besides these columns, there must be kept in all accounts, where number, measure, weight, or distinction of coins is considered, inner columns to insert the quantity ; and for the ready finding any account in the ledger, it has an alphabet or index, wherein are written the titles of all accounts, with the number of the folio where they stand. How the ledger is to be posted from the journal.

1. Turn to the alphabet, and see whether the Dr. of the journal post, to be transported, is written there ; if not, insert it under its proper letter, with the number of the folio to which it is to be carried.

2. Having distinguished the Dr. and the Cr. sides, as already directed, recording the dates, complete the entry in one line, by giving a short hint of the nature and terms of the transaction, carrying the sum to the money columns ; and inserting the quantity, if it is an account of goods, &c. in the inner columns, and the referring figure in the folio column.

3. Next turn to the creditor of the journal post, and proceed in the same manner with it, both in the index and ledger ; with this difference only, that the entry is to be made on the Cr. side, and the word *By* prefixed to it.

4. The post being thus entered in the ledger, return to the journal, and on the margin mark the folios of the accounts, with the folio of the Dr. above, and the folio of the Cr. below, and a small line between them thus $\frac{1}{2}$. These marginal numbers of the journal, are a kind of index to the ledger, and are of use in examining the books, and on many other occasions.

5. In opening accounts in the ledger, follow the order of the journal as to Dr. and Cr. ; and leave a sufficient space in the ledger for the different persons' accounts, according to the extent of them, so as to prevent the necessity of transferring the accounts to different folios in the ledger. Begin with the first journal-post, allow the first space in the ledger for the Dr. of it, the next for the Cr. the third for the Dr. of the following post, if it is not the same with some of those already opened, and so on till the whole journal be transported : and supposing that, through inadvertency, some former space has been allowed too large, you are not to go back to subdivide it, in order to open another account in room thereof. Though these rules are formed

for simple posts, where there is but one Dr. and one Cr. yet they may be easily applied to complex posts.

By way of example how the journal is to be posted into the ledger, we shall give the following specimen:

LEDGER.

1818 Dr. Sherry-wine. Fo. £. s. d.				Contra, Cr. Fo. £. s. d.

Dr. Sales of Provisions, account of Howard & Son.				Contra, Cr.			
				1818 Jan. 5	By Luke Duff, as per journal	8 525 0 0	

Cash Book, is so called because it contains, in debtor and creditor, all the cash that comes in, and goes out of a merchant's stock, the receipts on the debtor side, the persons of whom it was received, on what, and on whose account, and in what specie, and the payment on the creditor side, mentioning also the specie, the reasons of the payments, to whom, and for what account they are made.

Invoice Book.—This book is kept to copy the invoices in, and to preserve the journal from erasures, which are unavoidable in drawing out the invoices of several sorts of merchandise received, sent out, or sold, wherein very minute particulars must be entered. It is also useful in finding out at once the particulars of each invoice without reference to the waste book, &c.

Account-Current Book.—This book contains copies of the accounts which are sent to correspondents, in order to settle them in concert, before they are balanced in the ledger.

Warehouse-Book.—This book contains a list of all the merchandise that are lodged in the warehouse, those that are taken out of it, and those that remain, by which means the warehouse stock at the end of the year is the more readily ascertained.

Book of Payments or Debts.—In this book is written down the day on which all sums become due, either to be paid or received, by bills of exchange, notes of hand (*promissory notes*), merchandise bought or sold, or otherwise. By comparing receipts and payments, one may, in time, provide the necessary funds for payments, by getting the bills, notes, &c. due to be paid, or by taking other precautions.

Bill Book.—In this book are entered the bills of exchange, which merchants accept, also notes of hand, specifying the drawer, to whom payable, the date, the day when due, the sum, &c.; this book is called *Bills payable*. The reverse side of the bill-book is called *Bills receivable*, in which are entered in like manner the bills and notes with all the particulars of them, which are received in the course of business, how disposed of, &c. By reference to this book a merchant sees at once the state of all outstanding bills for and against him.

Letter Book.—Is a book which all letters are carefully copied into, with an alphabet or index annexed to it, referring to the names of correspondents, by the folio. There are several other books; as the petty cash book, postage book, &c. whose titles sufficiently indicate their various uses.

BOOM, in the sea language, a long piece of timber, with which the clew of the scudding-sail is spread out; and sometimes the boom is used to spread or boom out the clew of the main mast.

Boom denotes also a cable stretched athwart the mouth of a river or harbour;

with yards, top-masts, battling, or spars of wood, lashed to it, to prevent an enemy's coming in.

BOOMKIN, in the sea language, a short bar of timber projecting from each bow of a ship, to extend one edge of the fore-sail to the windward; for which purpose there is a large block fixed to its outer end, through which the rope is passed that is fastened to the lower corner of the sail to windward, called the tack; and this being drawn tight down, brings the corner of the sail close to the block, which being performed, the tack is said to be aboard. The boomkin is secured by a strong rope, which confines it downward to the ship's bow, to counteract the train it bears from the foresail above, dragging it upwards.

BOOTS, (GER. *Stiefel*. DU. *Laarszen*. DA. *Stivle*. SW. *Stijlar*. FR. *Bottes*. IT. *Stivali*. SP. and PORT. *Botas*. RUS. *Sapogi*. POL. *Boty*, *Szibly*.) are manufactured for exportation in Stafford, Northampton, Shrewsbury, and many other towns in Great Britain, but the best sort are made in London. They are among the prohibited articles of importation in the Russian tariff.

BORAX, (GER. DA. SW. FR. and LAT. *Borax*. DU. *Boras*. IT. *Borrace*, *Boraso*. SP. and PORT. *Borraz*. RUS. *Bura*, *Borakss*. POL. *Boraks*.) is used as a flux for metals, and enters into the composition of some of the coloured glass pastes made in imitation of gems; but its greatest use is to facilitate the soldering of the more precious metals. It is employed also as a flux by mineralogists in assaying the properties of minerals by the blow pipe. It is brought to us from the East Indies, in great masses, composed partly of large crystals, but chiefly of smaller ones, partly white, and partly green, joined together by a greasy yellow substance intermingled with sand, small stones, and other impurities. The purer crystals exposed to the fire, melt into a glassy kind of substance, (of somewhat more than half their former weight) which is nevertheless soluble in water. The rough or native *borax*, called by the Arabians *tincar* or *tincal*, which signifies a kind of nitre used for soldering gold, should be chosen in firm and solid pieces of a greenish colour, fatty to the touch, and of the most rank smell.

BORDAT, or **BORDETTI**, a very narrow kind of stuff, manufactured in several parts of Turkey.

BOROUGH. Whatever may have been the original signification of this word, it is now usually applied to such towns or places as send representatives to the British parliament. They are distinguished into those by charter, by statute, and by prescription; technical differences, into which it is not necessary to enter here. In Scotland the term has a more extensive signification, when the epithet *Royal* is prefixed to it; for it then means one of those incorporated

places which have received the privilege of sending commissioners to a general convention in Edinburgh, to consult upon the general interests of trade, as well as those of their own particular places. This privilege they derive from a grant of their king James 3d. who invested this convention with great powers.

BOSPHORUS, in geography, a narrow streight or arm of the sea. The word is principally applied to two places, viz. the *Bosphorus* of Thrace, now usually called the streights of Constantinople; and the Cimmerian or Scythian *Bosphorus*, now called the streights of Kapha or Kiderleri.

BOSS, among bricklayers, denotes a wooden utensil in which the mortar used in tiling is to be put. It has an iron hook by which it may be hung on the laths, or on the ladder.

BOTARGO, a kind of sausage, made with the roes and blood of the sea-mullet, a large fish pretty common in the Mediterranean. The best *botargo* comes from Tunis in Barbary. It is also made in the neighbourhood of Marseilles. *Botargo*, or caviar, may be imported. 10 & 11 W. 3. c. 24.

BOTTLES, (GER. *Bouteillen*. DU. *Botels*. DA. and SW. *Bouteiller*. FR. *Bouteilles*. IT. *Bottiglie*, *Fiaschi*. SP. *Botellas*, *Limetas*. PORT. *Botelhas*. RUS. *Butilki*. POL. *Butly*, *Butelki*.) Bottles manufactured in England are superior to that of any other nation, and furnish a great article of exportation. See GLASS.

BOTTOM, in navigation, is used to denote as well the channel of rivers and harbours, as the body or hull of a ship: thus in the former sense, we say a gravelly bottom, clayey bottom, sandy bottom, &c. and in the latter sense, alluding to the State in whose service the vessel is, a British bottom, a Danish bottom, a Dutch bottom, &c. By statute, certain commodities imported in foreign bottoms, pay a duty called petty customs, over and above what they are liable to, if imported in British bottoms.

BOTTOMRY, a marine contract for the borrowing of money upon the keel or bottom of a ship; that is, when the master of a ship binds the ship itself, that if the money be not paid by the time appointed, the creditor shall have the ship.

BOTTOMRY, is also where a person lends money to a merchant, who wants it in traffic, and the lender is to be paid a greater sum at the return of the ship, standing to the hazard of the voyage; on which account, though the interest be greater than what the law commonly allows, yet it is not usury, because the money being furnished at the lender's hazard, if the ship perishes, he shares in the loss. When the ship and tackle are brought home, they are liable as well as the person of the borrower for the money lent: but when the loan is not made upon the vessel, but upon the goods and merchan-

dizes laden therein, which, from their nature, must be sold or exchanged in the course of the voyage; then the borrower only is personally bound to answer the contract; who therefore, in this case, is said to take up money at *respondentia*. 2 Black. 458.

In this consists the difference between *bottomree*, and *respondentia*, that the one is a loan upon the ship, the other upon the goods: in the former, the ship and tackle are liable, as well as the person of the borrower; in the latter, for the most part, recourse must be had to the person only of the borrower. *Ibid*.

Another observation is, that in a loan upon *bottomree*, the lender runs no risk though the goods should be lost: and upon *respondentia* the lender must be paid his principal and interest, though the ship perish, provided the goods are safe; but in all other respects the contract of *bottomry* and that of *respondentia* are upon the same footing. 2 Black. 458.

It is enacted by 19 Geo. 2. c. 57. that after the 1st August, 1746, every sum of money lent in bottomry, upon the ships of any subjects to or from the East Indies, shall be lent only on the ship, or the merchandise laden on board her, and so expressed in the condition of the bond; and the benefit of salvage shall be granted to the lender, his agents, &c. who only shall have a right to make assurance on the money lent; and no borrower of money on bottomry shall recover more on any assurance, than the value of his interest on the ship or effects, exclusive of the money borrowed. And if the value of his interest does not amount to the money borrowed, he shall be responsible to the lender for the surplus, with lawful interest for the same, together with the assurance, and all charges whatsoever, &c. notwithstanding the ship and merchandise shall be totally lost.

BOULINIS, or **BOULIGNIS**, a copper coin, struck at Bologna, in Italy, value about one penny, British.

BOUND-BAILIFFS, vulgarly termed Bum-bailiffs, so called because they give bond to the sheriffs for the due execution of their duties.

BOUNTY, a premium paid by the government to the exporters of certain British commodities, on their taking oath, or, in some cases, giving bond, not to reland the same in England. Bounties, as they respect the fisheries, are either perpetual or temporary. The former are payable on the export of pilchards, cod-fish, ling, whether wet or dried, salmon, white herrings, red herrings, and dried sprats, being of British fishery and curing. The latter are payable on the tonnage of ships, carrying on the British and Greenland fisheries, on the quantity of fish taken in the British and Newfoundland fisheries, on the quantities

of oil, blubber, and whale-fins, taken in the southern whale-fishery.

Bounties have been granted by several statutes, on the exportation of corn, when it does not exceed stipulated prices at the port of exportation. Those trades only require bounties, in which the profits are insufficient, and the bounty is given to encourage persons to continue, or perhaps to commence a trade that may be important to the interests of the country. See DUTIES and DRAWBACKS.

BOW of a ship, that part which begins at the loof, and compassing the ends of the stem, finishes at the sternmost of the fore-castle. That part upon the right-hand side of the stem, to a person on deck and looking forward, is called the starboard bow, and on the left-hand side is called the larboard bow.

BOW, *Weather*, is that part of the bow towards the wind, when a ship is close-hauled; and the other part is called the lee-bow.

BOW, *on the*, an expression to denote the position of any object, as a ship, the land, &c. appearing in the direction of some particular part of the bow. If a ship is sailing directly towards the object, it is said to be right a-head; if not, the object is said to be on the starboard or larboard, or on the weather or lee bow.

BOWER, the name of an anchor carried at the bow of a ship. There are generally two bowers, called first and second, great and little, or best and small bower.

BOW-LINE, a rope fastened near the middle of the leech or perpendicular edge of the principal square sails, by three or four subordinate parts called bridles, and leading forward towards the bow, whence it derives its name. It is always used when the wind is so unfavourable, that the sails must be all traced sideways, or close-hauled to the wind; in this situation, the bow-lines are employed to keep the weather or windward edges of the principal sails right forward and steady, without which they would be perpetually shivering, and rendered incapable of service. The bow-line is fastened by two, three, or four ropes, like a crow's foot, to as many parts of the sail; only the mizen bow-line is fastened to the lower end of the yard. This rope belongs to all sails, except the sprit-sail and sprit-topsail. The use of the bowline is to make the sails stand sharp or close, or by a wind.

"*Sharp the bow-line*," is hale it tawt, or pull it hard. "*Hale up the bow-line*," that is, pull it harder forward on. "*Check or ease, or run up the bow-line*," that is, let it be more slack.

BOWSE, in the sea language, signifies as much as to hale or pull. Thus, bowsing upon a tack, is haling upon a tack. "Bowse away," that is, pull away all together.

BOWSPRIT, or BOLTSPRIT, (GER. *Bug-*

sprit. DU. *Boegsprit*. DA. *Bogsprid*. SW. *Bogsprüt*. FR. *Beaupré*. IT. *Buonpresso*, *Copresso*. SP. *Baupres*. PORT. *Gurupes*. RUS. *Buckschprit*.) a kind of mast, resting slopewise on the head of the main stem, and having its lower end fastened to the partners of the foremast, and farther supported by the fore-stay. It carries the sprit-sail, sprit-top-sail, and jack-staff; and its length is usually the same with that of the fore-mast.

BOWYERS, artificers whose employment or occupation it is to make bows. There is a company of bowyers in the city of London, first incorporated in 1623.

BOX, is a word of most extensive and diversified signification. It is used to denote a case for holding articles great, or small, from the size of a clothes-box, to that of a snuff-box. A considerable trade used to be carried on in the exportation of small ornamental boxes for various purposes, especially snuff-boxes of jewellery, gold, and inferior composition, from this country, though the French always surpassed us in the elegance of their manufacture of them. They are now among the prohibited articles of the last Russian tariff, both generally and specifically, for it prohibits boxes generally, and also enumerates snuff-boxes, sand-boxes, and spitting-boxes.

BOX-WOOD, (GER. *Buchsbaum*. DU. *Palmhout*. DA. & SW. *Buxbom*. FR. *Buis*. IT. *Busso*, *Bosso*, *Bossolo*. SP. *Bor*. PORT. *Bucho*, *Buro*. RUS. *Jamschit*, *Seleniza*. POL. *Bukszan*. LAT. *Buxus*.) is yellowish, hard, solid, even, very heavy, and takes a good polish. It is used in works of sculpture, and in instruments of music, such as violins, hautboys, flutes, flageolets, &c. also in combs, boxes, pullies, &c.

BRACELET, an ornament put round the wrist. There are some made of gold, of woven hair, of pearls, of precious stones, &c.

Bracelets are in use as well among the polite, as the most barbarous nations. The inhabitants of Madagascar make them of metal, in the form of a ring or chain. The savages of America have them of glass beads. The blacks on the coast of Guinea make them of those shells which are called cowries, or couris, in Asia, and bouges in Africa; and it is in order to get these ornaments, that they all give their richest merchandize, and even barter for those trifles the liberties of their fathers, wives, and children. The importation of them is prohibited by the last Russian tariff.

BRACES, are ropes belonging to all the yards of a ship, except the mizen, two to each yard, reeved through blocks that are fastened to pennants, seized to the yard-arms. Their use is either to square or transverse the yards.

BRACE, in writing, a term used to signify a crooked line, thus } , made at the end

of two or more articles in an account; the amount of which is usually placed in the centre of the brace. It is used also in printing, to inclose an entire passage, as a triplet in poetry.

BRACKETS, in a ship, the small knees serving to support the galleries, and commonly carved. Also, the timbers that support the gratings in the head are called brackets.

BRADS, a kind of nails used in building, which have no spreading heads, as other nails have. Ironmongers distinguish them by six names; as joiners' brads, flooring-brads, batten-brads, bill-brads, or quarter-heads, &c. Joiners'-brads are for hard wainscot, batten-brads for soft wainscot, bill-brads are used when a floor is laid in haste, or for shallow joists subject to warp. See NAIL.

BRAIL or **BRAILS**, in a ship, are small ropes made use of to furl the sails across; they belong only to the two courses, and the mizen-sail.

BRAN, the thin skins or husks of corn, especially of wheat, ground, and separated from the corn by a sieve or boulder. It is of wheat bran that starch-makers make their starch. The dyers reckon bran among the non-colouring drugs, and use it for making what they call the sour waters, with which they prepare the dyes.

BRANDY, (GER. *Brantwein*. DU. *Brandewyn*. DA. *Baendevin*. SW. *Brännvin*. FR. *Eau de vie*, *Brandevin*. IT. *Acquariente*. SP. *Aguardiente*. PORT. *Aguardente*. RUS. *Wino*. POL. *Gorzalka*, *Wodka*. LAT. *Vinum adustum*.) a spirituous and inflammable liquor, extracted from wine and other liquors, and likewise from the husks of grapes by distillation. Brandy is prepared in many of the wine countries of Europe, and with particular excellence in Languedoc, in Anjou, and other parts of the south of France, whence is the Coniac brandy.

In distilling brandy, the strong heavy wines are preferred. It is expected that all wines used for this purpose, should yield at least one-sixth of their quantity of spirit.

Brandy is naturally clear and colourless as water. The different shades of colour which it has in commerce arise partly from the casks in which it is kept, but chiefly from the addition of burnt sugar, saunders-wood, and other colouring matters that are intentionally added by the manufacturer, and which are neither of advantage nor disadvantage to the quality of the spirit; although it is generally admitted that the burnt sugar gives a mellowness to the flavour of the liquor, and renders it more palatable.

Besides the brandy made of wine, there is some made of beer, cyder, syrups, sugar, molasses, fruit, grain, &c.: however, these are not properly called brandy, but go under the general denomination of spirits.

Brandy is used in medicine, and in dyeing when rectified into spirit of wine, being then reckoned by the dyers among the non-colouring drugs.

The pipe contains about eighty French veltes, (about one hundred and twenty English gallons.)

This being an article of foreign manufacture, and liable to a heavy duty on importation, it has of course been the subject of every statute for regulating the duties of customs on the importation of foreign spirits, which duties of course depend on the commercial treaties with other countries respectively. Brandy distilled from grain of every kind is one of the articles prohibited by the Russian tariff.

BRASIL-WOOD, or **BRAZIL-WOOD**. (GER. *Brasilienholz*. DU. *Brasiliehout*. DA. *Brasilientræe*. SW. *Brasilia*. FR. *Bois de Bresil*. IT. *Legno del Brasile*, *Verzino*. SP. *Brasil*, *Madera del Brasil*. PORT. *Pao Brasil*. RUS. *Brasilscoe derewo*. POL. *Brezylia*. LAT. *Lignum Brasilianum*.) Thus called, because it comes at first from *Brazil*, a province in South America. It is of a red colour, and very heavy. It is denominated variously, according to the places whence it is brought: thus we have Brasil from Fernambuca, Japan, Lamon, Santa Martha, and lastly Brasilleto, which is esteemed the worst. This last comes from the Antilles islands.

This wood must be chosen in thick pieces, close, sound, without any bark on it, and such as, upon splitting, if pale becomes reddish, and, when chewed, has a saccharine taste. It is much used in turned work, and takes a good polish; but is chiefly used in dyeing.

When the sulphuric acid is added slowly to a fresh watery decoction of Brasil-wood, a small quantity of red precipitate falls down, and the liquor becomes yellow. Nitric acid produces a similar change; but the liquor is orange. Most of the other acids produce red precipitates. The alkalies restore in part the colour of the liquor. The action of the solutions of tin and of alum is the most important. Alum gives a fine red precipitate in great abundance; and in this manner a fine crimson lake and carmine are sometimes prepared, which consist of alumina, united with the natural colour of the wood. Nitro-muriat of tin, added to the decoction, separates the whole of the colouring matter, which falls down in great abundance, united with the oxide of tin, and the liquor remains colourless. The solutions of iron blocken Brasil-wood manifest the presence of gallic acid.

The colour of Brazil-wood, though very beautiful, is fugitive, and is readily darkened and rendered purple by alkalies, or by soap that contains an alkali. When it is used by dyers, they employ acids and tin to fix the colour.

BRASILETTO, (GER. *Brasiletholz*. DU. *Brasilehout*. DA. *Brasileholt*. SW. *Brasiletta*. FR. *Bresillot*. IT. SP. and PORT. *Brasileto*.) the worst species of Brasil-wood. See **BRASIL-WOOD**.

BRASS, (GER. *Messing*. DU. *Messing*, *Missing*, *Geelkoper*. DA. and SW. *Messing*. FR. *Cuivre jaune*, *Laiton*. IT. *Ottone*. SP. *Latón*, *Azofar*. PORT. *Latao*. RUS. *Selenoi mjed*. POL. *Mosiadz*. LAT. *Orichalcum*, *Aurichalcum*.) is a factitious metal, made of copper and zinc in proper proportions. It is of a beautiful yellow colour, more fusible than copper, and not so apt to tarnish. It is malleable, and so ductile that it may be drawn out into wire. Its density is greater than the mean density of the two metals. By calculation it ought to be 7.63 nearly, whereas it is actually 8.39; so that its density is increased by about 1-10th. The ancients do not seem to have known accurately the difference between copper, brass, and bronze. They considered brass as only a more valuable kind of copper, and therefore used the word *æs* to denote either. They called copper *æs cyprium*, afterwards *cyprium*; and this in process of time was converted into *cuprum*. The method of preparing brass is as follows: The zinc having been calcined and ground fine as flour, is mixed with fine charcoal, and incorporated, by means of water, into a mass: this being done, about seven pounds of zinc are put into a melting-pot that will contain about a gallon, and over that about five pounds of copper; this pot is let down into a wind-furnace, where it remains for eleven hours, in which time it is converted into brass. The metal then is cast, either in plates or lumps; forty-five pounds of crude zinc will produce thirty pounds, when calcined or burnt. Sometimes brass-shurf is used instead of copper; but that is not always to be procured in quantities sufficient, it being no other than a collection of old brass.

Pure brass is not malleable, unless when it is hot; for when it is cold it will break; and after it has melted twice, it will be no longer in a condition to bear the hammer at all: but in order to render it capable of being wrought, they put seven pounds of lead to a hundred weight of brass, which renders it more soft and pliable.

The most important properties of brass are, that its colour is much brighter and nearer approaching to gold than copper. It is also more fusible, and less subject to rust, and to be acted upon by a vast variety of substances which corrode copper: it is likewise more capable of extension, and particularly adapted for wire.

Mr. Smeaton found that 12 inches in length of cast brass, at 32°, expanded by 180° of heat, $\frac{225}{10000}$ parts: brass wire under the same circumstances, expanded $\frac{232}{10000}$. The expansion of hammered copper is only

$\frac{204}{10000}$, but that of zinc is $\frac{343}{10000}$; so that brass holds a middle place in this respect between its two component metals.

There is a vast variety in the proportions of the different species of brass used in commerce; nor is it easy to determine whether the perfection of this alloy depends on any certain proportions of the two metals. In general, the extremes of the highest and lowest proportions of zinc are from 12 to 25 parts in the 100. The ductility of brass is not injured with the highest proportion. This metal is much used in the escapement wheels, and other nicer parts of watch-making; and bars of brass very carefully made, will fetch for this work a very great price.

The use of brass is of very considerable antiquity. Most of the ancient genuine relics are composed of various mixtures of brass with tin and other metals, and are rather to be denominated bronzes. The best proportion of brass guns is said to be 1000 pounds of copper, 990 pounds of tin, and 600 pounds of brass, in 11 or 12 hundred weight of metal. The best brass guns are made of malleable metal, not of pure copper and zinc alone; but worse metals are used to make it run closer and sounder, as lead and pot-metal. See **CANNON**.

During the reigns of Hen. 7. & 8. and Edw. 6. five different statutes were passed to prevent the exportation of brass and copper in an unmanufactured state. Searchers were directed to be appointed in cities and boroughs, to see that no adulterated or bad brass, &c. was sold. These statutes, however, were loosely worded, and grown obsolete, and the two relative to the exportation, viz. the 33 Hen. 8. c. 7. and 2 & 3 Edw. 6. c. 37. are repealed by 53 Geo. 3. c. 44.

BRASS - FOUNDER. There are various sorts of founders: those who only cast for braziers' shops; others who cast buckles, studs, and bars for the sadlers; those who cast for coach-makers, &c.; but all work on the same principles, but with different moulds. See **FOUNDRY**.

BRAULS, Indian cloths with blue and white stripes: they are also called turbans, because they serve to cover those ornaments of the head, particularly on the coast of Africa.

BRAWN, the flesh of a boar soused or pickled. The animal should be of considerable age, because the older he is, the thicker will be the shield or rind, in which much of the excellence of the commodity consists.

It is the flitches only that are made into brawn; the bones of which are taken out, and the flesh sprinkled with salt, and laid in a tray, that the blood may be drawn off: then it is to be salted a little, with a sufficient addition of salt-petre to give it a pink hue, and rolled up as hard as possible. The length of the collar of brawn should be as

much as one side of the boar will bear ; so that when rolled up, it may be nine or ten inches diameter.

The collar being thus rolled up, is to be boiled in a copper, or large kettle, till it is so tender, that you can run a stiff straw through it : when thoroughly cold, put it into the following pickle : To every gallon of water, a handful or two of salt, and as much wheat bran ; boil them together, then drain the bran as clear as possible from the liquor : and when the liquor is quite cold, put the brawn into it.

BRAZIER, an artificer who makes kettles, pans, candlesticks, and other kitchen utensils in brass. Some of the articles manufactured by the working brazier are beaten out with the hammer, and united in their several parts by solder ; others are cast, but those which are cast belong more properly to the business of the founder, excepting the polishing and finishing, which require the art of the brazier.

BRAZING, the soldering or joining in two pieces of iron together, by means of thin plates of brass, melted between the pieces that are to be joined. If the work is very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brass powder, which is added to it : the piece is then exposed to the fire without touching the coals, and heated till the brass runs.

BREAD, is ordinarily made of the flour or meal of some farinaceous vegetable, ground, and kneaded with water and yeast. In this country, bread is generally divided into white, wheaten, and household, differing from one another primarily in their degrees of purity, but secondarily in the grain from which the flour is obtained. White and wheaten bread are only bread made of wheaten flour in different stages of purification from the bran ; but household bread (as the word is colloquially used) means bread of an inferior quality, whether that inferiority arise from a mixture of rice, bran, or of the flour of any other grain, as rye, or barley. More correctly, bread composed of mixed ingredients should be distinguished by the name of mixed, or maslin, bread, but is more generally called merely "*brown bread*." The statutes for the regulation of bread-making for sale, in order to protect the public from the frauds of millers, mealmen, and bakers, are numerous—too numerous, indeed, to be even individually referred to here ; but the substance of the general regulations is as follows. Some are generally applicable to the whole kingdom, some only to the metropolis ; some to bread where an assize is set, some to bread where there is no assize. (*See Dick. Pract. Expos.* v. 1. p. 184. & v. 3. p. 74.) It is sufficient for the purpose here to observe, that 31 Geo. 2. c. 29. is the great

foundation stone on which all the subsequent system of legislation respecting bread has been erected.

This statute enacts, that an assize of bread may be set where convenient, in proportion to the price of corn, making a reasonable allowance to the bakers for their charges, labour, and profit ; and it directs by what authority, and according to what rule, such assize shall be so set ; and it appears by the tables inserted, that the respective weights of the several assized loaves are to *decrease* exactly in the same ratio, as the prices of the bushel of wheat (with the allowance for baking included) *increase*. The *peck loaf* is to weigh, when well baked, 17 lb. 6 oz. avoirdupois weight, and the others in proportion ; and every sack of meal is to weigh 2 cwt. and 2 qrs. neat ; and from every sack of meal there ought to be produced on the average 20 peck loaves of bread. The 41 Geo. 3. c. 12. provides for the price and weight of bread of the other qualities and descriptions of bread already noticed, and directs that every loaf of inferior wheaten bread shall be marked with a Roman H, and every loaf of mixed or maslin bread with a Roman X, under severe penalties.

All the statutes, from 31 Geo. 2. in succession, make the adulteration of flour with noxious ingredients, such as alum, &c., an offence punishable, summarily, by fine ; but the 36 Geo. 3. c. 22. particularly defines the meaning of the term adulteration, by declaring that it extends to any other mixture than *common salt, pure water, eggs, milk, yeast, and barm*, or other such leaven as shall be allowed.

And even the possession of unlawful ingredients by a miller, baker, or seller of bread, is declared to be unlawful by 31 G. 2. and punishable by fine ; as well as the hindering or obstructing any person lawfully authorized from searching for the same.

These, and other statutes relating to the subject of bread, were reviewed, and their provisions extended, so far as respects the kingdom in general, by 50 Geo. 3. c. 73., and by 53 Geo. 3. c. 116. ; but as the alterations introduced by these rather affect the detail than the principles of the preceding statutes, they are not necessary to be further noticed here. *See 3 Dick. Pract. Expos.* 74.

The 55 Geo. 3. c. 99. is the last statute on this subject, and only relates to the *city of London and liberties thereof, and a circle of ten miles from the Royal Exchange*. It notices all the anterior statutes, and repeals them so far as relates to the *specified limits*, and then proceeds to abolish the assize within said limits, and to re-enact most of the former provisions respecting the weight, adulteration, &c. of bread sold therein, with such variations, as rather affect the *manner of the proceedings*, than the *principle* of the provisions themselves. *Id.* p. 99.

BREECHINGS, the ropes with which the great guns are lashed or fastened to the ship's side. They are thus called, because made to pass round the breech of the gun. This term is also applied to a part of the harness by which horses are enabled to resist the propensity to acceleration of carriages on declivities.

BRENTA, a liquid measure used at Rome. See **WEIGHTS AND MEASURES**.

BREVIER, among printers, a small kind of type or letter, between nonpareil and bourgeois.

BREWING, the art of making beer or ale. Malt liquor is essentially composed of water, the soluble parts of malt and hops, and of yeast. There are several kinds of malt, which are distinguished by their colour, and the colour depends upon the mode of malting and drying. See **MALT**. Whether the pale or the brown malt is used, it must be coarsely ground, or bruised between rollers, which is to be preferred. The next consideration in brewing is the quality of the water to be employed; and here soft water is universally allowed to be preferable to hard, both for the purposes of mashing and fermentation. Transparency is however more easily obtained by the use of hard than soft water. But it is not well adapted to the brewing of porter, or such beers as require a fulness on the palate. Where there is liberty of choice, a preference should doubtless be given to that water, which, from natural purity, is equally free from saline substances and vegetable putrefactions, is totally flavourless, inodorous, and colourless; whence it is the better prepared for the reception and retention of such qualities as brewing is to communicate.

The first step in the process of brewing is mashing, which is performed in a large circular wooden vessel, shallow in proportion to its extent, and furnished with a false bottom, pierced with small holes, and moveable, or fixed a few inches above the real bottom. There are two side openings in the interval between the real, and false, bottom; to one is fixed a pipe for the purpose of conveying water into the tun, and the other of drawing the liquor out of it. The malt is to be strewed evenly over the false bottom of the same tun, and then by means of the side pipe, a proper quantity of hot water is introduced from the upper copper. The water rises up through the malt, or as it is called, the grist, and when the whole quantity is introduced, the mashing begins, the object of which is to effect a perfect mixture of the malt with the water, so that the soluble parts may be extracted by it: for this purpose, the grist is incorporated with the water by means of iron rakes, and then the mass is beaten and

agitated by long, flat, wooden poles, resembling oars, which are either worked by the hand, or by machinery connected with a steam-engine, or some other moving power. When the mashing is completed, the tun is covered in to prevent the escape of the heat, and the whole is suffered to remain still, in order that the insoluble parts may separate from the liquor: the side hole is then opened, and the clear wort allowed to run off; slowly at first, but more rapidly as it becomes fine, into the lower or boiling copper.

The chief thing in mashing is temperature of the mash, which depends on the heat of water, and on the state of the malt. If the water were let in upon the grist boiling hot, the starch which it contains would be dissolved and converted into a gelatinous substance, in which all the other parts of the malt, and most of the water, would be involved beyond recovery. The most eligible temperature appears to be 185° to 190° of Fahrenheit: for the first mashing the heat of the water must be somewhat below this temperature, and lower in proportion to the dark colour of the malt made use of; for pale malt, the water may be 180°, but for brown, it ought not to be more than 170°. The wort of the first mashing is always by much the richest in saccharine matter; but to exhaust the malt, a second and a third mashing is required, in which the water may be safely raised to 190° or upwards. The proportion of wort to be obtained from each bushel of malt, depends entirely on the proposed strength of the liquor. It is said that 25 or 30 gallons of good table beer may be taken from each bushel of malt. For ale and porter of superior kinds, only the produce of the first mashing, or six or eight gallons, is to be employed. Brewers make use of an instrument called a sacchrometer, to ascertain the strength and goodness of the wort, though it shows the specific gravity of the wort, rather than the exact quantity of saccharine matter which it contains.

Boiling and hopping. If only one kind of liquor be made, the produce of the three mashings is to be mixed together; but if both ale and table-beer are required, the wort of the first, or of the first and second mashings is appropriated to the ale, and the remainder is set aside for the beer. All the wort destined for the same liquor, after it has run from the tun, is transferred to the large lower copper, and mixed with a certain proportion of hops. The better the wort, the more hops are required. In private families, a pound of hops is sometimes used to every bushel of malt: but in public breweries, a much smaller proportion is deemed sufficient. When both ale and table-beer are brewed from the same malt, the usual practice is to put the whole quantity of hops in the ale wort, which having

been boiled some time, are to be transferred to the beer wort, and with it to be again boiled; but in private families, where good small beer is sometimes considered a great luxury, a small quantity of fresh malt, as well as of fresh hops, is usually added for the beer.

When the hops are mixed with the wort in the copper, the liquor is made to boil, and the best practice is to keep it boiling as fast as possible till upon taking a little of the liquor out, it is found to be full of small flakes like those of curdled soap.

The boiling copper is in common breweries uncovered; but in many on a very large scale, it is fitted with a steam-tight cover, from the centre of which passes a pipe, that terminates by several branches in the upper or mashing copper: the steam, therefore, produced by the boiling, instead of being wasted, is let into the cold water, and thus raises it very nearly to the temperature required for mashing, besides impregnating it very sensibly with the essential oil of the hops, in which the flavour resides.

When the liquor is boiled, it is discharged into a number of coolers, or shallow tubs, in which it remains until it becomes sufficiently cool to be submitted to fermentation. It is necessary that the process of cooling should be carried on as expeditiously as possible, particularly in hot weather, and for this reason, the coolers in the great brewhouses are very shallow. Liquor made from pale malt, and which is intended for immediate drinking, need not be cooled lower than 75 or 80 degrees: of course, this kind of beer may be brewed almost in the hottest weather: but beer brewed from brown malt, and intended to be kept, must be cooled to 65 or 70 degrees, before it is put into a state of fermentation. Hence the spring and autumn have ever been deemed the most favourable seasons for the manufacture of the best malt liquor.

Tunning and barrelling. From the coolers the liquor is to be transferred to the working tun, and with it is to be mixed a gallon of yeast to four barrels of beer. In four or five hours the fermentation begins, and it requires from 18 or 20 hours to 48, before the wort is fit to be put into barrels. In the barrels the fermentation again goes on, and during a few days, a copious discharge of yeast takes place from the bung-hole, and care must be taken that the barrels are carefully filled up every day with fresh liquor: this discharge gradually becomes less, and in about a week it ceases; at which time the bung-hole is closed, and the liquor is fit for use after it has stood a certain time according to its strength, and the temperature at which it has been fermented.

All public breweries are subject to the laws of excise, as well as to other statutable regulations. See 3 *Dick. Pract. Expos.* 6.

BREWING, among distillers, denotes the method of extracting the more soluble parts of vegetables with hot water, and thus procuring a solution or decoction fitted for vinous fermentation. In this sense brewing is a necessary step towards distillation. A fermentable solution fit for yielding a spirit, is obtainable from almost any vegetable, under proper management. Malt is generally used in England, and brewed for this purpose. The worst malt will serve for distillation; and the infusion or wort, without the addition of hops, and the trouble of boiling, is here directly cooled and fermented. See **DISTILLING**.

BRIBERY, (from the Fr. *briber*, to devour or eat greedily,) is a high offence, where a person in a judicial place takes any fee, gift, reward, or brocage, for doing his office, but of the king only. 3 *Inst.* 145. But taken largely, it signifies the receiving or offering any undue reward to, or by any person concerned in the administration of public justice, whether judge, officer, or the like, to act contrary to his duty; and sometimes it signifies the taking or giving a reward for a public office. 3 *Inst.* 9. To take a bribe of money, though small, is a great fault; and judges' servants may be punished for receiving bribes. And though a bribe be refused, the offerer is punishable. *Fortescue*, c. 51.

BRICKS, (GER. *Ziegelsteine*. DU. *Tegelsteenen*. DA. *Tegle*, *Tegelestene*. SW. *Tegel*, *Tegelstenar*. FR. *Briques*. IT. *Mattoni*. SP. *Ladrillos*. PORT. *Ladrilhos*. RUS. *Kirpitsch*. POL. *Cegly*), are made of earth, of the aluminous or argillaceous kind, formed into shape by means of a wooden mould, and then baked or burnt. The common bricks are parallelograms, of which the length and breadth are prescribed by statute; viz. by 17 Geo. 3. c. 42. all bricks made in England for sale shall be 8½ inches long, 2½ inches thick, and 4 wide; and all pantiles 13½ inches long, 9½ inches wide, and ¾ inch thick; on pain of forfeiting for bricks or tiles made of less dimensions when burnt, as follows, viz. 20s. for every 1000 of bricks, and 10s. for every 1000 of pantiles. *Ibid.*

Mashes of sieves, for screening sea-coal ashes, not to be more than a quarter of an inch asunder. *Ibid.*

Bricks, amongst us, are various, according to their various uses, methods of making, &c. There are, compass bricks, of a circular form, used in steining walls: concave, or hollow bricks, on one side flat like a common brick, on the other hollowed, and used for conveyance of water; feather-edged bricks, cogging bricks, coping bricks, paving bricks, and others.

Statute bricks, or small common bricks, ought, when burnt, to be nine inches long, four broad, and two and a half thick.

The art of brick making is, in almost all

its branches, regulated by different acts of parliament. Bricks are made of clay mixed with sand or ashes, or with both. The clay is first moistened and tempered with water, to render it fit for moulding into bricks. Several persons are usually employed in making a single brick: these are called a gang, and they consist of one or two men, a woman, and two children, to each of whom is assigned a different department in the occupation. A gang in full work will make many thousand bricks in the course of a week. When the bricks are made and sufficiently dried, they are burnt in a kiln. The great art in this part of the process is in piling the bricks, so that the fire may circulate through every course, and in all directions. Bricks, when finished, are of different colours, according to the clay of which they are made. Woolpit, in Suffolk, is celebrated for a species of beautiful *white* brick.

The brick-trade is under the excise, and the persons employed in it must give proper notice to the officers of excise, before they begin to work, of their names and places of abode, sheds, warehouses, &c.; and the officers may, at any time, enter and take accounts of the bricks, either on the field, or whilst drying in the shed; and removing, or fraudulent concealment, or obstructing the officers, incurs a forfeiture of such bricks and tiles, with several other penalties.

Brickmakers, or their workmen, are to make entries in writing, upon oath, specifying the quantities and sorts of bricks, tiles, &c. and to pay the duties within six weeks after making their entries, under penalty of 50*l.* and double duties.

Bricks and tiles, for which all duties have been paid, exported, are entitled to drawbacks; but six hours' notice must be given to officers, and the exporters are to give security for due exportation in treble the amount; and if such bricks or tiles are landed after having been shipped, they shall be forfeited, together with the penalty of the bond.

Persons making bricks of more than ten inches in length, three thick, and five in width, except draining bricks, shall pay an additional 5*s.* per thousand.

The 17 Edw. 4. c. 4. was the first statute which regulated the making of tiles. For exemptions from duty on tiles for purposes of drainage, see 34 Geo. 3. c. 15. 42 Geo. 3. c. 93. 46 Geo. 3. c. 153. and 55 Geo. 3. c. 176.

BRIDLE-CUTTER. This is a business set up to serve the saddler, in the same manner as the leather-cutter is set up for the service of the shoe-maker: and his business differs from that of the leather-cutter (who cuts out and retails the leather for shoes) in his cutting out and selling only the leather

for saddles and bridles to the saddler who makes them up.

BRIGANTINE, a light small ship. It is also applicable to a coat of mail, a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

BRILLIANTS, (GER. *Brillianten*. DU. *Brillanten*. DA. and SW. *Brillanter*. FR. *Brillants*. IT. *Brillanti*. SP. *Brillantes*. PORT. *Brilhantes*. RUS. *Brilianti*.) The finest diamonds. See **DIAMOND**.

BRIMSTONE, (GER. *Schwefel*. DU. *Zwafel*, *Zolfer*. DA. *Svovel*. SW. *Swafvel*. FR. *Soufre*. IT. *Zolfo*, *Solfo*. SP. *Azufre*. PORT. *Enzofre*. RUS. *Sjera*. POL. *Siarka*. LAT. *Sulphur*.) See **SULPHUR**. *Brimstone* medals, figures, &c. may be cast from a composition consisting of equal weights of sulphur and vermilion melted together. When cleared the composition may be cast in a mould smeared with oil. If it should change to a yellowish hue, wet it with aquafortis, and it will have the appearance of fine coral.

BRINE-PANS, the pits in which salt water is retained, and suffered to stand, to bear the action of the sun, by which it is converted into salt.

BRINE-PIT, the salt spring from which the water to be boiled into salt is taken. There are many of these springs in this country; that at Nantwich, in Cheshire, is said to be sufficient to yield salt for the whole kingdom.

BRING-to, is to check or retard the velocity or rate of sailing of a ship, by arranging the sails in such a manner, that they shall counteract each other, and thus preventing her either from advancing a-head, or getting stern-way.

BRINING of grain, the practice of immersing it in some sort of liquor or pickle to prevent smut, or other diseases, and also to guard it from the ravages of insects. Mr. Arthur Young, in his *Farmer's Calendar*, says, that from various experiments it appears, that steeping wheat from twelve to twenty-four hours in a ley of wood-ashes, in lime-water, and in a solution of arsenic, will give clean crops from extremely smutty seed.

BRINING of hay, the blending of salt with hay in the operation of stacking, to preserve and render it palatable. This practice is useful in rainy seasons, and it prevails chiefly in America. It has been discovered to be a sovereign preventive against the rot in sheep.

BRISTLES, (GER. *Borsten*. DU. *Borstels*. DA. *Börster*. SW. *Borst*. FR. *Soies*. IT. *Setole*. SP. *Cerdas*, *Setas*. PORT. *Sedas*, *Cerdas*. RUS. *Schtschetina*. POL. *Szczeciny*.) the strong hair standing on the back of a hog, or wild boar. They are put to several uses, particularly in making various sorts of

brushes. Wild boars' bristles are much stronger than hogs', and are much more valued; but they are also much dearer. Shoe-makers, harness-makers, and saddlers, use them, by putting one of them as a needle or awl at the end of their thread, to sew their work. Bristles are principally imported from Russia.

BROCADE, (GER. *Brokat*. DU. & SW. *Brokade*. DA. and FR. *Brocade*. IT. *Broccato*. SP. & PORT. *Brocado*. RUS. *Partscha*. POL. *Złotogłowa*.) a stuff composed of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the manufacturers. Formerly the word signified only a stuff, woven all of gold, both in the warp and in the woof, or all of silver, or of both mixed together; thence it passed to those of stuffs in which there was silk mixed, to raise and terminate the gold and silver flowers: but now all stuffs, even those of silk alone, whether they are programs of Tours or of Naples, satins, and even taffeties or lustrings, if they are but adorned and worked with some flowers, or other figures, are called brocades.

BROKER, a name given to persons of several and very different professions, the chief of which are exchange-brokers, stock-brokers, pawn-brokers, and brokers simply so called, who sell household furniture, and second-hand apparel.

BROKERS, *Exchange*, are a kind of agents or negotiators, who contrive, propose, and conclude, bargains between merchants, and between merchants and tradesmen, in matters of bills of exchange, or merchandise, for which they have so much commission. These, by the statute of 8 & 9 W. 3. are to be licensed in London by the Lord Mayor, who administers to them an oath, and takes bond for the faithful execution of their offices. If any person shall act, as a broker, without being thus licensed and admitted, he shall forfeit the sum of 500*l*. and persons employing him 5*l*. and brokers are to register contracts, &c. under the like penalty: also brokers shall not deal for themselves, on pain of forfeiting 200*l*. They are to carry about with them a silver medal, having the king's arms, and the arms of the city, and pay 40*s*. a-year to the chamber of the city. The exchange-brokers make it their business to know the alteration of the course of exchange, to inform the merchant how it goes, and to give notice to those who have money to receive or pay, beyond sea; they are the proper persons for negotiating the exchange, and when the matter is accomplished, that is, when the money for the bill is paid, and the bill delivered, they have for brokerage 2*s*. for every 100*l*. sterling.

BROKERS, *Stock*, are those employed to buy and sell shares in the joint stock of a company, or in the public funds. The negotiations of these brokers are regulated by

certain acts of parliament, which, among other things, enact, that contracts in the nature of wagers, incur a penalty of 500*l*. and by the sale of stock, of which the seller is not possessed, and which he does not transfer, a forfeit of 100*l*.; and contracts for the sale of any stock, of which the contractors are not actually possessed, or to which they are not entitled, are void, and the parties agreeing to sell, &c. incur a penalty of 500*l*. Brokers keep a book in which all contracts, &c. shall be regularly entered. 7 Geo. 2. c. 8. and 10 Geo. 2. c. 10.

BROKERS, *Pawn*, are persons who keep shops, and lend money to necessitous people, upon pledges on interest. This trade is regulated by statutes, which prevent the demand of exorbitant interest; which prohibit pawnbrokers from purchasing goods in their custody, and from lending money to any person appearing to be under twelve years of age, or intoxicated. See further title PAWNBROKERS.

BROKERS, simply so called in their character of appraisers and sellers of goods distrained for rent, are regulated by 57 G. 3. c. 93. which enacts that no such person making any distress for rent where the sum due does not exceed 20*l*., shall take more than the following sums; viz.

For levying	-	-	£0	3	0
For men keeping possession, per					
day	-	-	0	2	0
Advertisements, if any	-	-	0	10	0
Catalogues, sale, commission, &c.					
in the pound on the net produce	0	1	0		
Stamp duty	-	-			

under a penalty of treble the amount of the money unlawfully taken, with costs, to be recovered summarily before a justice of the peace.

BROKERAGE, is a commission, or per-centage paid by merchants to brokers either for the sale or purchase of goods, bills of exchange, stock, &c.

BRONZE, (GER. *Stückgut*, *Stückmetall*. DU. *Stückgoed*. DA. *Stykmetall*. SW. *Canonmetall*. IT. *Bronzo*. SP. *Metal de Canones*. PORT. *Metal de cannoes*. LAT. *Metallum tormentorum*.) a compound metal, composed of from 6 to 12 parts of tin combined with 100 parts of copper. This alloy is heavier than copper, and possesses more tenacity; it is more fusible, and less liable to be altered by exposure to the air. This composition is used for the fabrication of cannon as well as medals.

BRONZES, a name given by antiquarians to figures either of men or beasts, to urns, and, in general, to every piece of sculpture which the ancients made of bronze. We likewise give the name of bronzes to statues and beasts of bronze, whether the pieces be copies of antiques, or original subjects. See title BUSTS.

BRONZING, the art of varnishing wood, plaster, ivory, &c. so as to give them the colour of bronze. There are two sorts of compositions used for this purpose, the red and the yellow; the latter is made of the finest copper dust, and to the former is added a small quantity of red ochre, well pulverized. Both are applied with a varnish, and the work is dried over a chafing-dish as soon as bronzed.

BROOMING, or **BREAMING**, a ship, is burning off the filth she has contracted on her sides, with furze, straw, reeds, &c.

BROOMS, (GER. *Besen*. DU. *Bezemmen*. DA. *Koste*. SW. *Qvastar*. FR. *Balois*. IT. *Scope*, *Granate*. SP. *Escobas*. PORT. *Vassouras*. RUS. *Metlii*. POL. *Miotly*.) are principally made of birch or heath. Vast quantities are manufactured in Southwark, for the supply of the London market.

BROWN, among dyers, painters, &c. a dusky colour, inclining towards redness. Of this colour there are various shades or degrees, distinguished by different appellations; as Spanish-brown, a sad-brown, a tawny-brown, London-brown, a clove-brown, &c.

Spanish-brown is a dark dull red, of a horse-flesh colour. It is an earth, and is of great use among painters, being generally used as the first and priming colour laid upon any kind of timberwork in house-painting. That which is of the deepest colour, and freest from stones, is the best. Though this is of a dirty brown colour, yet it is not much used to colour any garment, unless it be an old man's gown; but to shadow vermilion, or to lay upon any dark ground behind a picture, or to shadow yellow berries in the darkest places, when lake is wanted, &c. It is best and brightest when burnt in the fire till it is red-hot, although to colour a hare, horse, dog, &c. it should not be burnt; but, for other uses, it is best when it is burnt, as for instance, for colouring wood, posts, bodies of trees, or any thing else of wood, or any dark ground of a picture.

The method of dyeing browns, is by plunging cloth in a boiling bath of red wood ground and nutgalls bruised; and when it has boiled for two hours and a half, and has been cooled and aired, it is plunged again in the same bath, to which a proportionable quantity of copperas must first be added. The more dull you would have the brown, the more copperas must be in.

BRUISER, the name of a concave tool used for grinding and polishing the specula or glasses of telescopes. It is made of brass about a quarter of an inch thick, and hammered as near the gauge as possible. It is tinned on the convex side, and made equally broad at the bottom and top. By this instrument the speculum is prepared for the hands of the polisher.

BRUSHES, (GER. *Bürsten*. DU. *Borstels*. DA. *Börster*. SW. *Borstar*. FR. *Brosses*. IT. *Setole*, *Spazzole*. SP. *Brozas*, *Cepillos*, *Escobillas*. PORT. *Escovas*. RUS. *Schtschetki*. POL. *Szczotki*.) are made with hogs' bristles, which are picked, combed, and cut into lengths for the various kinds of brushes; as clothes-brushes, shoe-brushes, hat-brushes, comb-brushes, &c. The wooden part of the brush is formed with an instrument similar to that used by the last-makers.

BRUTE-WEIGHT, is the gross weight of cases, or packages of merchandise, without the deduction of tare or tret.

BUCCANEERS, a sort of rovers at sea, who cruise about in privateers to take all the vessels and small craft they can meet with. This denomination was given by the French to some of the natives of the West Indies who opposed them, and has been commonly bestowed on all sorts of predatory warfare both by sea and land.

BUCENTAUR, a galeass, or great galley of the doge of Venice, adorned with fine pillars on both sides, and gilt over from the prow to the stern.

BUCKLER, a piece of defensive armour used by the ancients. It was worn on the left arm, and was composed of wickers woven together, or wood of the lightest sort, but most commonly of hides, fortified with plates of brass or other metal.

BUCKLES, (GER. *Schnallen*. DU. *Gespen*. DA. *Spænder*. SW. *Spännar*. FR. *Boucles*. IT. *Fibbie*. SP. *Hebillas*. PORT. *Fivelas*. RUS. *Präshki*. POL. *Przaczki*.) are manufactured of silver, steel, brass, iron, &c. of every description, at Birmingham. Shoe-buckles, though formerly worn by all ranks of persons in this country, are at present very little in use. We have no great demand for them from abroad.

BUCKRAM, (GER. *Schetter*, *Steife Leinwand*. DU. *Trielfe*. DA. *Dvalg*, *Dvelg*. SW. *Dvelk*, *Dvülk*. FR. *Bougran*. IT. *Tela collata o gommata*. SP. *Bucaran*. PORT. *Olandilha*. RUS. *Kleanka*. POL. *Plotno*, *Krezepkie grube*.) a sort of coarse cloth made of hemp, gummed, calendered, and dyed several colours. It is put into those places of the lining of a garment which are to be stiff, and intended to keep their forms. Sometimes new pieces of linen cloth are used to make buckrams, but most commonly old sheets and pieces of old sails.

BUCK-WHEAT, (GER. *Buchweizen*. DU. *Boekweit*. DA. *Boghvede*. SW. *Bohvete*. FR. *Sarrasin*, *Blé noir*. IT. *Grano*, *Saraceno*, *Faggina*, *Fraina*. SP. *Trigo Saraceno*, *Trigo negro*. PORT. *Trigo Saraceno*, *seu negro*. RUS. *Gretscha*. POL. *Tatarea*, *Gryka*, *Po-hanca*. LAT. *Fagopyrum*.) This wheat is a native of Africa, but is so hardy that it will thrive in almost every soil and climate. It grows to a large size; when ripe is of a deep yellow colour, and yields a very fair

flour, although the outer skin of the grain is blackish. Its chief excellence consists in food for poultry.

BUDDUNCAS, a species of Bengal muslins. *E. Ind. Co.*

BUFF, (GER. *Büffel*, *Büffelhäute*. DU. *Buffelsleër*, *Buffelshuiden*. DA. *Büffelæder*, *Buffelhuder*. SW. *Buffelhudar*. FR. *Buffle*, *Peau de buffles* et *Peaux passées en buffles*. IT. *Bufalo*, *Cuojo di bufalo*. SP. *Ante*. PORT. *Couro de bufalo*,) a sort of leather prepared from the skin of the buffalo, dressed with oil, after the manner of chamois. This makes a very considerable article in the French, English and Dutch commerce at Constantinople, Smyrna, and along the coast of Africa. The skins of elks, oxen, and other like animals, when prepared after the same manner as that of buffalo, are likewise called *buffs*. Of buff-skin, or buff-leather, are made a sort of coats for the horse or *gens d'armes* of France, likewise bandaliers, belts, pouches, and gloves.

BUFFALO, a kind of wild ox, or bull, whose hides are an article of commerce, and are imported from America in large quantities.

BUFONITES, a fossil, called the *toad-stone*. It is usually of one uniform colour; but some are found mottled and variegated, the yellowish ones with black, and the brown with a pale greyish colour. Some few are found with a spot in the centre, surrounded with a number of concentric circles of various colours. These are the most beautiful of all.

BUGGASINS, a name given to buckrams made of calico.

BUGLES, (GER. *Glasperlen*, *Glaskorallen*. DU. *Venetiaanse paren*. DA. *Glaskoraller*. SW. *Glaspärlor*. FR. *Verroterie*, *Rassade*, *Rocaille*. IT. *Contaria*, *Margheritine*. SP. *Abalorios*, *Rocalla*, *Vidrieria*. PORT. *Missanga*, *Aljofar*. RUS. *Bisser i Dekui*. POL. *Koralki sklane*,) are small glass beads of different colours, of which large quantities are exported to Africa, and there bartered on the coast, for slaves, ivory, gums, &c. &c.

BUILDINGS, laws concerning. The buildings of London are regulated by what is denominated the Building-act, which repeals and amends several former acts for the same purpose. It was passed in the year 1774, and begins by dividing all buildings into seven rates or classes, for the purpose of subjecting them to various regulations respecting the thickness of the walls, &c. Surveyors of districts are appointed to see the rules and regulations of this act properly complied with. Before any building is begun to be erected, the master workman is bound to give twenty-four hours notice to the surveyor, who is to attend and view the building, and enforce the observance of the act. The fees to be paid by the builder to

the surveyor are, for a building of the first rate 3*l.* 10*s.* and for an alteration or addition 1*l.* 15*s.* : for a building of the second rate, 3*l.* 5*s.* and for an alteration, 1*l.* 10*s.* : for the third rate, 2*l.* 10*s.* and 1*l.* 5*s.* ; and for a fourth rate, 1*l.* 1*s.* and 15*s.*

The following is an abstract of the 14th Geo. 3. c. 78. which reduces into one act all preceding acts relative to building.

All buildings in London and Westminster and within the bills of mortality, Saint Mary-le-bone and Paddington, Saint Pancras and Saint Luke at Chelsea, of whatever description such building may be, shall be divided into seven rates or classes, which shall be under the following regulations :

Every church, chapel, meeting-house, and other place of public worship, and every house or building for distilling and brewing of liquors for sale, for making soap, melting tallow, for dyeing, boiling, or distilling turpentine, casting brass or iron, refining sugar, making glass or chemical works for sale, of whatever dimensions soever, and every warehouse or other building not being a dwelling-house, new-built, or hereafter to be built (except such buildings hereinafter declared to be of the fifth, sixth, or seventh rates), which shall exceed three stories above ground, exclusive of the rooms (if any) in the roof, or which shall be of the height of thirty-one feet from the surface, ground, or way, above the area before either of the fronts thereof, to the top of the blocking-course or coping, on the parapet; and every dwelling-house, with the offices thereunto belonging or connected, otherwise than by a fence or fence-wall, or covered passage open on one or both sides when finished, exceeding the value of 850*l.*; and every dwelling-house exceeding nine squares of buildings on the ground-floor, each square containing one hundred superficial feet, shall be deemed the first class of building; the under side of the ground-floor, and from thence, of the thickness of one inch in length, or eight inches and a half, at least, up to the under side of the blocking-course, increasing on the parapet of every such fourth-rate building.

Thickness of party walls, to the fourth rate.

—At the foundation, two bricks in length in thickness, or one foot five inches and a half, gradually diminishing two inches and a quarter to the top of the footing in every such wall, such footing to be at least nine inches high, and full two inches below the upper surface of the pavement and flooring boards of the cellar; such party-wall, from the top of such footing, shall be of the thickness of one foot and a half in length, or thirteen inches, at least, up to the under side of the ground-floor; and from thence of the thickness of one brick in length, or eight inches and a half, at least, up to the top of every such party-wall.

Fifth Rate.—Every building which shall be at the distance of four, and within eight feet, from any public road, street, or causeway, detached from any other building, not in the same possession, full sixteen feet and not thirty feet, or connected with any other building only by a fence or fence-wall, shall be deemed of the fifth rate, and may be built of any dimensions whatsoever.

Sixth Rate.—Every building which shall be at the distance of eight feet from any public road, street, or causeway, detached from any other building, not in possession therewith, at least thirty feet, or connected with any other building only by a fence or fence-wall, shall be deemed of the sixth class, and may be built of any dimensions, with any materials whatsoever.

Seventh Rate.—Every crane-house built upon any wharf or quay, and every shamble, wind-mill, or water-mill, and every building within London and Westminster and the liberties thereof, used for workshops or drying places for tanners, fellmongers, glue-makers, size-makers, calico-printers, whistlers, whiting-makers, curriers, leather-dressers, buckram-stiffeners, oil-cloth painters, wool-staplers, throwsters, parchment-makers and paper-makers, so long as they shall be employed for some of the above purposes respectively, shall be deemed the seventh rate, and may be built of any dimensions whatsoever. All crane-houses, or additions to, or enlargements thereof, shall be of stone, brick, slate, tile, oak, elm, steel, iron, or brass; but every other building of the seventh class may be erected of any other material whatever: but no crane-house or other building of the seventh class, shall be covered with pitch, tar, or other inflammable composition, nor shall be converted into any other use.

Detached offices, or such as are connected therewith only by a fence-wall, open on both sides, shall be deemed to be of the rate of building such office would have been, if the same did not belong to any dwelling-house or building. Party-walls shall be between house and house, and other buildings, except in such parts where each have independent walls. All party-walls above four stories high, shall be built as of the first rate; and party walls to the fourth rate, being four stories high, shall be built as of the third rate. Materials of the division in first, second, third, and fourth rates, shall be of brick or stone, or artificial stone or stucco, or all these together, except the necessary timber, wood, lead, or iron work.

The rate to be ascertained by the surveyor of the district, and the building shall be valued as if the materials were sound and the work new, and at the several prices and valuations as such materials and workmanship shall be worth when such valuation was made; the squares of building to be taken on the level of the floor at the prin-

cipal entrance; and no more than such parts of the party-walls as belong to the building shall be included in such admeasurement.

Party-walls not being of sufficient thickness, are to be taken down when one of the houses is rebuilt.

External walls shall not become party-walls. Party-walls must be one foot six inches above any building; but certain recesses and openings may be made in them, and they may be cut into for certain purposes, and under particular restrictions.

Party-walls shall not extend to the Inns of Court. In cases of intermixed property, the owners may be compelled to join in building party-walls; and where such owners are under disabilities, or the houses are uninhabited, differences between them are to be settled by application to the Mayor and Aldermen, who shall issue their precept to the Sheriff of London, Middlesex, Surry, or Bailiff of the Liberty of the Tower, to impanel a jury, who shall determine the proportion of expence to be paid by each party owning the adjoining premises; and the court shall give judgment according to the verdict, which shall be recorded by the town clerk or clerk of the peace, and such judgment shall be binding; and within fourteen days after judgment and payment, or tender of the money awarded, the owner of the intermixed house may pull it down, and may enter the adjoining building, in the presence of a peace-officer, and may remove goods and furniture; and persons hindering the workmen or damaging the work shall forfeit 10*l*.

Builders shall be repaid a part of the expence of rebuilding party-walls, according to the verdict.

Old party-walls and party-arches, when decayed, may be rebuilt, the proprietors of the same giving three months' notice, according to the form prescribed by the act.

Surveyors to be appointed to view party walls and arches; and if the major part of the surveyors do not certify within one month, another surveyor is to be appointed by a magistrate.

When any walls are certified by the surveyors to be ruinous, a copy of the certificate is to be delivered to the owners of such party-walls as are ruinous, and not sufficiently secure against fire, within three days.

Owners aggrieved may appeal to the general quarter sessions, whose determination shall be final.

Owners of houses of the first, second, and third class, shall give three months' notice, in writing, before pulling down old party-walls; and owners of houses having partitions of wood, may give also three months' notice to owners of adjoining premises, to pull down the said par-

titions, and remove furniture, &c. as before directed.

Persons building party-walls or party-arches, if the adjoining building be of the same or a higher class, shall pay one moiety of the expence of building so much of the said party-wall as such owner shall make use of; and if the adjoining building be of an inferior rate, the owner of such ground or adjoining building shall give a sum equal to one moiety of the expence of building a party-wall or arch of the thickness required by this act for such class of building, and of the height and breadth of so much of the party-wall or party-arch as the occupier shall make use of; and until payment of the expences, the property of the party-walls shall be vested in the builder.

Expences of building such party-walls or party-arches shall be estimated after the rate of 7*l.* 15*s.* by the rod for the new brick-work, deducting therefrom, after the rate of 28*s.* by the rod for the materials (if any) of so much of the old wall or arch as belonged to such adjoining ground, and 2*d.* per cubic foot for the materials (if any) of so much of the old timber partitions as belonged to such adjoining building or ground.

Ten days after the party-wall is finished, an account is to be left with the owner of the adjoining buildings of what he is liable to pay, the expence of which may be recovered by action of debt in any of the courts at Westminster; and if the plaintiff, before action, gives three months' notice, and recovers his whole charge, he shall be entitled to double costs.

All party-walls shall be such as are required for the highest rate of building adjoining, and shall not be of less thickness, and they may be raised by the owner of one side; but if the owner of either side make use of them, he must contribute proportionably to the expence.

Party fence-walls may be raised by the owner of one side, but not to be used as a party-wall unless of sufficient thickness, and the owner on one side may take down a party fence-wall, and build a party-wall; and if the owner on the other side use it other than as a party fence-wall, he must contribute to the expence.

The first builder shall not lose any right of soil on account of a party-wall not being half on each ground; and if the fore and back fronts are taken down within five years, this will be deemed a rebuilding.

The breast of the chimney is not to be supported by timber, and the timber under the hearth must be eighteen inches lower than the surface of such hearth.

The hearth must be laid on brick or stone, or on the ground, and every chimney shall have a slab or slabs, or foot paces, be-

fore the same, of tile, stone, marble, or iron, at least eighteen inches broad, and at least one foot longer than the opening of every such chimney when finished, except the same be a cellar or ground floor, and be bedded on the solid earth.

No timber or wood-work whatever shall be laid in the brick-work of any oven, stove, copper, still, boiler, or furnace, nor within two feet of the inside of any such oven, copper, &c.; nor shall any wood-work whatever be laid in the brick-work of any chimney nearer than nine inches to the opening of such chimney, or five inches to the inside of the flue of any chimney, oven, stove, copper, still, &c. or nine inches to the flue of any such oven, stove, copper, &c. where any such timber shall be, or be placed nearer than five feet above the mouth of the same; and all wood-work on the frame of every chimney shall be fixed by iron nails, and no chimney shall be erected on timber.

External walls shall be of brick, stone, natural or artificial, lead, copper, tin, slate, tile, or iron, or some of these in combination; and all sash-frames and door-frames shall be set in reveals, and recessed at least four inches from the front of the building, and all story-ports and brassmms are to be but two inches in party-walls, and all corner story-ports shall be of oak or stone, and twelve inches square.

Flat gutters and roofs of the first, second, third, fourth, or fifth class of building, and every turret, dormer, or lanthorn-light, or other erection, and every external part of such flat gutter, &c. which shall be ripped or uncovered, shall be covered with glass, copper, lead, tin, slate, tile, or artificial stone, except the doors, door-frames, windows, and window-frames of such turrets or other erections.

Every coping, cornice, fascia, window-dressing, balustrade, or other external decoration or projection whatsoever, of the above classes, and every frontispiece to any building of the first class, shall externally be of brick, stone, burnt clay, or artificial stone, stucco, lead, or iron, except the cornices and dressings to shop-windows, (the covered ways not extending beyond the original line of the houses in the same street,) and such covered way shall be covered with stone, lead, copper, slate, tile, or tin; and neither the said covered way nor the cornice or dressings of any shop-window, nor the roof of any such porticoes, shall be higher than the under side of the sill of the window-frame of the one-pair-of stairs window, to which the same belongs; and no water shall be suffered to drain next to any public street, square, place, or counterway, from the roof of any building of the first, second, third, or fourth classes of building, except from the roof, porticoes, or other entrances; but all water from such

roofs shall be conveyed by lead, copper, tin, or iron gutters or pipes, or by wooden trunks, or brick or stone funnels, to the drain or channel stones, on or below the surface of the ground for that purpose, or to some cistern or other reservoir made, or to any front of such building, not abutting upon any public street or way, and every brick and stone funnel shall be in every part thereof below the pavement, and every wooden trunk below the top of the window in the ground story.

No front windows shall be built extending beyond the line of the street, except projections for decorations, shop-windows, and stall-boards; and the materials of such projections shall be the same as those before directed to be used in external walls.

Old external walls or inclosures may be repaired with the same materials.

No bow-window or projection to be rebuilt, unless originally built or within the line of the street.

No stack of warehouses to be above thirty-five squares, including internal and external walls; and there shall be no communication through party-walls unless by stone door-cases, and iron doors; and no timber shall be laid into the brick-work of any wall in any such stack of warehouses nearer than eighteen inches to the opening of such communication.

No building for stables to contain more than twenty-five squares of building, including internal and external walls, and there must be no communication door without having stone cases.

All buildings which shall be hereafter divided into distinct tenures on the ground-floor, shall be deemed separate buildings; but this not to prevent proprietors from dividing warehouses nor stables, subject nevertheless to certain restrictions.

All buildings of the fifth and sixth rates, in separate and distinct tenures, and not at the requisite distances, shall be deemed nuisances.

No iron, tin, copper, or other pipe or funnel, for conveyance of smoke or steam, shall be fixed next any public street, square, court or way, on the front of any building of the first, second, third, or fourth rate of building; nor shall there be any funnel within side nearer than fourteen inches to any timber, nor shall any brick funnel in the front extend beyond the line of the street; and every building contrary hereto shall be deemed a common nuisance, and the builder or owner shall enter into a recognizance to demolish the same.

Buildings deemed nuisances shall be taken down by order of the court, and the materials may be sold to pay the expences.

Surveyors, in London, are to be appointed by the court of aldermen, and in other places, by the quarter sessions.

Before any building shall be begun, no-

tice shall be given to the surveyor or supervisor of the district; or, in default, treble satisfaction shall be made to the surveyor, and 20*l.* penalty.

Surveyors to give information of irregular buildings, and 50*s.* penalty shall be inflicted upon workmen offending against this act.

Houses or walls which shall be hereafter built, shall be surveyed within fourteen days after the same shall be covered in, and oath shall be made and filed of their conformity to this act.

When any building is presented as ruinous, a board is to be put up for the safety of passengers.

If owners neglect to take down ruinous houses after notice, the mayor and aldermen, or overseers of the poor, may order the same to be taken down or secured, and may sell the materials and satisfy themselves out of the monies arising by such sale, and the overplus shall be paid to the owners any time within six years, on demand; but if the sale of the old materials should prove insufficient, the owners or occupiers are to make good the deficiency, and landlords are to allow all deficiencies paid by their tenants,

Not more than ten gallons of turpentine may be distilled, at one time, in houses contiguous to others, under penalty of 100*l.*

The remaining sections of this act, which contains 102 clauses, relate to engines, ladders, and regulations, relative to fire; for which see FIRE and FIREMEN.

BULBS, (*GER.* *Blumenzwiebeln.* *Du.* *Bollen.* *DA.* *Blomsterligger,* *Zvibler.* *Sw.* *Blomsterlökär.* *FR.* *Oignons de fleurs.* *Ir.* *Bulbi, Cipolte de fiori.* *SR.* *Cebollas de flores.* *PORT.* *Cebolas da flores.* *RUS.* *Lukowiki.* *LAT.* *Bulbi*), are the roots of several sorts of flowers, as tulips, hyacinths, &c. of which large quantities are imported from Holland, &c.

BULK of a ship, is her whole content in the hold for the stowage of goods.

BULK-HEADS, are partitions made athwart the ship, with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, and several other divisions. The bulk-head before is the partition between the forecabin and grating in the head.

BULLET, a ball of iron or lead, with which fire-arms are loaded. *Bullets* are of various kinds, viz. *red bullets*, made hot in a forge, intended to set fire to places where combustible matters are found. *Hollow-bullets*, or shells made cylindrical, with an aperture and a fusee at one end, which giving fire to the inside, when in the ground, they burst, and have the same effect with a mine. *Chain-bullets*, which consist of two bullets joined by a chain three or four feet apart. *Branch-bullets*, two balls joined by a bar of iron five or six inches apart. *Two*

headed bullets, called also angles, two halves of a bullet joined by a bar or chain: these are chiefly used at sea, for cutting the rigging, cables, sails, &c.

BULLION, uncoined gold or silver in the mass. These metals are so called, either when smelted from the native ore, and not perfectly refined, but melted down in bars or ingots, or in any other unwrought body of any degree of fineness. When gold or silver are in their purity, they are so soft and flexible, that they cannot well be brought into any fashion for use, without being first reduced and hardened with an alloy of some other baser metal. To prevent abuses, according to the laws of England, all sorts of wrought plate in general ought to be made to the legal standard; and the price of our standard gold and silver, the common rule whereby to set a value on their bullion, whether the same be in ingots, bars, dust, or in foreign specie; whence it is easy to conceive that the value of bullion cannot be exactly known without being first assayed, that the exact quantity of pure metal therein contained may be determined, and consequently whether it is above or below the standard.

Bullion may be insured generally as merchandise.

Bullion was originally the circulating medium of most countries, and was paid away by weight.

Bullion may be imported duty-free; it may also be exported without any duty, provided it be properly stamped at Goldsmiths' Hall, and under certain restrictions.

Formerly a certificate must be obtained from the Lord Mayor and Aldermen of London, oath having been previously made before the said court, by the owner and two or more creditable witnesses, that the same and every part thereof was and is foreign bullion; and that no part thereof was, before molten, the coin of this kingdom, or clippings thereof, or plate wrought within this kingdom.

The certificate to contain the name of the owner, the witness, and the true weight of such bullion; and an entry thereof duly made by the said court, in a book to be kept for that purpose; and such certificate to be shown to the commissioners of the customs before any certificate for exportation granted; and an entry of such bullion for exportation to be made by the commissioners of the customs.

Bullion shipped contrary to the above regulations to be forfeited, one moiety to the king, and the other to the informer; and the owner of such bullion to forfeit double the value, to be applied as aforesaid; and captains and masters of vessels, knowingly permitting such bullion to be embarked on board their vessels, to forfeit to any person suing for the same, 200*l*. 7 & 8 Will. 3. c. 17.

But by a late act, the oath above mentioned for the exportation of bullion, and the certificate, *may be dispensed with*; and the commissioners of the treasury are empowered, from time to time, to grant licences for exporting bullion (such licences specifying the nature and quantities thereof), which shall be entered in the books of the custom-house of the port from which such exportation shall be made before the same is shipped for the purpose of being exported. 45 Geo. 3. c. 49. But if the same be entered to be exported in any name but that of the true owner, it shall be forfeited, half to the king, and half to him who shall seize or discover the same.

BUNGS, (GER. *Spunde*, *Fasspunde*, DU. *Sponden*, *Bommen*. DA. *Spundse*. SW. *Sprundar*. FR. *Bondons*. IT. *Cocchiuni*. SR. *Bondones*. PORT. *Baloques*,) are stoppers of wood or cork, used for securing the mouths of barrels, and capable of being removed with facility, for the purpose of permitting the liquor contained in the vessels to ferment, &c.

BUNT, *of a sail*, the middle part of it, formed designedly into a bag or cavity, that the sail may gather more wind. It is used mostly in top-sails, because the courses are generally cut square, or with but small allowance for bunt or compass. "The bunt holds much leeward wind;" that is, it hangs much to leeward.

Seamen all agree that a bellying or bunting sail carries a vessel faster to the windward than a straight or fast sail.

BUNTING or **BUNTINE**, (GER. *Flaggen-tuch*. DU. *Vlaggedoek*. DA. *Flagduk*. SW. *Flaggduck*. FR. *Etamine à pavillon*. IT. *Stamina*, *Burato da Bandiere*. SR. *Lanilla*. PORT. *Estamenha*,) a sort of thin woollen stuff.

BUNT-line. Bunt-lines are small lines made fast to the bottom of the sails, in the middle part of the bolt-rope, to a cringle, and so are reeved through a small block, seized to the yard. Their use is to trice up the bunt of the sail, for the better furling it.

BUOY, a short piece of wood, or a close-hooped barrel, fastened so as to float directly over the anchor, that the men who go in the boat to weigh the anchor may know where it lies.

Buoy is also a piece of wood or cork, sometimes an empty cask, well closed, swimming on the surface of the water, and fastened by a chain or cord to a large stone, piece of broken cannon, or the like, serving to mark the dangerous places near a coast, as rocks, shoals, wrecks of vessels, anchors, &c.

"Stream the buoy;" is to let the anchor fall while the ship has way.

To buoy up the cable, is to fasten some pieces of wood, barrels, &c. to the cable, near the anchor, that the cable may not touch the ground in case it be foul or rocky; lest it should be fretted and cut or worn off.

BURATINE, a species of Persian raw silk.

BURBAS, a small coin at Algiers, with the arms of the Dey struck on both sides, worth half an asper. See **COINS**.

BURBER, an Egyptian piece of copper money, twelve of which make a medine. See **COINS**.

BURDEN of a ship, is its contents, or the number of tons it will carry. The burden of a ship may be determined thus: multiply the length of the keel, taken within oard, by the breadth of the ship, within board, taken from the midship-beam, from plank to plank, and multiply the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper-deck plank, and divide the last product by 94; then the quotient is the content of the tonnage required.

BUREAU, an appellation given in France and Flanders, to the principal custom-houses of every province or maritime town, where duties are paid. Also to many mercantile associations and factories in the same country, and its dependencies.

BURGEON, a printing letter or type.

BURGLARY, is the breaking and entering the house of another in the night, with intent to commit some felony.

By 11 Will. 3. c. 25. a reward of 40*l*. was to be paid by the sheriff of the county or city, to any one who will take and prosecute to conviction a burglar. But this, as well as several other statutes giving rewards on the conviction of offenders, was repealed by 48 Geo. 3. c. 70., which statute, however, enables the court to allow certain costs, and recompenses, to prosecutors, witnesses, &c.

By 10 Geo. 3. c. 48. receivers of jewels, gold, silver, or watches, *stolen by means of a burglary*, shall be subject to trial, as well before the conviction of the principal felon as after, and upon conviction shall be transported for 14 years.

BURGOMASTER, the chief magistrate of the great towns in Flanders, Holland, and Germany. The power and jurisdiction of the burgomaster are not the same in all places, every town having its particular customs and regulations. At Amsterdam there are four, whose authority somewhat resembles that of our Lord Mayor and Aldermen.

BURGUNDY, is considered as the choicest of French wines, is of a lively colour, possesses an agreeable flavour, and is of a very superior quality. It raises the spirits, but does not intoxicate like other wines which effervesce more in the stomach. The best Burgundy is made in Beaune, Nuits, Romanée, Premeau and Vougeot.

BURINE, a graver, or tool used by engravers.

BURNING GLASS, (*Burning glasses*. Ger. *Brennspiegel*, *Brenngläser*. Du. *Brand-*
176

spiegels, *Brangdlasen*. Da. *Brændspej*, *Brændglas*. Sw. *Brännspeglar*. Fr. *Miroirs ardents*, *Verrres ardents*. It. *Specchj ardenti*, *Vetro ustorio*. Sr. *Espejos ustorios*, *Vidrio ustorio*. Port. *Espelhos ustorios*. Rus. *Sashigatelnoe serkalo*.) a convex or concave glass, commonly spherical, which being exposed directly to the sun, collects all the rays falling on it into a very small space, called the focus, where wood, or any other combustible matter being put, will be set on fire. The convex burning-glasses transmit the rays of light, and in their passage refract or incline them towards the axis, having the property of lenses, and acting according to the laws of refraction.

The concave burning-glasses, or rather mirrors, being usually made of metal, reflect the rays of light, and in that reflection incline them to a point in the axis, having the property of mirrors, and acting according to the laws of reflection.

BURNISHING, the art of polishing a metalline body, by rubbing it briskly with a burnisher, or instrument of steel.

BURNISHER, a round polished piece of steel, serving to smooth and give lustre to metals. Of these there are different kinds, of different figures, straight, crooked, &c. Half burnishers are used to solder silver, as well as to give a lustre.

Book-binders burnish the edges of their books, by rubbing them with a dog's tooth. Gold and silver are burnished by rubbing them with a wolf's tooth, or by the blood-stone, or by tripoli, a piece of white wood, emery, &c.

BURR-PUMP, or **BILGE-PUMP**, differs from the common pump, in having a staff 6, 7, or 8 feet long, with a bar of wood, to which the leather is nailed, and this serves instead of a box. Two men, standing over the pump, thrust down this staff, to the middle whereof is fastened a rope, for 6, 8, or 10 to hale by, thus pulling it up and down alternately.

BURSE, or **BOURSE**, an exchange, or place of meeting for merchants.

BURSTONE, a species of stone used by millers for grinding corn, &c. Burstones are usually imported from Rouen.

BURTON, in the sea language, a small tackle, consisting of two single blocks: it may be made fast any where at pleasure, for hoisting small things in and out, and will purchase more than a single tackle with two blocks.

BUSHEL, a measure of capacity for dry goods, as grain, fruits, dry pulse, &c. containing four pecks, or eight gallons, or one eighth of a quarter. A bushel by 12 Hen. VIII. c. 5. is to contain eight gallons of wheat: the gallon, eight pounds of troy weight: the ounce twenty sterlings, and the sterling thirty-two grains, or corns of wheat, growing in the midst of the ears.

The standard bushel is kept in the ex-

chequer, and is found to contain 2145.6 solid inches; and the water with which it has been filled, weighed 1151 ounces, and fourteen pennyweights troy. By act of parliament made in 1697, it is determined that every round bushel with a plain and even bottom, being $18\frac{1}{2}$ inches in diameter, and 8 inches deep, should be esteemed a legal Winchester bushel, according to the standard in his majesty's exchequer. A vessel thus made will contain 2150.42 cubic inches. Besides the standard or legal bushel, there are several local bushels of different dimensions, in different places. But by 22 & 23 Car. 2. c. 12. all measures, except the standard Winchester measure, are declared illegal, and the persons selling by them subject to a penalty of 40s. and forfeiture of the corn; and by 55 Geo. 3. c. 43. persons are directed to be appointed in all cities, towns, &c. to examine measures, in order that no corn may be sold by any other than the legal standard measure.

BUSS, a small sea-vessel, used by us and the Dutch in the herring fishery, commonly from 48 to 60 tons burden, and sometimes more. A buss has two small sheds or cabins, one at the prow, and the other at the stern; that at the prow serves for a kitchen. See FISHERY, *White Herring*.

BUST. Divers statutes have been successively passed to encourage the arts, by vesting the property of designers, printers, engravers, &c. in them respectively, for certain periods. Upon a similar principle by 38 Geo. 3. c. 71. the property, and sole right of making, models or casts, or copies in *alto*, or *basso*, *relievo*, or otherwise, was vested in the original proprietors for 14 years. The provisions of this statute, however, not having been expressed with sufficient precision, it was amended and rendered more effectual by 54 Geo. 3. c. 56. whereby a similar exclusive right for a term of 14 years is given to the inventors and proprietors of all models, casts, and busts, in *alto*, or *basso*, *relievo*, on condition only that such inventors and proprietors put their names, with the dates of making, on every such model, &c. before the putting forth or publication thereof. And all persons making or importing, or exposing to sale, or disposing of, any pirated copy of such model, &c. shall be liable to damages in an action on the case, on condition that such action be commenced within six calendar months after discovery of the offence. And after the expiration of the said term of 14 years, if the person who originally made, or caused to be made, the said model, &c. shall be living, and shall not have divested himself of his right in the same, by sale or otherwise, previous to this act, he shall be entitled to an additional term in the same of other 14 years.

BUTT, a vessel or measure of wine, containing two hogsheads, or 126 gallons.

BUTT, or *butt-ends*, in the sea language, are the fore ends of all planks under water, as they rise, and are joined one end to another. Butt-ends in great ships are most carefully bolted; for if any one of them should spring or give way, the leak would be very dangerous, and difficult to stop.

BUTTER, (GER. *Butter*. DU. *Boter*. DA. and Sw. *Smör*. FR. *Beurre*. IT. *Burro*, *Butiro*. SP. *Manteca*. PORT. *Manteiga*. RUS. *Masslo* *Korowe*. POL. *Maslo*. LAT. *Butyrum*.) a fat unctuous substance, prepared from milk, by the process of churning. Butter is imported from Holland, and very large quantities from Cork, Waterford and Dublin; the Cork butter is packed in small firkins of about half a hundred weight each, and is of three qualities, viz. first, second, and third, under the general denomination of *Rose Cork butter*. Vast quantities of this butter are shipped for the West Indies.

The Waterford and Carlow butters are both shipped at Waterford, and are of very superior quality, and highly esteemed in the London market, where after having the salt washed out by the cheesemongers, &c. they are sold under the denomination of Cambridge butter. These butters are packed in casks, and with the Dublin butter, which is in similar packages, are shipped in large quantities in time of peace to Cadiz, Malaga, and other parts of Spain; but the Rose Cork butter is what suits the markets of Portugal, of which very large quantities are annually shipped off from Cork for Lisbon, Oporto, &c.

The laws respecting butter are as follows: 36 Geo. 3. c. 86. and 38 Geo. 3. c. 73.

Every cooper or other person who shall make any vessel for the packing of butter, shall make the same of good well-seasoned timber, tight, and not leaky, and shall groove in the heads and bottoms thereof; and every vessel made for the packing of butter, shall be a tub, firkin, or half-firkin, and no other.

Every tub shall weigh of itself, including the top and bottom, not less than 11 lb. nor more than 15 lb. avoirdupois; and neither the top nor the bottom of any such tub shall exceed in any part five-eighths of an inch in thickness; and it shall contain at least 84 lb. weight of butter.

Every firkin shall weigh at least 7 lb. including the top and the bottom, which shall not exceed four-eighths of an inch thick in any part; and every such firkin shall contain not less than 66 lb.

Half-firkins to weigh not less than 4 lb. nor more than 6 lb. including the top and the bottom, which shall not exceed the thickness of three-eighths of an inch in any part; and every such half firkin shall be capable of containing 28 lb., upon pain that the cooper or every other person making any such vessel, in any respect contrary to

the preceding directions, shall forfeit every such vessel and 10s.

Every cooper, &c. shall brand every cask or vessel before going out of his possession, on the outside, with his surname and christian name at length, in legible and permanent letters, under penalty of 10s.

Every dairyman, farmer, or seller of butter, or other person who shall pack the same for sale, shall pack it in vessels made and marked as aforesaid, and in no other, and shall properly soak and season every such vessel; and on the inside, and on the top on the outside, shall brand his christian and surname at length, in permanent and legible letters; and shall also, with an iron, brand on the top on the outside, and on the bouge or body of every such cask, the true weight or tare of every such vessel, when it shall have been soaked and seasoned; and also, with an iron, shall brand his christian and surname at length, on the bouge or body of every such vessel, across two different staves at least, and shall distinctly, and at length, imprint his christian and surname upon the top of the cask, with which such butter is filled, under the penalty of 5*l.* for such omission.

Every tub of butter shall contain, exclusive of the tare, of good and merchantable butter 84lb.; every firkin 28lb.; every half firkin, 14lb.; and no old or corrupt butter shall be mixed, or packed in any vessel whatever, with any butter that is new and sound; nor shall any butter made of whey, be packed or mixed with butter made of cream, but the respective sorts shall be packed separately, and the whole vessel shall, throughout, be of one sort and goodness; and no butter shall be salted with any great salt, but all butter shall be salted with small salt, nor shall more salt be intermixed with the butter than is needful for its preservation, under penalty of 5*l.* for offending against any of these regulations.

No change, alteration, fraud, or deceit, shall be practised by any dealers or packers of butter, either with respect to the vessel or the butter so packed, whether in respect to quantity or otherwise.

Every cheesemonger, dealer in butter, or other person, who shall sell any tubs, firkins, or half firkins of butter, shall deliver, in every such cask or vessel respectively, the full quantity appointed by this act, or, in default thereof, shall be liable to make satisfaction to the person who shall buy the same for what shall be wanting, according to the price for which it was sold, and shall be liable to an action for recovery of the same, with full costs of suit.

No cheesemonger, dealer in butter, &c. shall repack for sale any butter, under penalty of 5*l.* for every tub so repacked.

Nothing in this act shall extend to make any cheesemonger, dealer in butter, or other

person, liable to any of the penalties of this act, for using any of the tubs, firkins, or half firkins, after the British butter used in such vessels shall have been taken thereout, for the repacking for sale of any foreign butter, who shall, before he so repack such foreign butter, entirely cut or efface the several names of the original dairyman, farmer, or seller of butter, from every such vessel, having the name and tare of the cooper, and the tare of the original dairyman, farmer, and seller of butter, thereon; and, after the names are so effaced, shall, with an iron, brand his christian and surname, and the words *foreign butter*, upon the bouge of every such vessel, across two staves at least, to denote that such butter is foreign butter.

Persons counterfeiting or forging any of the names or marks required by this act, for every such offence shall forfeit 40*l.*

Penalties under this act, not exceeding 5*l.* to be determined by one justice, upon the evidence of one witness, and the whole shall go to the informer.

Penalties above 5*l.* to be recovered by action of debt, or information in the courts at Westminster, and the whole to the informer.

Nothing in this act to extend to the packing of butter in any pot or vessel which shall not be capable of containing more than 14lb.

BUTTOCK, of a ship, is that part of her which is her breadth right astern, from the tack upwards; and a ship is said to have a broad or narrow buttock, according as she is built, broad or narrow at the transom.

BUTTON, (*Buttons.* GER. *Knöpfe.* DU. *Knoopen.* DA. *Knapper.* SW. *Knappar.* FR. *Boutons.* IT. *Bottoni.* SP. *Botones.* PORT. *Botoes.* RUS. *Pogowizü.* POL. *Gwiziki.*) an article of dress, serving to fasten clothes tight about the body, made of metal, silk, mohair, &c. in various forms. *Metal buttons* are formed two different ways: the blanks, or bases of the button, are either pierced out of a large sheet of metal, or cast. In the latter case, the shanks are previously fixed in sand, exactly in the centre of the impression formed by each pattern, so as to have their extremities immersed in the melted metal, by which means they are firmly fixed in the button when cooled. The former process is generally used for yellow buttons, and the latter for those of white metal. The metal used for gilt buttons is an alloy of copper and zinc, containing more copper than goes to the composition of brass. This metal is rolled into sheets, and the blanks pierced out; these are then planished, if for plain buttons; but when ornamented buttons are wanted, the die is struck, unless great nicety is required, when they are wrought by the hand. The shanks, which are made with great expedition by a curious engine, are then attached to the

bottom of each button by a wire clamp, like a pair of sugar-tongs, and a small quantity of solder and resin applied to each. They are then exposed to heat on an iron plate, containing about a gross, till the solder runs, and the shank becomes fixed to the button, after which they are singly put into a lathe, and their edges turned off smoothly. The surface of the metal, which has become in a small degree oxidated by the action of the heat, is to be cleaned by means of diluted nitric acid. The next step in the business is the rough burnishing, which is done in a lathe with a hard black stone, from Derbyshire. After this comes the gilding; which is done by first covering the surface uniformly with a thin stratum of mercury, and upon this is to be laid an amalgam, made of mercury and gold; five grains of gold will cover 144 buttons, each one inch in diameter. The mercury is now to be volatilized by means of heat.

Glass buttons are composed of glass of various colours, in imitation of opal, lapis lazuli, and other stones. The glass is kept in fusion, and the button nipped out of it, whilst in its plastic state, by a pair of iron moulds, like those for casting pistol-shot, adapted to the intended form of the button; the shank having been inserted in the mould, so that it may become imbedded in the glass when cool.

Shell buttons are those which consist of a back, generally made of bone, without any shank, but corded with catgut, and covered in front with a thin plate of metal struck with a die. The backs are cut out with a brace, the bit of which is a circular saw, and the four holes through which the catgut passes, are drilled by four drills moving parallel to each other, and acting at once. They are then corded by children, who tie the catgut on the inside; the cavity is filled with melted resin, and the metal shell applied warm. The button is then pressed between two centres in a lathe, which are forced together by a weight acting on a lever, and the edge of the shell turned down, during its revolution with a small burnisher.

The substance of laws respecting buttons is as follows:

No foreign buttons made of hair, or any other foreign buttons, shall be imported, bartered, or sold, or offered to be bartered or sold in this kingdom, on pain of forfeiture; and the same penalty is inflicted for the unlawful importation of bone lace.

Justices, by their warrants, may cause all foreign buttons to be seized. 13 & 14 Car. 2. c. 15, and 4 Wm. 3. c. 10.

No person shall make, sell, or set upon any clothes or wearing garments whatsoever, any buttons made of cloth, serge, drugget, frieze, camblet, or any other stuff of which clothes or wearing garments are made, or any buttons made of wood only, and turned in imitation of other buttons, on pain of

forfeiting 40s. per dozen, for all such buttons. 4 Geo. 1. c. 7.

No taylor shall set on any buttons, or button-holes, of serge, drugget, &c. under penalty of 40s. for every dozen of buttons or button-holes, so made or set on.

No person shall use or wear, on any clothes, garments or apparel, whatsoever, any buttons or button-holes made of or bound with cloth, serge, drugget, frieze, camblet, or other stuffs, whereof clothes or woollen garments are usually made, on penalty of forfeiting 40s. per dozen, under a similar penalty. 7 Geo. 1. c. 22.

Clothes made of velvet are excepted from these regulations. All frauds respecting the manufacturing of buttons, and selling them of qualities inferior to what they are denominated on the pattern cards, &c. &c. are provided against by stat. 36 G. 3. c. 60. From the manner of wording these several statutes, numerous difficulties attend convictions under them. See 1 Dick. Pr. Ex. 248.

BUTTON-stone, a name given to a peculiar species of slate, found in some parts of Germany, that runs with ease into glass, in the course of a few hours, without the addition of any salt, or other foreign substance, to promote its vitrification. It in fact contains in itself all the principles of glass, and from it the Swedes and Germans make glass buttons, the handles of knives, and other articles.

BUTTS, or BACKS, (GER. *Ochsenleder*, *Englisches*, *Sohlleder*, *Butt*. DU. *Oseentleer*. DA. *Oxleeder*, *Studeleeder*. SW. *Oxläder*. FR. *Cuir de Bœuf*, *Cuir fort*. IT. *Cuoio di buoi*, *Cuoio forte*. SP. *Cuero de bues*. PORT. *Couro de bois*, *Couro duro*. RUS. *Bukowaja Kosha*. POL. *Wolowa skora*.) a name given to that sort of tanned leather, which is prepared from the stoutest and heaviest ox hides, and which is chiefly used for the soles of shoes.

BUYING AND SELLING, a transferring of property from one person to another, in consideration of some price or recompence. On an agreement for goods, the vendee cannot carry them away without payment, unless the vendor agrees to trust him. But, if any part of the price is laid down, or any portion of the goods delivered by way of earnest, the vendee may recover the goods by action, as well as the vendor the price of them. 29 Car. 2. c. 3.

BY-LAW, is a private law made by those who are duly authorised so to do, by charter, prescription, or custom, for the preservation of order and good government, within some particular place or jurisdiction. *Moor*, 583.

Every corporation, lawfully erected, has power to make *by-laws*, or private statutes, for the better government of the corporations; which are binding upon themselves, unless contrary to the laws of the land; and then they are void. 11 Black. 475.

BYRAMPAUTS, a species of *Surat callicoës*.

BYSSUS ASBESTINUS, a species of asbestos, or incombustible flax, composed of flexible parallel fibres. It is found plentifully in Sweden, either white, or of different shades of green. At a copper mine in Westmannland, it forms the greatest part of

the vein out of which the ore is dug; and by the heat of the furnace which melts the metal, is changed into pure semi-transparent glass.

BYSSUS, that fine Egyptian linen, of which the tunics of the Jewish priests were made.

C A B

C, the third letter of the alphabet, and a numeral letter for 100 (*Centum*) among the Romans.

CAB, a Hebrew dry measure, containing two five-sixths pints of our common measure.

CABALLEROS, or **CAVALLEROS**, are Spanish wools, of which there is a considerable trade at Bayonne in France.

CABALLINE OIL, (*GER. Kammfet. FR. Huile de Cheval*;) melted horse grease.

CABBAGES. See **ROOTS**.

CABECA, or **CABESSE**, a name given to the finest silks in the East Indies, as those from 15 to 20 per cent. inferior to these are called *barina*.

CABEER, a money of account at Mocha, 80 of which are worth about two shillings and sixpence sterling.

CABIDOS, or **CAVIDOS**, a long measure used in Goa, and other Portuguese settlements in the East Indies, to measure stuffs, linens, &c. and equal to four-sevenths of the Paris ell, or three quarters of a yard English.

CABLE, a thick, large, strong rope, commonly of hemp, which serves to keep ships at anchor. There is no merchant ship, however small, but has, at least, three cables, viz. the chief cable, or cable of the sheet anchor; a common cable; and a smaller one. Cable is also said of ropes which serve to raise heavy loads, by help of cranes, pullies, and other engines. The name of cable is usually given to such ropes as have at least three inches in diameter. Those that are less are only called ropes, of different names, according to their uses. Every cable, of whatever thickness soever it may be, is composed of three strands, every strand of three ropes, and every rope of three twists; the twist is made of more or less threads, according as the cable is to be thicker or thinner. In the manufacture of cables, after the ropes are made, they use sticks, which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable; to the end that they may all twist the better, and be more regularly wound together; and also to prevent them from twining or entangling, they hang

C A B

at the end of each strand and of each rope, a weight of lead or of stone. The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained. Thus, a cable of three inches in circumference, or one inch diameter, ought to consist of 48 ordinary threads, and weigh 192 pounds; and on this foundation is calculated the following table:

Circumf.	Threads.	Weight.
3 inches	48 —	192 pounds.
4 —	77 —	308
5 —	121 —	484
6 —	174 —	696
7 —	238 —	952
8 —	311 —	1244
9 —	393 —	1572
10 —	485 —	1940
11 —	598 —	2392
12 —	699 —	2796
13 —	821 —	3284
14 —	952 —	3808
15 —	1093 —	4372
16 —	1244 —	4976
17 —	1404 —	5616
18 —	1574 —	6296
19 —	1754 —	7016
20 —	1943 —	7772

By 25 Geo. 3. c. 56. no person shall make or sell any cordage for shipping in which any hemp is used, called short chucking, half clean, whale line, or other toppings, codilla, or any damaged hemp, on pain of forfeiting the same, and also treble the value thereof.

Cables, horsers, or ropes, made of materials not prohibited by this act, and whose quality shall be inferior to clean Petersburg hemp, shall be deemed inferior cordage, and the same shall be distinguished by marking on the tally, staple or inferior. Manufacturers making default herein forfeit for every hundred weight of cordage 10s. *Ibid.*

Manufacturers are to affix their names and manufactory, to new cordage, before sold, under the like forfeiture: and putting a false name is a forfeiture of 20l. *Ibid.*

Persons making cables of old and over-

worn stuff, containing above seven inches in compass, shall forfeit four times the value. *Ibid.*

Vessels belonging to British subjects, having on board foreign-made cordage, are to make entry thereof, on entering into any British port, on penalty of 20s. for every hundred weight. But this is not to extend to cordage brought from the East Indies; nor to materials at present used by any vessels built abroad before this act. *Ibid.*

Cable's length, is 120 fathoms. This regulates the distance of ships of war when formed into line of battle, which is ordered to be one or more cable's length.

"*Pay more cable*," is to let more out of the ship. "*Pay cheap the cable*," is to hand it out apace. "*Veer more cable*," is to let more out, &c.

"*Slip the cable*," is to let it run quite out when there is not time to weigh the anchor: this is preferable to cutting it. Before it is either cut or slipped, a spare buoy rope should be passed through the hawse-hole, and fastened near the end, with a rolling-nitch, that it and the anchor may be easily regained.

CABOLETTO, a coin of Genoa, value about three-pence sterling.

CABOTAGE, is a term in navigation, which implies a complete skill in distinguishing the proper places to anchor at, and avoiding banks, and observing the course of the tides and currents along the sea-coasts.

CACAO. See **COCOA**.

CACHALOT, a large fish of the whale species, from the brain of which *Spermaceti* is extracted.

CADDAS, are ribbons manufactured of silk and worsted; called also cruel ribbons.

CADE, a cag, cask, or barrel. A cade of herrings, is a vessel containing 500 red herrings; or of sprats, 1000.

CADENE, one of the worst sorts of carpets imported by us, from the Levant; they are sold by the piece, from one to two piastres per carpet.

CADIS, a kind of woollen stuffs manufactured at Languedoc, resembling a German serge.

CAFFA, painted cotton cloths, manufactured in the East Indies, and sold at Bengal.

CAFFILA, a company of merchants or travellers, who join together in order to go with more security through the countries on the continent of the East Indies. The caffila differs from a caravan, at least in Persia; for the caffila belongs properly to some sovereign, or to some powerful company, of Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. The Dutch have a caffila at Gombon.

CAG, or **Ksg**, of sturgeon, &c. a cask or vessel that contains from four to five gallons.

CAHYS, a dry measure for corn, used in some parts of Spain, particularly at Seville and at Cadiz. It is equal to a bushel of our measure. See **WEIGHTS AND MEASURES**.

CAIC, or **CAIQUE**, a skiff or sloop belonging to a galley. The same name is given to a small kind of barks used in the navigation of the Black Sea, and carrying from 40 to 50 men. Those used on the sea of Marmora are manned by two or three rowers.

CALABAR SKIN, (*GER. Grauwerk. Du. Graauw-werk. DA. Graawerk. Sw. Grävärk. FR. Petit-gris. IT. Varo, Vajo. SP. Gris pequeno. PORT. Gris. RUS. Bjelka. POL. Wiewiorka*.) the Siberian squirrel skin used in making muffs, tippets, and trimmings for cloths of various colours.

CALADARIS, a species of coarse calico, striped and plain, manufactured in Bengal.

CALAMANCO, (*Kalmank. Du. Kalemink, Kalmink. DA. Kalemank. Sw. Kalmink. FR. Calmande, Calmandre. IT. and PORT. Durante. SP. Calmaco. RUS. Kolo-menka. POL. Kalamayka*.) a sort of woollen stuff manufactured in England and in Brabant; it has a fine gloss, and is chequered in the warp, whence the checks appear only on the right side. Some callimancoes are quite plain, others have broad stripes adorned with flowers, some with plain broad stripes, some with narrow stripes, and others watered.

CALAMINE, or **LAPIS CALAMINARIS**, an ore of zinc, of a spongy substance, and a lax and cavernous texture, yet considerably heavy. See **ZINC**.

CALCAVELLA, properly **CARCAVELOS**, a rich, sweet, and high-flavoured white-wine, from Portugal.

CALCEDONY, a precious stone diversified with various colours, partly transparent, and partly opaque.

CALCINATION, (*FR. Calcination. GER. Calcinixen, Verkalchen*.) A substance is said to be calcined when it has been exposed to heat of a sufficient intensity to drive off all its volatile parts, but which has not become fused. The substances thus changed were formerly called calxes; the term oxides is now generally applied to them, which is more proper, as it implies the change effected in the body by the absorption of oxygen. It is not, however, proper to consider the term calcination as synonymous with oxydation, since the former implies necessarily the agency of fire, whereas oxydation may be produced as well by the action of acids, as by heat and air.

CALENDAR, a tabular statement, the days, weeks, months, feasts, &c. happening throughout the year, in their proper order.

Calendar means also a list of all the prisoners' names in the custody of each sheriff. Where prisoners are capitally con-

victed at the assizes, the usage is, for the judge to sign the *Calendar*, which contains all the prisoners' names, with their several judgments in the margin, and this calendar is left with the sheriff.

CALENDER, a machine used in manufactories, to press certain woollen and silken stuffs, and linens, to make them smooth, even, and glossy, or to give them waves, or to water them, as may be seen in mohairs, and tabbies. This instrument is composed of two thick cylinders, or rollers, of very hard and polished wood, round which the stuffs to be calendered are wound: these rollers are placed crossways between two very thick boards, the lower serving as a fixed base, and the upper moveable by means of a thick screw, with a rope fastened to a spindle, which forms its axis: the uppermost board is loaded with large stones cemented together, weighing 20,000lb. or more. It is this weight that gives the polish, and makes the waves on the stuffs about the rollers, by means of a shallow indenture or engraving cut in it.

CALICO. See **CALLICO**.

CALK, or **CAULK**. See **CAULKING**.
CALLAWAPORES, a species of calico, both blue and white, which comes from Madras.

CALLICO, (GER. *Kattun*. DU. *Katoen*. DA. *Kattun*. SW. *Cattun*. FR. *Coton*, *Toile de Coton*. IT. *Tela Bambagina*, *Tela dipinta*. SP. *Tela de Algodon*. PORT. *Pano de Algodao*. RUS. *Wúboika*. POL. *Bawelnika*.) a species of stuff made from cotton. It takes its name from Callicut, a city on the coast of Malabar, where it was first manufactured. In the East Indies the calicoes are all painted by the hand, which is performed with great expedition. From these we derive our

CALLICO-printing, which is the art of communicating different colours to particular spots or figures on the surface of the cloth, while the other parts retain their original whiteness. This art, or rather that to which we have just referred, has been practised in India for more than 2000 years. But in London Callico-printing was not introduced till about the year 1676, since which time it has been encouraged by several acts of parliament.

This art consists in impregnating those parts of the cloth which are to receive a colour with a mordant, and then dyeing it as usual with some dye-stuff or other. The dye-stuff only attaches itself firmly to that part of the cloth which has received the mordant. The whole surface of the cotton is indeed more or less tinged, but by washing and bleaching it for some days on the grass with the wrong side uppermost, all the unmordanted parts resume their original colour, while those that have received the mordant retain it. Suppose that a piece of white cotton cloth is to receive red stripes;

all the parts on which the stripes are to appear are pencilled over with a solution of acetite of alumina: after this, the cloth is dyed in the usual manner with madder. When taken out of the dyeing vessel, it is all of a red colour, but by washing and bleaching, the madder leaves every part of the cloth white, except the stripes impregnated with the acetite of alumina, which remain red. In the same manner may yellow stripes, or any other wished-for figure, be given to cloth, by substituting quercitron bark, weld, &c. for madder.

When different colours are to be given to different parts of the cloth at the same time, it is done by impregnating it with various mordants. Thus, if stripes are drawn upon a cotton cloth with acetite of alumina, and other stripes with acetite of iron, and the cloth afterwards dyed in the usual way with madder, and then washed and bleached, it will be striped red and brown. The same mordants with quercitron bark, give yellow and olive, or drab. The mordants chiefly employed in callico-printing, are acetite of alumina, and acetite of iron. These mordants are applied to the cloth either with a pencil, or by means of blocks, whereon the pattern, according to which the cotton is to be printed, is cut. As they are applied only to particular parts of the cloth, care must be taken that none of them spread to the part of the cloth which is to be left white, and that they do not interfere with one another when several are applied. If these precautions are not attended to, all the elegance and beauty of the print must be destroyed. It is necessary, therefore, that the mordants should be of such a degree of consistence, that they will not spread beyond those parts of the cloth on which they are applied. This is done by thickening them with flour or starch, when they are to be applied by the blocks, and with gum-arabic, when they are to be put on by a pencil. The thickening should never be greater than is sufficient to prevent the spreading of the mordants; when carried too far, the cotton is apt not to be sufficiently saturated with the mordants; of course the dye takes but imperfectly.

In order that the parts of the cloth impregnated with mordants may be distinguished by their colour, it is usual to tinge the mordants with some colouring matter or other. The printers commonly use the decoction of Brazil-wood for this purpose; but Dr. Bancroft has objected to this method, because he thinks that the Brazil-wood colouring matter impedes the subsequent process of dyeing. It is certain that the colouring matter of the Brazil-wood is displaced during that operation, by the superior affinity of the dye-stuff of the mordants. Were it not for this superior affinity, the colour would not take at all. Dr. Bancroft advises to colour the mordant

with some of the dye-stuff afterwards to be applied; and he cautions the using of more for that purpose than is sufficient to make the mordant distinguishable when applied to the cloth. The reason of this precaution is obvious. If too much dye is mixed with the mordant, a great proportion of the mordant will be combined with the colouring matter, which must weaken its affinity for the cloth, and of course prevent it from combining with it in sufficient quantity to ensure a permanent dye. Sometimes these two mordants are mixed together in different proportions; and sometimes one or both is mixed with an infusion of sumach, or of nutgalls. By these contrivances a great variety of colours are produced by the same dye-stuff.

After the mordants have been applied, the cloth must be completely dried. It is proper for this purpose to employ artificial heat, which will contribute something towards the separation of the acetous acid from its base, and towards its evaporation, by which the mordant will combine in a greater proportion, and more intimately with the cloth. When the cloth is sufficiently dried, it is to be washed with warm water and cow-dung, till all the flour, or gum, employed to thicken the mordants, and all those parts of the mordants which are uncombined with the cloth, are removed. The cow-dung serves to entangle these loose parts of the mordants, and to prevent them from combining with those parts of the cloth which are to remain white. After this, the cloth is thoroughly rinsed in clean water.

Almost the only dye-stuffs employed by callico-printers, are indigo, madder, and quercitron bark, or weld. This last substance, however, is but little used by the printers of this country, except for delicate greenish yellows. The quercitron bark has almost superseded it, because it gives colours equally good, and is much cheaper and more convenient, not requiring so great a heat to fix it. Indigo, not requiring any mordant, is commonly applied at once, either with a block or a pencil. It is prepared by boiling together indigo and potash made caustic by quick-lime, and orpiment; the solution is afterwards thickened with gum. It must be carefully secluded from the air, otherwise the indigo would soon be regenerated, which would render the solution useless. Dr. Bancroft has proposed to substitute coarse brown sugar for orpiments: it is equally efficacious in decomposing the indigo, and rendering it soluble; whilst it likewise serves all the purposes of gum.

We shall now give an example or two of the manner in which the printers give particular colours to callico. Some callico are only printed of one colour, others

have two, others three or more, even to the number of eight, ten or twelve. The smaller the number of colours, the more simple in general is the process.

I. One of the most common colours in cotton prints, is a kind of nankeen yellow of various shades, down to a deep yellowish brown, or drab. It is usually in stripes or spots. To produce it, the printers besmear a block, cut out into the figure of the print, with acetite of iron, thickened with gum or flour; and apply it to the cotton, which, after being dried and cleaned in the usual manner, is plunged into a potash ley. The quantity of acetite of iron is always proportioned to the depth of the shade.

II. For yellow, the block is besmeared with acetite of alumina. The cloth, after receiving this mordant, is dyed with quercitron bark, and then bleached.

III. Red is communicated by the same process; only madder is substituted for the bark.

IV. The fine light blues which appear so often on printed cottons, are produced by applying to the cloth, a block besmeared with a composition, consisting partly of wax, which covers all those parts of the cloth which are to remain white. The cloth is then dyed in a cold indigo vat; and after it is dry, the wax composition is removed by hot water.

V. Lilac, flea brown, and blackish-brown, are given by means of acetite of iron, the quantity of which is always proportioned to the depth of the shade. For very deep colours, a little sumach is added. The cotton is afterwards dyed in the usual manner with madder, and then bleached.

VI. Dove-colour and drab, by acetite of iron, and quercitron bark.

When different colours are to appear in the same print, a great number of operations are necessary. Two or more blocks are employed, upon each of which, that part of the print only is cut, which is to be of some particular colour. These are besmeared with different mordants and applied to the cloth, which is afterwards dyed as usual. Let us suppose, for instance, that these blocks are applied to cotton, one with acetite of alumina, another with acetite of iron, a third with a mixture of those two mordants, and that the cotton is then dyed with quercitron bark, and bleached. The parts impregnated with the mordants would have the following colours:

Acetite of Alumine,	Yellow.
————— Iron, - -	Olive, drab, dove.
The mixture, - -	Olive, green, olive.

If part of the yellow is covered over with the indigo liquor applied with a pencil, it will be converted into *green*. By the same liquid, blue may be given to such parts of the print as require it.

If the cotton be dyed with madder instead of quercitron bark, the print will exhibit the following colours:

Acetite of Alumine,	Red.
————— Iron,	Brown, black.
The mixture,	Purple.

When a great number of colours are to appear; for instance, when those communicated by bark, and those by madder, are wanted at the same time, mordants for a part of the pattern are to be applied; the cotton is then to be dyed in the madder bath, and bleached: then the rest of the mordants, to fill up the pattern, are added, and the cloth is again dyed with quercitron bark, and bleached. The second dyeing does not much affect the madder colours; because the mordants, which render them permanent, are already saturated. The yellow tinge is easily removed by subsequent bleaching. Sometimes a new mordant is also applied to some of the madder colours, in consequence of which, they receive a new permanent colour from the bark. After the last bleaching new colours may be added by means of the indigo liquor. The following table will give an idea of the colours, which may be given to cotton by these complicated processes.

I. MADDER DYE.

	Colours.
Acetite of Alumine,	Red.
————— Iron,	Brown, black.
————— diluted,	Lilac.
Both mixed,	Purple.

II. BARK DYE.

Acetite of Alumine,	Yellow.
————— Iron,	Dove, drab.
Lilac and acetite of alumine,	Olive.
Red and acetite of alumine,	Orange.

III. INDIGO DYE.

Indigo,	Blue.
Indigo and yellow,	Green.

Thus not less than 12 colours may be made to appear together in the same print, by these different processes. These instances will serve to give the reader an idea of the nature of callico-printing, and at the same time afford an excellent illustration of the importance of mordants in dyeing. If it were possible to procure colours sufficiently permanent, by applying them at once to the cloth by the block or the pencil, as is the case with the mordants, the art of callico-printing would be brought to the greatest possible simplicity; but at present this can only be done in one case, that of indigo; every other colour requires dyeing. Compositions, indeed, may be made, by previously combining the dye-stuff and the mordants. Thus *yellow* may be applied at once, by employing a mixture of the infusion of quercitron bark and acetite of alumine; *red*, by mixing the same mordant with the decoction of alumine, and so on. The colours applied in this way, are, un-

fortunately, far inferior in permanency to those produced when the mordant is previously combined with the cloth, and the dye-stuff afterwards applied separately. In this way are applied almost all the fugitive colours of calicoes, which washing, or even exposure to the air, destroys. As the application of colours in this way cannot always be avoided by callico-printers, every method of rendering them more permanent is an object of importance.

This branch of manufacture, like most others, is placed under the jurisdiction of the commissioners of excise.

Callico-printers, stainers, or dyers, are to take out a licence annually, on penalty of fifty pounds, and are to give notice of their names and places of abode in writing, at the next office of excise, and to pay the duty before they begin to work, on penalty of 50*l.* and forfeiture of the goods.

No goods to be kept in unentered places; and excise officers by day, or at night with a constable, may enter and take account of the goods.

Cotton of British manufacture to be stamped by the excise officers with the words *British Manufacture*, and foreign callico to be marked *Foreign Callico for Exportation*. Forfeiture and 50*l.* penalty upon persons having in their possession callico not so marked.

Goods sent by the owner to be printed, painted, &c. must be accompanied with a note, expressing the number of pieces, quality, value, and time when sent; such note to be delivered to the officer who is to take an account of the goods.

Before being sent to the officer, to be marked with a frame-mark at both ends.

Goods which have paid the duty to be kept separate.

Stamps to be provided and distributed by the commissioners of excise; counterfeiting such stamps, 100*l.* penalty and the pillory.

Goods printed within one-eighth of a yard wide, under or over, to pay as yard-wide.

Duties to be paid within six weeks after entry, on penalty of double duty.

Justices may grant warrants to search suspected places; and all goods found in the custody of persons without a stamp, shall be forfeited. 43 Geo. 3. c. 69. and 49 Geo. 3. c. 81.

CALLIPATIES, a species of Bengal calicoes.

CALOMEL, a name given to the *mercurius dulcis* six times sublimed.

CALX, literally signifies *lime*, or a sort of stone calcined in the fire; but it is used to signify any body in general after it has been calcined.

CAMBAY-STONE, a kind of cornelian brought from the East Indies.

CAMBIST, a name given in France to Bill-brokers.

CAMBLET. See **CAMLET**.

CAMBRIC, or **CAMBRICK**, (GER. *Kamertuch*. DU. *Kameryksdoek*. DA. *Kammerdug*. SW. *Kammarduk*. FR. *Cambray Batiste*. IT. *Cambraja*. SP. *Cambrai*. PORT. *Cambrãia*. RUS. *Kamertug*. POL. *Kamertuch*.) a species of very fine white linen, first made at Cambray, in French Flanders, whence it derives its appellation. Of so much repute are French cambrics, that for many years, more than 200,000*l.* per annum were expended in the purchase of them by the inhabitants of this country. Parliament interfered, and the importation of foreign cambrics is attended with heavy duties. The cambrics now used in this country are chiefly manufactured in Scotland and Ireland, and to such perfection is the manufacture arrived, that now large quantities of them are exported to America and the northern kingdoms; but these articles of French manufacture, *if legally imported*, may be sold and worn in this country; and persons wearing them, or in whose custody they are found, are not liable to any fines or penalties.

CAMEL, a large beast of burden, used throughout all the eastern countries. These animals compose the chief wealth of the Arabs. Naturalists reckon four species. They are designed by nature for travelling over hot deserts, having a fleshy foot instead of a hoof, which would be parched and cracked by arid sands.

Camel is also used (by a metaphor) for an immense machine, invented in Holland, for raising ships.

CAMELS'-HAIR, (GER. and DA. *Kameelhaar*. DU. *Kemelshair*. SW. *Kamelhar*. FR. *Poil de chameau*, *Laine de chevron*. IT. *Pelo di camello*. SP. *Pelo ó lana de cá-mello*. PORT. *Laa ou pello de camello*. RUS. *Werbljuschiü tscherst*. POL. *Kamela*, *Kamelar*.) is chiefly used in the manufacture of pencils for drawing, painting, &c. whence the name of camels'-hair pencils. The best camels' hair comes from Arabia.

CAMLET, (GER. & DU. *Kamelot*. DA. & FR. *Camelot*. SW. *Kamlot*. IT. *Ciambelotto*. SP. *Camelote*. PORT. *Camelao*. RUS. *Kamlot*. POL. *Czamlot*, *Kamlot*.) or *Camblet*, a plain stuff, composed of a warp and woof, which is manufactured on a loom, with two treadles, as linens are. There are camlets of several colours and sorts: some of goats' hair, both in the warp and woof; others, in which the warp is of hair, and the woof half hair and half silk; others again, in which both the warp and the woof are of wool; and lastly, some of which the warp is of wool and the woof of thread; some are striped, some watered, and some figured. Camlets are manufactured at Lisle, in Flanders, Arras, Amiens, and La Neuville, near Lyons, as also in Great Britain, and in the South of Ireland.

CAMOMILE, (GER. & DU. *Kamille*.

DA. *Kameel*. SW. *Kamil*. FR. *Camomille*. IT. *Camomilla*. SP. *Manzanilla*. PORT. *Camomilla*, *Macella*. RUS. *Romaschka*. POL. *Rumien*. LAT. *Chamomilla*.) a well-known plant, whose flowers are used for medical purposes. A strong sky-blue oil is distilled from them.

CAMPANINI, a name given to a marble of Italy, dug out of the mountains of Carara; because, when it is worked, it resounds like a bell.

CAMPEACHY-WOOD. See **LOG-WOOD**.

CAMPHOR, or **CAMPHIRE**, (GER. *Kampher*. DU. *Kamfer*. DA. *Kampher*. SW. *Kamfer*. FR. *Camphre*. IT. *Canfora*. SP. *Alcanfor*. PORT. *Alcanfor*. RUS. *Kamfora*. POL. *Camfora*. LAT. *Camphora*.) The *laurus camphoratus* is a tree which grows in China, Japan, and several parts of India. The wood and roots being boiled with water, the camphor rises with the steam, and is condensed (in straw placed in the capital, &c. of the still) in small granular crystals, together with another sort, apparently scraped from the cavities of the wood, and mixed with sand, ashes, &c. and purified by a second sublimation by the English and Dutch chemists. It is of various uses in medicine; as also in the arts. It enters into the composition of varnish, of sealing-wax, and of fire-works. It is so inflammable as to preserve its flame in water.

CAMWOOD, the fine red wood of Africa and of the Brasils; principally used in turnery, for the formation of the handles of knives, &c.

CANAL, a kind of artificial river made for the convenience of water-carriage. The great advantage arising to the commerce of a country furnished with navigable canals, is apparent from the success that has attended them in China, in France, in Holland, in the Netherlands, as also in Great Britain and in Ireland. There are several large canals in France; but the greatest, and one of the most useful, is the junction of the two seas, by the canal of Languedoc. Several were made during the reign of Napoleon Buonaparte. By the canals of this country, coal and all kinds of heavy merchandize are brought from every part of the kingdom to London, at nearly one half the expense of land-carriage, with great safety and expedition. See **NAVIGATION**, *Inland*.

CANAN, a liquid measure of the kingdom of Siam, which the Portuguese call choup; it contains near a pot, or two Paris pints.

CANARY-SEED, (GER. *Kanariensamen*. DU. *Kanaryzaad*. DA. *Canarifrøe*. SW. *Kanariefrö*. FR. *Alpiste*, *Graine d'oiseau*, *Graine de Canarie*, *Millet*. IT. *Seme di Canario*. SICIL. *Scagliuola*, *Scaghiola*. MALTA, *Cuneno*. SR. *Alpiste*. PORT. *Alpista*, *Arpista*.

Rus. Ranareikino Semja.) This seed is used to feed birds with, and is also employed as an article of food by many persons in this country, in the form of puddings. The grain is small, and of a white or reddish-yellow colour. Vast quantities of it are grown in the Isle of Thanet, and other parts of England.

CANCEL. To cancel any thing is, in strictness, to draw lines over it in the form of lattice-work. *2 Black. Com.* 308. Therefore, when a person obliterates any writing by drawing a pen through it, it is now said to be a *cancelling* of it.

A deed may be cancelled and avoided; 1st, by rasure, interlining, or other alteration in any material part; unless a memorandum be made thereof at the time of the execution and attestation. *11 Rep.* 27. 2dly, by breaking off, or defacing the seal. *5 Rep.* 23. 3dly, by delivering it up to be cancelled; that is, to have lines drawn over it in the form of lattice-work or *cancelli*; though the phrase is now used figuratively for any manner of obliteration or defacing of it. 4thly, by the disagreement of such, whose concurrence is necessary in order for the deed to stand; as the husband, where a feme covert is concerned; an infant or person under duress, when those disabilities are removed, and the like. 5thly, by the judgment or decree of a court of judicature. So that a deed may be avoided either in part or totally, according as the cause of avoidance is more or less extensive. *2 Black.* 508, 509.

Although a man make a last will and testament irrevocable in the strongest words, yet he is at liberty to revoke it; because his own act or words cannot alter the disposition of law so as to make that irrevocable which is in its own nature revocable: for this, said *Lord Bacon*, would be for a man to deprive himself of that which of all other things is most incident to human conditions; and that is, alteration or repentance. *2 Black.* 502.

CANDERROS, the name given to an East Indian gum; it is a pellucid white substance, which bears a good polish, and it is turned into various kinds of light toys.

CANDLE, (*Candles.* GER. *Lichter, Kerzen.* DU. *Kaarzen.* DA. *Lys.* SW. *Ljus.* FR. *Chandelles.* IT. *Candelle.* SP. & PORT. *Velas.* RUS. *Sujetschi.* POL. *Swiece.* LAT. *Candelae*.) a taper of tallow, wax, or spermaceti, the wick of which is commonly of several threads of cotton, spun and twisted together. The machine for cutting the cotton is a smooth board made to be fixed on the knees; on the upper surface are the blade of a razor and a round piece of cane, placed at a certain distance from one another, according to the length of the cotton wanted: the cotton is carried round the cane, and being brought to the razor, is instantly separated from the several balls.

A tallow candle, to be good, must be half sheep's and half bullock's tallow; for hog's tallow makes the candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted, otherwise the candle will emit an inconstant, vibratory flame, which is both prejudicial to the eyes and insufficient for the distinct illumination of objects.

There are two sorts of tallow candles; the one dipped, the other moulded: the former are the common candles. The tallow is prepared by chopping the fat, and then boiling it for some time in a large copper; and when the tallow is extracted by the process of fire, the remainder is subjected to the operation of a strong iron press, and the cake that is left after the tallow is expressed from it is called *greaves*. These are greedily eaten by dogs and other carnivorous animals.

When the tallow is in proper order, the workman holds three of the broaches, with the cottons properly spread, between his fingers, and immerses the cotton into the vat containing the tallow: they are then hung on a frame and suffered to cool; and when cold they are dipped again, and so the process is continued till the candles are of the proper size. During the operation the vat is supplied from time to time with fresh tallow, which is kept to the proper heat by means of a gentle fire under it.

The mould in which the moulded candles are cast, consists of a frame of wood, and several hollow metal cylinders, generally made of pewter, of the diameter and length of the candle wanted: at the extremity of these is the neck, which is a little cavity in form of a dome, having a moulding within, and pierced in the middle with a hole big enough for the cotton to pass through. The cotton is introduced into the shaft of the mould by a piece of wire being thrust through the aperture of the hook till it comes out of the neck: the other end of the cotton is so fastened as to keep it in a perpendicular situation and in the middle of the candle; the moulds are then filled with warm tallow, and left to cool before the candles can be drawn out of the pipes.

Besides these, there are other candles made by tallow-chandlers, intended to burn during the night without the necessity of snuffing: the wick is usually made of split rushes, or very small cotton wicks: these latter, owing to the smallness of the cotton, do not require the aid of snuffers.

To make wax-candles with the ladle.—The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended directly over a large bason of copper tinned, and full of melted wax: a large ladleful of this wax is poured gently on the top of the wicks one

after another, and the operation continued till the candle arrives at its destined bigness; with this precaution, that the first three ladles be poured on the top of the wick; the fourth at the height of $\frac{3}{4}$, the fifth at $\frac{1}{2}$, and the sixth at $\frac{1}{4}$, in order to give the candle its pyramidal form. Then the candles are taken down, kept warm, and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom. As to the manner of making wax-candles by the hand, they begin to soften the wax by working it several times in hot water, contained in a narrow but deep cauldron. A piece of the wax is then taken out, and disposed by little and little around the wick, which is hung on a hook in the wall, by the extremity opposite the neck; so that they begin with the large end, diminishing still as they descend towards the neck. In other respects the method is nearly the same as in the former case. However, it must be observed, that in the former case water is always used to moisten the several instruments, to prevent the wax from sticking, and in the latter, oil of olives, or lard, for the hands, &c. The cylindrical wax-candles are either made as the former, with a ladle, or drawn. Wax-candles or tapers drawn, are so called, because they are actually drawn in the manner of wire, by means of two large rollers of wood turned by a handle, which, turning backwards and forwards several times, pass the wick through melted wax contained in a brass bason, and at the same time through the holes of an instrument like that used for drawing wire, fastened on one side of the bason.

A patent was obtained for making candles with hollow cylindrical wicks upon the principle of the Argand lamp (*see LAMP*); but they have not succeeded to any extent.

Tallow candles with wicks slightly waxed, are now much used. Their peculiar property is that of burning down, without running or guttering.

Tallow-chandlers and wax-chandlers are by 45 Geo. III. c. 69. to take out annual licences. They shall not use melting-houses without making a true entry, and are to give notice of making candles to the excise-officer for the duties, and of the number, &c. with many other like obligations, under heavy penalties by the laws of excise.

Small rush-lights only once drawn through grease, made by persons to be used in their own houses, are not chargeable with duty.

Candles carried coastwise without a regular coquet are forfeited. Great quantities of wax candles used to be exported to Russia; but by the ukase of 1817, wax of all kinds, and wicks of all descriptions for candles, are prohibited.

CANDLE, *sale or auction by inch of*, is when a small piece of candle being lighted, the by-standers are allowed to bid for the merchandise that is selling: but the moment the candle is out, the commodity is adjudged to the last bidder.

CANDLEMAS-DAY, the feast of the purification of the Virgin Mary, being the second day of February, instituted in memory of the purification in the temple of Jerusalem, the fortieth day after her childbirth, according to the law of Moses. It is called Candlemas, or a mass of candles, because before mass was said that day, the church consecrated and set apart, for sacred use, candles for the whole year, and made a procession with hallowed candles. It is one of what are denominated the *half-quarter* days of the year.

This festival is a *dies non*, or no day in court, for the judges sit not.

CANDLESTICKS, (*GER. Leuchter. Du. Kandelaars. DA. Lysestager. Sw. Ijustakar. FR. Chandelières. IT. Candellieri. SP. Candeleros. PORT. Castiças. RUS. Podsveschniki. POL. Lichtarz.*) are of silver, brass, iron, tin japanned, or copper plated, made of different patterns and sorts. The best plated candlesticks are manufactured at Sheffield; the common sort of plated ones, as also brass, japanned, &c. are made at Birmingham.

Candlesticks are of various forms and many constructions. The telescope candlesticks, constructed on the plan of the tubes of telescopes, whereby their size may be diminished or increased at pleasure, are coming into very general use.

CANDUL, or **CANDILE**, a measure of continence used in India, at Cambays and Bengal, for rice and other grain; it contains 14 boisseaux, and weighs near 500 lb. and the gauge of ships is reckoned here by the candul, as it is by the ton in Europe; so that when it is said, a vessel is 400 canduls burden, it is to be understood she can carry 200,000 lb. or 100 tons.

It is also a weight used in China and at Galanger, of which there are two sorts; the smallest being 16 mauns; the other 20 mauns; the first makes 3 chintals good weight, and the last 3 chintals and 3 rubis; the rubis making 32 rotolis.

CANDY, or **SUGAR-CANDY**, a preparation of sugar, made by melting and crystallizing it six or seven times over, to render it hard and transparent. *See SUGAR*.

CANE, (*GER. Spanisches Rohr. Du Spaansch riet, Rötting. DA. Spanskör. Sw. Spansktrör. FR. Canne, Canne du Bengale. IT. Canna, Canna d'India. SP. Cana de Indias. PORT. Bengala.*) a walking stick. It is a reed brought from the East Indies: Some are without knots, and very smooth and even; that is, when the reed is grown so long that the distance between two

knots is large enough to make a cane. Others are full of knots, about two inches distant from each other; these last have very little elasticity, and will not bend so well as the others.

The most beautiful canes imported into England come from Bengal; some of them are so fine that they are worked into vessels, or bowls, which, being varnished over on the inside with black or yellow lacker, or of some other colour, will hold liquors, as well as glass, or china-ware does, and the Indians use them for the same purposes. Sugar-canes, from which the sugar is extracted, grow in the West Indies; for particulars of which, See SUGAR.

There are several sorts of canes or reeds, but the most remarkable and useful are as follows:

I. *Arundo bambos*, or the bamboo, a native of the East Indies and some parts of America; where it frequently attains the height of 60 feet. The young shoots are covered with a dark green bark: these when very tender are put in vinegar, salt, garlic, and the pods of capsicum, and thus afford a pickle, which is esteemed a valuable condiment in the Indies, and is said greatly to promote the appetite and assist digestion. The old stalks grow to five or six inches diameter, and are then of a shining yellow colour, and are so hard and durable that they are used in buildings, and for making all sorts of household furniture. When bored through the membranes at their joints, they are converted into water-pipes. The smaller stalks are used for walking-sticks, and the inhabitants of Otaheite make flutes of them about a foot long, with two holes only, which they stop with the first finger of the left hand and the middle one of the right, and then blow through their nostrils.

II. *Arundo donax*, or cultivated reed, is a native of warm countries, but will bear the cold of our moderate winters in the open air. The stalks of this reed are brought from Spain and Portugal, and are used by the weavers, as also for making fishing-rods.

III. *Arundo orientalis*, is what the Turks use as writing pens; it grows in a valley near mount Athos, as also on the banks of the river Jordan.

IV. *Arundo phragmites*, or the common marsh reed, grows by the sides of our rivers, and in standing waters.

CANE, is also the name of a long measure, which differs according to the several countries where it is used. At Naples, the cane is equal to 7 feet 3 inches English measure; the cane of Toulouse, and Upper Languedoc, is equal to the vane of Arragon, and contains 5 feet 8½ inches; at Montpellier, in Provence, Dauphiny, and the Lower Languedoc, it answers to 6 Eng-

lish feet 5½ inches. See WEIGHTS AND MEASURES.

CANE-HEADS, (GER. *Stockknöpfe*. DU. *Rottingknoopen*. DA. *Stockknapper*. FR. *Pommes de canne*. IT. *Pomoli*. SP. *Punos para bastones*. PORT. *Castoes, Gastoos*. RUS. *Nabalaschniki*.) are made of gold, silver, agate, ivory, amber, &c. and are principally manufactured at London and Birmingham.

CANICA, a sort of spice which grows in the Island of Cuba. It is a kind of wild cinnamon, but its taste is more like that of cloves than of cinnamon. It is a saleable commodity in the Spanish Islands.

CANNEL-COAL, a solid, dry, opaque fossil, very hard, not fusible, but easily inflammable, and burning with a bright vivid white flame. This mineral is found in Lancashire, and in different parts of Scotland, where it is known by the name of *Parrot-coal*. The colour is black, the structure sometimes slaty. It burns like a candle, and lasts but a short time. It does not cake, and leaves a stony or sooty residuum. A specimen of Lancashire cannel-coal, analyzed by Mr. Kirwan, contained

75.20 charcoal
21.68 maltha
3.10 alumina and silica.

99.98

Cannel-coal is susceptible of polish, and like jet, is frequently wrought into snuff-boxes, tea-pots, and cream-jugs, &c. &c.

CANNEQUINS, white cotton cloths made in India, about eight ells in length.

CANNON, (*Cannons*. GER. & DU. *Kanonen*. SW. *Kanon*. FR. *Canons*. IT. *Cannoni*. SP. *Canones*. PORT. *Canhoes*. RUS. *Puschki*. POL. *Dziata*.) an engine or kind of fire-arms for throwing iron, lead, or stone bullets, by the force of gunpowder. They are made wholly of iron, or of a mixture of copper, tin, and brass. They may be made by casting hollow in a machine, or by boring out of a solid block.

With regard to those which are made of mixed metals, every founder has his own proportions, which are peculiar to himself. The most common proportions of the ingredients are the following, viz.: To 240 lb. of metal fit for casting, we put 68 lb. of copper, 52 lb. of brass, and 12 lb. of tin. To 4200 lb. of metal fit for casting, the Germans put 3687½ lb. of copper, 204½ lb. of brass, and 307½ lb. of tin. Others again use 100 lb. of copper, 6 lb. of brass, and 9 lb. of tin; and lastly, others 100 lb. of copper, 10 lb. of brass, and 15 lb. of tin. Iron guns generally stand the most severe engagements, being frequently used on ship-board. Several experiments have taught us that the Swedish guns are preferable to all others.

Cannons are distinguished by the dia-

meters of the balls they carry. The rule for their length is, that it be such as that the whole charge of powder be on fire before the ball quits the piece. If it be too long, the quantity of air to be driven out before the ball, will give too much resistance to the impulse; and that impulse ceasing, the friction of the ball against the surface of the piece will take off from the motion. In former days, cannon were made much longer than they are now; but experience has taught us, that a ball moves with a greater impetus through a less space than a greater: and accordingly it is found that an iron ball of 48 pound weight goes farther from a short cannon than another ball of 96 pound out of a longer piece; whereas in other respects, it is certain, the larger the bore and ball, the greater the range. It is found too by experience, that of two cannons of equal bore, but different lengths, the longer requires a greater charge of powder than the shorter. The ordinary charge of a cannon is, for the weight of its gunpowder to be half that of its ball. See FOUNDING.

CANOE, a small boat made of the trunk of a tree, scooped hollow, and sometimes of pieces of bark sewed together. It is used by the natives of America to go a fishing, either by sea or upon the rivers and lakes. Canoes are used on the coast of Guinea, in the East Indies, and also by the savages about Davis's Streights.

CANTAR, or CANTARO, a weight used in Italy, particularly at Leghorn. There are three sorts: one weighs 150 pounds, another 151, and the third 160. The first serves to weigh alum and cheese; the second is for sugar; and the third for wool and cod-fish. The word is used also as a measure of capacity at Cochin, containing four rubis, each rubi being equal to 32 rotolis. See WEIGHTS AND MEASURES.

CANTHARIDES, or SPANISH FLIES, (GER. *Spanische Fliegen*. DU. *Spaansche vliegen*. DA. *Spanske fluer*. SW. *Spanska flugor*. FR. *Catharides*, *Mouches d'Espagne*. IT. *Cantarelle*. SPA. and PORT. *Cantaridas*. RUS. *Hischpanskije muchi*. POL. *Kantarijdi*. LAT. *Cantharides*;) are flies of a shining green colour, intermingled with somewhat of the blue, and of a golden yellow, of an acrid highly caustic taste, while fresh. They are found adhering to certain kinds of trees, in the warmer climates of Spain, Italy, and France; and sometimes in Germany. In bulk and colour they differ considerably from each other; the largest and best come from Italy: they are killed by the steam of vinegar, and then dried in the sun. *Cantharides* should be chosen large, fresh, dry, whole, and without dust; they are apt to rot upon keeping, and fall to powder, when they are good for nothing. They are commonly called *Spanish flies*. *Cantharides* are

principally used externally in making blisters; they are also occasionally given inwardly, as a powerful stimulant. They are much used in farriery.

CANTIMARONS, or CATIMARONS, a kind of float or raft, used by the inhabitants of the coast of Coromandel, to go a fishing, and trade along the coast. They are made of three or four small canoes, or of trunks of trees dug hollow, tied together with ropes of cocoa, with a triangular sail in the middle, made of mats. The persons who manage them are almost half in the water, there being only a place in the middle, a little raised, to put in the merchandises, which last particular must be understood only of the trading *Catimarons*. Rafts in imitation of them, and similarly denominated, were tried on the coasts of America during the recent war, in order to carry combustibles among our enemies lying at anchor, but without much success.

CANVAS, (GER. *Segeltruch*. DU. *Zeildoek*. DA. *Segldug*. SW. *Segelduh*. FR. *Toile à voile*. IT. *Cancvazza*, *Lona*. SP. & PORT. *Lona*. RUS. *Parussnoe polotno*, *Parussina*;) a very clean unbleached cloth of hemp or flax, woven very regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals or squares. It is also a coarse cloth of hemp, unbleached, somewhat clean, which serves to cover women's stays, to stiffen men's clothes, &c. &c. It is chiefly used to make sails for shipping, &c.

CAPE, is a promontory, or head-land, running out with a point into the sea.

CAPER, (*Capers*. GER. *Kapern*. DU. *Kappers*. DA. *Kapers*, *Kappers*. SW. *Kapris*, *Capris*. FR. *Capres*. IT. *Cappari*. SP. *Alcaparras*. PORT. *Alcaparras*. RUS. *Kaparszii*. POL. *Kapary*.) *Caparis spinosa*, or common caper, a low shrub, generally growing out of the joints of old walls or fissures of rocks in the warm parts of Europe. This plant is with great difficulty preserved in England. It grows in great perfection in the southern parts of France, and in Italy. The *capers* sold in the shops are the full-grown buds of the flowers gathered before they blow, and spread in the shade till they begin to grow flaccid. Then they are put in a vessel, vinegar added to them, covered with a board, and let to remain for eight days; then being taken out of the vessel, they are squeezed gently; and fresh vinegar added, and let to stand for eight days more. This operation is repeated a third time. This done, the capers are put in a cask with vinegar, to which some add salt.

CAPER-SPURGE, (GER. *Springkürner*. DU. *Springkooren*. DA. & SW. *Springkorn*. FR. *Epurge*, *Catapuce*. IT. *Catapuzza minore*. SP. & PORT. *Tartagos*, *Catapucia menor*;) an extract from the caper-tree, used in pharmacy as a purgative.

CAPHAR, a duty which the Turks raise on the Christians who carry or send merchandise from Aleppo to Jerusalem and other places in Syria.

CAPITAL, among merchants, bankers, and traders, signifies the sum of money which a merchant at first puts into trade. It signifies likewise the fund of a trading company, or corporation, in which sense the word *stock* is generally added to it. Thus we say the *capital stock* of the Bank, &c. The word *capital* is opposed to that of profit or gain, though the profit often increases the *capital*, and becomes itself part of the *capital*, when joined with the former.

CAPLAN, a sort of small fish, which abounds in those places where they fish for cod; there is a great plenty of it on the coast of Placentia, in Newfoundland. It is used to bait the hooks of the lines with which cod is caught.

CAPPADINE, a sort of silk flock, taken from the upper part of the silkworm-cod, after the true silk has been wound off.

CAPS, (GER. *Mützen*. DU. *Mutsen*. DA. *Huer*. SW. *Mössor*. FR. *Bonnets*. IT. *Berrette*. SP. *Gorros*, *Gorras*. PORT. *Barretes*. RUS. *Kolpaki*, *Schapki*. POL. *Czapki*.) coverings for the heads of both men and women. Those of the latter are made of tiffany, muslin, &c. and of the former, of leather, fur, and other articles.

CAPS, in a ship, square pieces of timber put over the heads or upper ends of the masts, having a round hole to receive the mast. By means of these caps, the top-masts and topgallant-masts are kept steady and firm in the tressel-trees where their feet stand.

CAPS, of a gun, are pieces of lead put over the touch-hole to keep the priming from being wasted or spoiled.

CAPSIUM, *Guinea pepper*, is of three sorts, viz.

1. *Capsicum annum*, the common long-podded capsicum.

2. *Capsicum baccacum*, the bird-pepper, grows nearly five feet high; the leaves are of a lucid green. This is the Cayenne-pepper.

3. *Capsicum grossum*, the bell-pepper. The fruit of this is red, and is the only kind proper for pickling, the skin being tender, whereas those of the other sorts are thin and tough.

CAP-SQUARES, in gunnery, strong plates of iron which come over the trunnions of a gun, and keep it in the carriage.

CAPSTAN, **CAPSTERN**, or **MAIN CAPSTAN**, in a ship, a large piece of timber in the nature of a windlass, placed next behind the main-mast, its foot standing in a step on the lower deck, and its head between the upper decks formed into several squares with holes in them. It is used to weigh the anchors, to hoist up or strike

down top-masts, to heave any weighty matter, or to strain any rope that requires a main force.

CAPSTAN Jear is placed between the main-mast and the mizen, and serves to strain any rope, heave upon the jear-rope or upon the viol, or hold off by at the weighing of an anchor.

CAPTURE, particularly relates to prizes taken by privateers, &c. in time of war, which are divided between the captors, &c.

CAPUT MORTUUM, in chemistry, signifies the fæces or residue of any body, remaining after all the volatile and humid parts have been extracted. The term is often used colloquially and otherwise to convey a sarcasm on any thing from which all the goodness has been extracted.

CARABINE, a fire-arm, shorter than a musket, carrying a ball of twenty-four in the pound, borne by the light-horse, hanging by a belt over the left shoulder.

CARACT, **CARAT**, or **CARRAT**, the name of that weight which expresses the degree of fineness that gold is of. The Mint-master, or custom, has fixed the purity of gold at 24 caracts; though it is not possible to purify and refine that metal, but it will want still about 1-fourth part of a caract in absolute purity and perfection. The caract is divided into 1-fourth, 1-eighth, 7-sixteenths, 1-thirty-second. These degrees serve to distinguish the greater or less quantity of alloy therein contained: for instance, gold of 22 caracts is that which has two parts of silver or of any other metal, and 22 of fine gold. It is also a certain weight which goldsmiths and jewellers use, with which to weigh precious stones and pearls. This caract weighs four grains, but is something lighter than the grains of other weights. Each of these grains is subdivided into 1-half, 1-fourth, 1-eighth, 1-sixteenth, &c. See **WEIGHTS AND MEASURES**.

In Spain, the *carat* or *quilate* is also of 4 grains: three *caracts* make a *tomin*, eight *tomins* a *castillan*, six *castillans* and two *tomins* one ounce, and eight ounces a *marc*; but the *marc* of Spain is about 1-seventh lighter than that of France.

CARAGI, thus are called, in the Grand Seignior's dominions, the duties of importation and exportation paid on merchandise. It is also the name of the custom-house officers who receive the duties. The general or chief officer, or director of the custom-house, is called *Caragi Bachi*.

CARAGROUTH, a silver coin of the Turkish empire, weighing about 9 drachms. It goes at Constantinople for 120 aspers. Its value in English currency is 5s.

CARAMANGOE, a drug which comes from China, and is proper to be used in medicine. The Tonquinese value it very much.

CARANNA, is a tenacious, resinous concrete; while fresh, it is ductile like pitch, but hard and friable when it has been kept for any time; outwardly of an ash colour inclining to black; inwardly of an obscure brown. It is brought to us from New Spain and other parts of America in little masses rolled up in leaves of flag. This resin affords by distillation a fine, thin, limpid, and odoriferous oil, which is esteemed, as is the resin itself, a very powerful external remedy in cases of pain, tumours, and wounds of the nerves.

CARAPACE, a thick, solid, and firm shell, which covers the turtle, or tortoise, and to which adhere those fine transparent shells, which are known under the name of tortoise-shells, of which snuff-boxes and several sorts of inlaid works are made.

CARAT. See **CARACT.**

CARAVAN, signifies a company or assembly of travellers, and more particularly of merchants, who for their greater security, and in order to assist each other, travel together through the deserts, and other dangerous places, which are infested with Arabs and robbers. This is the true origin of these associations. In order to form a *caravan*, it is necessary to have the permission in writing of a sovereign Prince. That permission must comprehend the number of men, carriages, and quantity of merchandise of which the *caravan* is to be composed. Those merchants, to whom the *caravan* belongs, appoint its officers, and regulate every thing relating to its police or government during the march. There are five sorts of *caravans*: the *heavy caravans*, composed of elephants, dromedaries, camels, and horses; the *light caravans*, which have but few elephants; the *common caravans*, where there are none of those animals; the *horse caravans*, in which they use neither dromedaries nor camels; and lastly the *sea caravans*, consisting of a number of merchant-ships under the convoy of some men of war; whence it may be observed, that the idea of a *caravan* is not so entirely restrained to the land, but that there may also be *marine caravans*. The proportion observed in the *heavy caravan* is as follows: when there are four hundred elephants, they add one thousand dromedaries, and two thousand horses at least, and the escort is composed of four thousand men on horseback. Two men are required for leading one elephant, five for three dromedaries, and seven for eleven camels.

A great many *caravans* set out for *Erzerum*, the capital of that part of Armenia which is under the dominion of the Grand Seignior. Some of them consist of Armenians only, as those which carry silks to Tocat, and to Constantinople: they commonly set out in September. The *caravans* of Siberia enter into the territories of China,

by Selinginskoy. situated in the fifty-second degree of northern latitude, on the eastern bank of the river Selenga. There are sea-caravans from Constantinople for Alexandria. The *caravan* of Nubia goes twice a year into Egypt. It passes through Gary, a place on the left bank of the Nile, three or four days' journey on this side of Dongola. There the merchants of Sannar, the capital of Fungi, those of Gondar, the capital of Ethiopia, and many others from divers parts of Africa, meet at a certain time, when they know the *caravan* is to arrive. Then setting out from Gary, the *caravan* leaves the banks of the Nile, and crossing the deserts of Libya, arrives, after a march of thirteen days, in a valley, which is thirty leagues long. This valley, which extends almost from north to south, is planted with palm-trees, and very well cultivated, because good water may be found by digging only one foot deep in the ground. After some days rest in this agreeable place, the *caravan* marches a whole day between steep mountains, in an even, but narrow road; after which it arrives at a narrow pass, through which it crosses that chain of mountains running along the Nile on the side of Libya, and comes at last to Manfelout, a town in Upper Egypt, where the duties to the prince are paid in black slaves, and where the *caravan* meets the Nile again, for the first time from its setting out from Gary.

There is likewise at Cairo every year a numerous *caravan* from Tripoli, to which the merchants of Algiers, Tunis and Morocco join themselves, as well as those who go in pilgrimage to Mecca. This *caravan* is much less on its return, because the greatest part of those merchants who went by land, with only money, or very fine merchandise for sale, having employed their effects at Mecca in buying Indian commodities, which are bulky, embark at Alexandria, and return by sea to Algiers.

Every year also *caravans* come into Egypt from Syria, but the time of their arrival and setting out is not fixed. The journey of the *caravans* is not difficult, because the deserts which separate these two countries are crossed in three days, and there is no scarcity of water. On the road several *caravanseras*, in which the travellers and their cattle are furnished gratis with all necessaries, are to be met with; so that these *caravans* enjoy all possible conveniences, especially the rich people among them, who, nevertheless, live very soberly during their journey. The *caravanseras* in the East are something in the nature of our capital inns in Europe, with this difference however, that in the *caravanseras* little accommodation is met with, either for man or beast, all persons being obliged to carry almost every thing with them.

CARAVEL, or **CARVEL**, a kind of light

round ship: hence we term a ship *carvel-built*.

CARAWAY, or **CARAWAY SEED**, (GER. *Kümmel*, *Feldkümmel*, *Brodkümmel*. DU. *Karwey*, *Veldkomyn*. DA. *Kummen*, *Dansk kummen*. SW. *Kummin*, *Brodkumin*. FR. *Carvi*, *Cumin des près*. IT. *Carvi*. SP. *Alcaravea*. PORT. *Alcaravia*, *Chirivia*. RUS. *Dikii timon*. POL. *Karuy*, *Kmin polny*. LAT. *Carvi*.) is a small seed, of an oblong and slender figure, pointed at both ends, and thickest in the middle. It is rounded or gibbous on one side, and flattened on the other, and is deeply striated on the surface; it is considerably heavy; its colour is a deep brown; its surface perfectly free from hairiness, and somewhat bright or glossy. It is of a very penetrating smell, not disagreeable, and of a hot, acrid taste. *Caraway seed* is to be chosen large, new, and of a good colour, not dusty, and of a strong agreeable smell. The principal purpose to which it is applied, is in confectionary.

CARBEQUI, or *asper of copper*, a coin which is current in the province of Georgia, in Asia, particularly at Teflis, the capital of it; 40 *carbequis* make an *abagi*, and 10 *carbequis* a *chasuri*. It is worth about 5s. English.

CARBON. The diamond is supposed to be carbon in a state of absolute purity. It cannot be distinguished in its chemical characters from pure carbon; the products of both from combustion are the same. Carbon combined with a portion of oxygen may be obtained by passing alcohol through a red-hot tube. It is the base of common charcoal, which substance is an oxide of carbon.

Carbon has not been fused, but when an intense heat is applied, it rises in vapour.

Carbon has the property of de-oxidizing the oxides of metals, and other combustible substances, and with this view it is often used in the arts, in the state of charcoal.

Carbon is found in large proportions in bitumens; it is ready-formed also in all vegetables, and in most animal substances; and combined with oxygen, enters into the composition of a great variety of substances of the mineral kingdom. It unites with several of the metals. With iron, in the proportion of one part in two hundred, it constitutes steel; nine parts of carbon to one of iron form plumbago; with a large proportion of oxygen it becomes carbonic acid.

From the indestructible nature of charcoal, the practice of charring piles that are to be driven into the ground, and casks intended to preserve water at sea, has been deduced. It has the property of removing the taint of meat, from its antiseptic quality. Putrid water is rendered tolerably sweet by charcoal; common vinegar being boiled with charcoal, loses its colour; and ardent spirits, as rum, &c. lose their colour and bad taste by maceration with charcoal. The

colouring matter of litmus, indigo, &c. disappear by such treatment.

CARBUNCLE, (GER. *Karfunkel*. DU. *Karfinkel*. DA. Sw. and RUS. *Karbunkel*. FR. *Escarboucle*. IT. *Carbonchio*. PORT. *Carfuncula*. SP. *Carbunculo*. POL. *Karbunkul*. LAT. *Carbunculus*.) a precious stone of the ruby kind, of a very rich, glowing blood-red colour.

CARD, (GER. *Kardüschen*, *Karden*, *Wollkratzen*. DU. *Kaarden*, *Wolkaarden*. DA. *Karder*, *Uldkarder*. SW. *Kerdor*. FR. *Cardes*. IT. *Cardi*. SP. and PORT. *Cardas*. RUS. *Bardü*. POL. *Grepły*.) is an instrument or comb composed of a great number of small pieces or points of iron wire, a little incurvated like hooks towards the middle, and fastened closely together on leather, being nailed by the edges on a flat piece of wood, which is an oblong square, about a foot long, and near half a foot broad, with a handle placed in the middle, on the edge of the longest side: there are always two *cards*, between which are put the materials that are to be worked.

These cards serve to arrange the hairs of wool, flax, hemp, &c.: they are of different kinds, as hand-cards, stock-cards, &c. Cards are prohibited to be exported.

CARDS, or **PLAYING CARDS**, (GER. *Karten*, *Spiel karten*. DU. *Kaarten*, *Speelkarden*. DA. *Kort*, *Spilkort*. SW. *Kort*. FR. *Cartes à jouer*. IT. *Carte da giuoco*. SP. *Cartas*, *Naipes*. PORT. *Cartas de jogar*. RUS. *Kartiü*. POL. *Karty*), little thin pieces of fine pasteboard of an oblong figure, of several sizes, but most commonly in England three inches and a half long, and two inches and a half broad, on which are painted several points and figures. The moulds and blocks for making cards, are exactly like those that were used for the first books: they lay a sheet of wet or moist paper on the block, which is first slightly done over with a sort of ink made with lamp-black diluted in water, and mixed with some starch to give it a body. They afterwards rub it off with a round list. The court-cards are coloured by means of several patterns, stiled *stane-files*. These consist of papers cut through with a penknife, and in the apertures they place severally the various colours, as red, black, &c. The patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the pasteboard, they slightly pass over it a brush full of colour, which, leaving it within the openings, forms the face or figure of the card. We used to export cards to Russia, but they are prohibited by the last tariff.

Cards and dice are prohibited from being imported. Persons not giving notice where cards or dice are made, or removing the same before they are marked, except for exportation, are liable to heavy penalties.

Persons selling second-hand cards incur a penalty of 5*l.* per pack.

No unstamped dice or cards shall be used in any gaming-house or elsewhere, under a penalty of 5*l.* upon the seller.

CARDAMOMS, (*Cardamom*, GER. *Kardamum*. DU. *Kardamomen*. DA. *Cardamomer*. SW. *Kardemummor*. FR. *Cardamomes*. IT. *Cardamomi*. SP. and PORT. *Kardamomos*. RUS. *Kardamon*. POL. *Cardamom*. LAT. *Cardamomum*,) come to us from the East Indies, and are of a dark brown colour, an aromatic smell, and a hot biting taste, and are contained in short triangular pods, of a pale colour. There are two sorts, the *greater* and *less cardamoms*. All kinds of *cardamoms* abound in an essential oil: bruised and macerated in water, and afterwards distilled, they yield a very considerable quantity of it. The people of the East use them in sauces; with us they are much esteemed in medicine; but the lesser kind are the most so. They are to be chosen sound, close shut on all parts, and full of seeds of a good smell, and of an acrid aromatic taste.

CARDING, a method of preparing wool, cotton, hair, &c. by passing it between the iron points, or teeth of two instruments, called *cards*, in order to disentangle and range the fibres, or hairs thereof, and dispose of it for spinning, weaving, &c. See **CARD**.

CARD-WIRE, (GER. *Kratzdraht*. DU. *Kaardendraad*. DA. *Kardetraad*. SW. *Kardtrad*. FR. *Fil à carde*. IT. *Filo da cardì*. SP. *Alambre para cardas*. PORT. *Arame para cardas*,) a wire manufactured of iron, for the teeth, &c. of wool-cards. See **WIRE**.

CAREENING, in the sea language, the bringing a ship to lie down on one side, in order to trim and caulk the other side.

A ship is said to be brought to the careen, when the most of her lading being taken out, she is hauled down on one side by a small vessel as low as may be necessary, and there kept by the weight of the ballast, ordnance, &c. as well as by ropes, lest her masts should be strained too much, in order that her sides and bottom may be trimmed, seams caulked, or any thing that is faulty under water mended. Hence when a ship lies on one side as she sails, she is said to sail on the careen.

CARGADORS, a name which the Dutch have borrowed from the Portuguese, signifying a *ship-broker*.

CARGO, signifies all the merchandise and effects laden on board a ship, exclusive of the crew, rigging, ammunition, provisions, guns, &c. We say a ship has its *cargo*, when it is laden as full of merchandise as it can hold; that it has half its cargo when it is half full, and so on.

CARLINE, **CARLIN**, or **CAROLINE**, a

silver coin current in the Neapolitan dominions, and worth about four-pence of our money.

CARLINGS, or **CARLINES**, in a ship, two pieces of timber lying fore and aft, along from beam to beam, whereon the ledges rest on which the planks of the ship are fastened.

CARLINO, a small silver coin, which is current in the kingdom of Naples, and in Sicily, worth about four-pence sterling.

CARLOCK, a sort of isinglass made with the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine; but it is also used by dyers. See **ISINGLASS**.

CARMELINE, or **CARMENIA WOOL**, (GER. *Karamenirche* oder *Kirmansche Wolle*. DU. *Kirmansche Wol*. FR. *Laine de Carmenie*. IT. *Lana di Caramania*. SP. *Lana de Caramenia*. PORT. *Laa de Caramania*,) is the second sort of wool produced by the animal which the Spaniards call *vicunna*, which is a species of sheep, a native of South America.

CARMEN. The rates and orders for carmen in the city of London, are settled at the general quarter sessions of the peace.

Carmen are to help to load and unload their carts; and if any carman exacts more than the regular rates, upon due proof, before the Lord Mayor, or any two magistrates, he shall suffer imprisonment for the space of 21 days.

If any person shall refuse to pay any carman his hire, according to the regular rates, upon complaint made, the President of Christ's Hospital, or a Justice of the Peace, may compel payment.

Merchants or other persons may choose what cart they please, except such as stand for wharf-work, tackle-work, crane-work, at shops and merchants' houses, which are to be taken in turn; and every carman standing with his empty cart next to any goods to be loaded, shall, upon the first demand, load the same for the accustomed rates; and if any person shall cause a carman to attend at his house, shop, warehouse, or cellar, with his loaded cart, the carman being willing to help to unload the same, he shall pay the carman after the rate of twelve-pence for every hour after the first half-hour for his attendance.

Every licensed carman is to have a piece of brass fixed upon his cart, upon which is to be engraven a certain number, which number, together with the carman's name, is registered in a register kept at Christ's Hospital; so that, in case of any misbehaviour, the party offended, by taking notice of the number of the cart, may search for it in the register, and the name will be found.

Carmen, not conforming to these rules, or working without a numbered piece of brass fixed on the cart, may be suspended from their employment.

Carmen, riding upon the shafts of their carts, or sitting within them, not having some person on foot to guide the horses, shall forfeit 10s.

CARMINE, (GER. RUS. and POL. *Karmín*. DU. *Karmyn*. DA. SW. and SP. *Carmín*. FR. *Carmine*. IT. *Carminio*. PORT. *Carmim*. LAT. *Carminum*.) a powder of a very beautiful red colour, bordering upon purple, and used by painters in miniature. The mode of preparing this colour has been a pretended secret with the French, from whom we mostly obtain the article; but there is no doubt that it is extracted from cochineal by means of water, wherein probably *chouan* and *antour* have been infused; some add *racou*, but this must give it too much of the opal cast. Others make carmine with Brazil-wood, fernambouc, and leaf-gold, beaten in a mortar, and steeped in white-wine vinegar; the scum arising from this mixture, upon boiling, when dried, makes carmine, but of a kind inferior to the former. *Chouan* is a French name for a small seed of yellowish-green colour, resembling worm seed, brought from the Levant. *Autour* or *antour*, is a kind of bark also brought from the Levant, somewhat resembling cinnamon in shape and colour. To be good, carmine must be an impalpable powder.

CARNEL, among ship-carpenters. The building of ships, first with their timbers and beams, and after bringing on their planks, is called carnel-work, to distinguish it from clinch-work.

CARNELIAN, CARNELION, or CORNELIAN, *sarda*, in natural history, a precious stone, of which there are three kinds, distinguished by three colours; red, yellow, and white. Ancient authors have attributed medical virtues to this stone. It is very well known amongst us, and is found in roundish and oval masses, much like our common pebbles. It is generally met with between an inch, and two or three inches, in diameter. It is fine, compact and close in its texture, of a glossy surface, and in several specimens is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds or variegations; but sometimes it is veined very beautifully with an extremely pale red, or with white, the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian which are all of one colour and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish: it is not at all affected by acid menstruums; the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long-continued heat

will reduce it to a pale dirty-grey. The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia, and we have some of an inferior sort in England.

CAROBES, a sort of beans, which grow plentifully in the island of Cyprus; most of the inhabitants live upon them, and large quantities are sent, in small vessels, to all the islands of the Archipelago.

CAROLUS, an ancient English broad piece of gold, struck under Charles I., at the time it was coined, rated at twenty shillings; also, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France. It was worth twelve deniers when it ceased to be current.

CAROTEEL, an uncertain weight or quantity of goods; thus a caroteel of cloves is from four to five hundred weight, of currants from five to nine, of mace about three hundred, of nutmegs from six to seven hundred and a half, weight.

CARPENTER, an artificer whose business is to cut, fashion, and join timber and other wood for building, and for all domestic purposes inferior to cabinet work.

CARPET, (*Carpets*. GER. *Teppiche*. DU. *Tapyten*, *Vloer-tapyten*. DA. *Tapper*, *Tape-ter*. FR. *Tapis*. IT. *Tappeti*. SP. *Alfombras*, *Alcatifas*, *Tapetes*. PORT. *Alcatifas*, *Tapetes*. RUS. *Kowri*, *Kilimi*. POL. *Kobierzek*.) a sort of stuff wrought with the needle, or on a loom, which is part of the furniture of a house; commonly laid upon floors. Persian and Turkey carpets are most esteemed; though at Paris there is a manufactory after the manner of Persian, where they make them little inferior, not to say finer, than the true Persian carpets. There are also carpets of Germany, some of which are made of woollen stuffs, as serges, &c. and called square carpets; others are made of wool also, but wrought with the needle, and often embellished with silk; and lastly there are carpets made of dog's hair. We have carpets made at Axminster, Kidderminster, &c. in England, and at several towns in Scotland and Ireland.

In weaving carpets, the design or pattern is traced in its proper colours on cartons, tied before the workman, who looks at them every moment, because every stitch is marked upon them, as it is to be in his work. By this means he always knows what colours and shades he is to use, and how many stitches of the same colour. In this he is assisted by squares, into which the whole design is divided; each square is subdivided into ten vertical lines, corresponding with the parcels of ten threads of the warp; and besides, each square is ruled with ten horizontal lines, crossing the vertical lines at right angles. The workman, having placed his spindles of thread near him, begins to work on the first horizontal line of one of

the squares. The lines marked on the carton are not traced on the warp, because an iron wire, which is longer than the width of a parcel of ten threads, supplies the place of a cross line. This wire is managed by a crook at one end, at the workman's right hand; towards the other end it is flatted into a sort of knife, with a back and edge, and grows wider to the point. The weaver fixes his iron wire horizontally on the warp, by twisting some turns of a suitable thread of the woof round it, which he passes forward and backward, behind a fore thread of the warp, and then behind the opposite thread, drawing them in their turn by their leashes. Afterwards he brings the woof-thread round the wire, in order to begin again to thrust it into the warp. He continues in this manner to cover the iron rod or wire, and to fill up a line to the tenth thread of the warp. He is at liberty either to stop here, or go on with the same cross line in the next division, according as he passes the thread of the woof round the iron wire, and into the warp, the threads of which he causes to cross one another at every instant: when he comes to the end of the line, he takes care to strike in, or close again all the stitches with an iron reed, the teeth of which freely enter between the empty threads of the warp, and which is heavy enough to strike in the woof he has used. This row of stitches is again closed and levelled, and in the same manner the weaver proceeds: then with his left hand he lays a strong pair of shears along the finished line, cuts off the loose hairs, and thus forms a row of tufts perfectly even, which, together with those before and after it, form the shag. Thus the workman follows, stitch for stitch, and colour for colour, the plan of his pattern, which he is attempting to imitate; and he paints magnificently, without having the least notion of painting or drawing. This description is to be understood as applicable to the superior kinds of carpeting, for the inferior sorts are made by the simplest process of weaving.

CARPO BALSAMUM, the fruit or berry of the tree, which produces the true balm of Gilead. *See* BALSAM.

CARRARA, *marble*, the name of a species of white marble, distinguished from the Parian, because the statuary marble, by being harder and less bright.

CARRIAGE, in its primary signification, is merely a machine for the conveyance of persons, goods, &c. from place to place, and comprises coaches, waggons, carts, &c. for which see those titles.

CARRIAGES for guns, (*GER.* *Lavetten*, *Lafetten*. *DU.* *Affûten*. *DA.* and *Sw.* *Lavetter*. *FR.* *Affûts*. *IT.* *Casse d'artiglieria*. *SP.* *Afustes*. *PORT.* *Carretas de artilheria*. *RUS.* *Lafete*.) the frames on which cannons are mounted.

CARRIDARRIES, a species of prohibited Bengal muslin.

CARRIER. Every person carrying goods for hire is deemed a carrier, and as such is liable in law for any loss or damage that may happen to them whilst in his custody. Waggoners, captains of ships, lightermen, &c. are therefore carriers; but a stage-coachman is not within the custom as a carrier; neither are hackney-coachmen carriers within the custom of the realm, so as to be chargeable for the loss of goods, unless they are expressly paid for that purpose, for their undertaking is only, to carry the person.

A carrier may refuse to receive goods into his warehouse before he is ready to take his journey, because he is not obliged to find warehouse room; he may also refuse to receive goods at unseasonable hours; but he cannot refuse generally, on account of his public employment. *Ld. Raym.* 646.

By stat. 3 Wm. c. 12. the justices in Easter sessions have power to rate the prices of all land-carriage goods to be brought from any place within their jurisdiction, by any common waggon or carrier. And by that statute, and 21 Geo. 2. c. 28., such carriers are punishable by fine of 5l. to be recovered before two justices, by distress, for charging more than the rated price, between such place and London, or between London and such place.

In almost all cases carriers are answerable, either criminally, or civilly, for the safe delivery of goods committed to their care.

If a carrier open a parcel committed to his care, with the intent to steal any part of the contents, he is guilty of felony. 1 *Hawk.* c. 35.

And if a carrier carry goods to the place appointed, and after take them away with intent to steal them, their having been delivered to him originally, does not save his second taking from the charge of felony. *Ibid.*

Also, if he undertake to carry goods to a certain place, and carry them to another, and dispose of them to his own use, it is felony. *Keetings*, 82.

A carrier, pretending to have delivered goods, but to have lost the bailee's receipt, obtained the money for the carriage; was indicted under stat. 30 Geo. 2. c. 24. for obtaining money under false pretences, and convicted, 2 *East. Rep.* 30.

Where goods are delivered to a carrier, and he is robbed of them, he shall be answerable for their value in an action; for a carrier is by law placed in the situation of an insurer, and answerable at all events, except for the acts of God, and the king's enemies. 1 *T. R.* 27.

Therefore he is answerable if the goods be burnt in his possession as a carrier, and in the common course of his business, though by accident. *Ibid*

And he must not only carry them, but deliver them safe and in as good a state as

he received them, or answer the damage in an action. *Bac. Ab.*

And he has that kind of special property in them that he may indict, or bring actions, on account of them, if stolen from him, or damaged by another while in his possession, as the absolute owner might do. *2 Bos. & Pul.* 419.

If the owner of goods travel in a *common carriage*, along with them, but they are entrusted like other goods to the general care of the carrier, the owner's presence does not absolve the carrier from his general responsibility.

But though if a carrier accept *generally*, he is liable to the full value; he may also, as is very common, accept conditionally, to be paid after an extraordinary rate if the goods are above a certain value, and *that* by general advertisement only, without special bargain or personal communication. In this case, the carrier is only a special acceptor, and not liable beyond the amount he adventures.

And if any imposition be practised on him, as paying an *extraordinary* price to induce him to carry goods to the value of 100*l.* when in fact the value of the goods be 1000*l.*; if the carrier be robbed, or by any other means lose such goods, the owner shall not recover any part, not even that for which he agreed, because of the fraud and imposition. *1 H. Black.* 298.

A carrier cannot retain goods for a balance due to him upon a general account, unless by special agreement; but he may retain them till he is paid the carriage for those particular goods. *8 East. R.* 224.

And even if they be stolen goods, the right owner is bound to pay the carrier for the carriage before he is entitled to take them. *Ld. Raym.* 166.

CARRONADE, a short kind of ordnance, capable of carrying a large ball, and useful in close engagements at sea. It has its name from Carron, the place where this kind of ordnance was first made.

CARROTS. See **ROOTS**.

CARTEL, a treaty during time of war, relating to the exchange of prisoners.

CARTERS. This fellowship has the exclusive privilege of acting within the city for hire; they have 420 **carts** belonging to them, and they are regulated by the city of London; they are compellable to do the cartage business of the port when called upon, and are responsible for the safety of their load, and the conduct of their servants. They pay to the governors of Christ's Hospital annually, for their licences 17*s.* 4*d.* and 1*l.* 3*s.* 6*d.* for every transfer.

CARTHAMUS tinctorius, a plant with a saffron-coloured flower, a native of Egypt, and some of the warm parts of Asia. It is cultivated in many parts of Europe, and in the Levant, whence great quantities of it

are annually imported into Great Britain, for dyeing and painting.

CARTRIDGES, (*GER.* *Kardusen*, *Patrenen*. *DU.* *Kardoesen*. *DA.* *Karduser*. *SW.* *Kardusor*. *FR.* *Gargousses*. *IT.* *Cartocci*. *SP.* and *PORT.* *Cartuchos*;) in the military art, a case of paper, pasteboard, or parchment, holding the exact charge of a fire-arm. Those for muskets, carabines, and pistols, hold both the powder and ball for the charge; and those of cannon and mortars are usually in cases of pasteboard or tin, sometimes of wood, half a foot long, adapted to the calibre of the piece.

CARTS. Every cart, &c. for the carriage of any thing to, and from, any place, where the streets are paved, within the bills of mortality, shall contain six inches in the felly; and no person shall drive any cart, &c. within the limits aforesaid, unless the name of the owner, and number of such cart, be placed in some conspicuous part thereof, and his name entered with the commissioners of the hackney-coaches, under the penalty of 40*s.* and any person may seize and detain such cart till the penalty be paid. *18 Geo. 2. c. 33.*

On changing property the name of the new owners shall be affixed, and entry shall be made with the commissioners of the hackney-coaches. The entry of all carts within five miles of Temple-bar, is strictly enjoined by the *24 Geo. 3. s. 2. c. 27.* See *3 Dick. Pract. Epos.* 322.

CAS, CAXA, CAYAS, CACHEE, CASSE, and CASIE, is a small money of lead, and the scum of copper mixed; its principal currency is at Bantam, and the rest of the island of Java, and in some neighbouring islands. Two hundred of these *caxas* are worth nine deniers, or $\frac{2}{3}$ sterling.

CASAVA, GASAVA, or GAZANA, is an East Indian silver coin, and one of the roupes current in Indostone, especially at Amadabath. It is worth 2*s.* 6*d.* English.

CASBEQUE, or KABESQUE, is a small copper coin, only made and current in Persia; it is worth about six deniers tournois, and the *demi casbesque* one half. *Pul* is the common name for all copper in Persia. It is worth 12*s.* 5*d.* English.

CASCARILLA. (*GER.* *Kaskarille*. *DU.* *Kaskarilla*. *DA.* *Caskarille*. *SW.* *Schakarillbark*. *FR.* *Cascarille*, *Chaquerville*. *IT.* *Cascariglia*. *SP.* *Cascarilla*. *PORT.* *Cascarilha*. *RUS.* *Kaskaril*. *POL.* *Kaskarel*, *Szakrel*. *LAT.* *Cascarilla*.) See **BARK**.

CASE, among printers, denotes a sloping frame, divided into several compartments, each containing a number of types or letters of the same kind. From these compartments the compositor takes out each letter as he wants it, to compose a page or form.

CASE of crown-glass, contains 12, 15, or 18 tablos. In cases of the best glass there

are the smallest number of tables, as the price is the same for each case.

CASE of *Newcastle green glass* contains 35 tables.

CASE-HARDENING, a method of rendering the surface of iron so hard as to resist the file or any edged tool. The art of case-hardening is a lesser degree of steel-making, and is performed by baking the iron instruments in a kind of oven stratified with powdered charcoal, hoofs, horns, &c. so as to exclude the air; by which means the instruments acquire a kind of coat of steel some depth below their surface.

CASE-SHOT, in the military art, signifies musket-balls, stones, old iron, &c. put into cases, and shot out of great guns.

CASES, are boxes made for packing up goods chiefly for exportation, &c. and are made of all sizes.

CASH, in commerce, is the stock or ready money which a merchant has in his *caisse* or coffer, for present use; at least such is the derivation given by most of our lexicographers. This, however, to others has appeared a forced application of the name of the repository containing the treasure, to the treasure contained itself; and such persons rather suppose the term to have been brought from India; *cass* being a common name for all sorts of small coin used in traffic in those regions, especially in the islands of the Indian Ocean. (See title *ASIA*, article *CHINA*.) Some have gone so far as to say, that almost all the terms used in money transactions in Europe, were originally brought by the Dutch from their settlements in the island of Sumatra, where they carried on a prodigious traffic; that the medium of their commercial intercourse was *Cass*, or small money, and the place where it was transacted *Banca*, whence *Cash* and *Bank*. Etymology however is scarcely even a secondary consideration in commerce, therefore it is only on this subject necessary to add, that by the modern application of the word, it stands not merely for money, but for all its representatives payable upon demand, as bank notes, bankers' checks, &c. &c.

CASH-ACCOUNT, in mercantile transactions, is that account to which nothing but money is carried on the one hand, and from which the disbursements of the concern are drawn on the other hand. The balance is the *cash in hand*. When the credit side more than balances the debt, or disbursement side, the account is said to be *in cash*; when the contrary, to be *out of cash*.

CASHEW-NUTS, (GER. *Akajunüsse*, *Westindische Anakarden*. DU. *Catsjoenooten*. DA. *Akajunüdder*. SW. *Akajunütter*. FR. *Noix d'acajou*. IT. *Acaju*. SP. *Nueces d'acaju*. PORT. *Nozes d'acaju*.) The tree which yields these nuts grows naturally in the West Indies, and arrives at the height

of 20 feet in those places of which it is a native. The fruit is as large as an orange; and is full of an acid juice, which is frequently made use of in making punch. To the apex of this fruit grows a nut, of the size and shape of a hare's kidney; but it is much larger at the end which is next to the fruit, than at the other. The shell is very hard, and the kernel, which is sweet and pleasant, is covered with a thin film. Between this and the shell is lodged a thick, blackish, inflammable liquor, of such a caustic nature in the fresh nuts, that if the lips chance to touch it, blisters will immediately follow. The kernels are eaten raw, roasted, or pickled. The caustic liquor just mentioned is esteemed an excellent cosmetic with the West India young ladies; but they must certainly suffer a great deal of pain in its application. The milky juice of this tree will stain linen of a good black, which cannot be washed out.

CASHIER, he who keeps the *cash*, or the money, which it is his business to receive and pay. In every depository of money, whether public or private, under the denomination of a *bank*, there must be an officer of this description.

CASK, a common name for vessels of different kinds, in contradistinction to the liquor or other matter it contains: a cask of sugar is a barrel of that commodity, containing from 8 to 10 cwt. A cask of almonds about 3 cwt., and a cask of raisins about 1 cwt. &c.

CASKET, a chest for holding jewels, &c.

CASKETS, on board a ship, small ropes made of sinnet, and fastened to gromets or little rings upon the yards. Their use is to make fast the sail to the yard, when it is to be furled.

CASSADA, or **CASSAVA**, (GER. *Kassave*. DU. *Kassave*, *Maniok*. DA. SW. and IT. *Cassava*. FR. *Cassave*, *Manioc*, *Magnoc*. SP. *Caxabe*, *Magnoc*. PORT. *Mandioca*.) a mealy substance, derived from the root of a plant called *Magnoc*: the root in a crude state is a deadly poison; but when the pernicious part is separated from it, it affords excellent bread. The plant is a native of the West Indies.

CASSIA, (GER. *Kassie*. DU. *Kassie*. DA. and SW. *Cassia*. FR. *Casse solutive*. IT. *Cassia fistola*. SP. *Canafistola*. PORT. *Cassia purgante*. RUS. *Kassee*. POL. *Fistula*. LAT. *Cassia fistula*.) *Cassia fistula*, the purging cassia of Alexandria, is a native of Egypt and both Indies; it rises to the height of 40 or 50 feet, with a large trunk, dividing into many branches, with winged leaves. The flowers are produced in long spikes at the end of the branches, each standing upon a long foot-stalk: these are composed of fine yellow concave petals, which are succeeded by cylindrical pods, from one to two feet long, with a dark brown woody shell, having a longitudinal seam on one side, di-

vided into many cells, by transverse partitions, each containing one or two oval, smooth, compressed seeds, lodged in a blackish pulp, which is the cassia used in medicine. There are two sorts of this drug in the shops, one brought from the East Indies, the other from the West. The canes or pods of the latter are generally larger, rough, thick-rinded, and the pulp nauseous; those of the former are less smooth, the pulp blacker, and of a sweeter taste; this sort is preferred to the other. The pods should be chosen weighty, new, and not rattling (from the seeds being loose within them) when shaken. The pulp should be of a bright shining black colour, and a sweet taste; not harsh, which happens from the fruit being gathered before it has grown fully ripe, or sourish, which it is apt to turn upon keeping; it should neither be very dry, nor very moist, nor at all mouldy; which, from its being kept in damp cellars or moistened, in order to increase its weight, it is very subject to be. The greatest part of the pulp dissolves both in water and rectified spirit, and may be extracted from the pod by either. This pulp is a gentle laxative medicine.

CASSIDONY, a mineral and precious stone, with veins of several colours, of which vases are made, and which were in great esteem among the ancients, called by them *murrhina*.

CASSITERIA, in the history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin. The cassiteria are of two kinds: the whitish pellucid, and the brown: the first is tolerably bright, and seldom subject to the common blemishes of crystal: it is of a perfect and regular form, in the figure of a quadrilateral pyramid, and is found in Devonshire and Cornwall.

CASSUMUNIAR, **CASSUMAR**, or **CASSUMUNAR**, is a tuberous root, which comes from the East Indies. It is about an inch thick, and cut into transverse sections, marked on the surface with circles like galangal, of a dusky-yellow colour within, a bitter, hot, aromatic taste, and fragrant smell, somewhat resembling ginger. It is a cardiac and sudorific, and is a very famous medicine in nervous cases.

CASTILLAN, or **CASTILLANE**, a gold coin, current in Spain, and worth fourteen rials, and sixteen deniers, or 2s. 11d. British. The *castillan* is used in Spain, as also in South America, as a weight for weighing gold. It is the hundredth part of a pound Spanish weight. What they commonly call a weight of gold in Spain, &c. is always understood of the *castillan*, fifty castillans make a mark, and eight tominas a castillan. Every tomin is equal to twelve grains British.

CASTLE, in the sea language, is a part

of the ship, of which there two; the fore-castle, being the elevation at the prow, or the uppermost deck, towards the mizen, the place where the kitchens are; and the hind-castle, where the officers' cabins are.

CASTOR, or **CASTOREUM**, (*Fiber*, and *canis ponticus*; *castor fiber*, Linn. Syst. Nat.) the *Beaver*. In the inguinal region of this animal are found four bags, a large and a small one on each side: in the two large ones, there is contained a softish, greyish-yellow, or light brown substance, which, on exposure to the air, becomes dry and brittle, and of a brown colour. This is the *castor* which is used in medicine. The two smaller bags have a smell much like that of the larger, but contain a softer and more unctuous matter, of little value.

The best sort of castor comes from Russia, and is in hard round bags; an inferior sort from Dantzic. The worst is from New England, which is in thin long bags.

On cutting open these bags, when dry, they are found full of a brittle friable substance, of a brownish-red colour, interspersed with fine membranes and fibres, intimately interwoven. It is sometimes adulterated with dried blood, gum-ammoniacum, and galbanum, mixed with a little of the powder of castor, and some quantity of the fat of the beaver. To detect the fraud we may observe, that in the genuine, the follicles and membranes all arise from one source, and the substance contained in them is firm; the smell will also distinguish them. When the membranes, pellicles, and fibres, do not appear mixed with the castor, the sophistication is undoubted.

It is of considerable use in medicine.

CASTOR-NUTS, (GER. *Purgiernüsse*. DU. *Gemeene Purgatie nooten*. DA. *Purgiernüdder*. SW. *Jonä kurbits frö*. FR. *Graines de ricin*. IT. *Manteche*. SR. *Catapucia mayor*, *Chervas*. PORT. *Carrapatos*. LAT. *Semina Ricini*, s. *Catapuciae majoris*.) are the nuts of the *palma Christi*, from which the oil is extracted. See **CASTOR-OIL**.

CASTOR-OIL, an oil extracted from the seeds or nuts of the *ricinus communis*, or *palma Christi*. The oil is extracted by expression, or by gentle boiling in water. It is commonly thick and viscid, of a light amber colour, and with little smell or taste. That which has least smell, taste, and colour, is the mildest and best. If it has become acrimonious by keeping, shaking it in a bottle with a little warm water, and then pouring it off, will improve it. It usually comes to us from the West Indies.

CATECHU, or **ARECA**, an Indian nut. The chief use that is made of it by the Indians is to chew it with the leaves of *betle*. The Dutch East India Company sent a great deal of it in their ships into the kingdom of Bengal. There grows, or is pre-

pared in Malabar, a sort of red *Areca*, or *Catechu*, which is used in dyeing. It is also sent to Surat and Amadabat, for the use of the dyers in the northern parts of Hindoostan.

CAT-HARPINGS, in a ship, small ropes running in little blocks, from one side of the shrouds to another, near the deck. Their use is to force the shrouds, and make them taut, for the greater security and safety of the masts.

CAT, or **CAT-HEAD**, on ship board, a short piece of timber in a ship, lying aloft right over the lawse, having at one end two shivers, wherein is reeved a rope, with a great iron hook fastened to it, called

CAT-HOOK. Its use is to trice up the anchor, from the hawse to the top of the forecable.

CAT-HOLES, in a ship, are over the parts as right with the capstan as they can be: their use is to heave the ship astern, upon occasion, by a cable, or hawse, called stern-fast.

CAT-GUT, or **CATLING**, (GER. *Darmsaiten*. DU. *Darmspaaren*. DA. *Tarmstränge*. SW. *Tarmsträngar*. FR. *Cordes de boyau*. IT. *Corde di budella*. SP. *Cuerdas de tripas*. PORT. *Cordas de tripas*.) a small string for fiddles and other musical instruments, made from the intestines of sheep and lambs, dried and twisted either singly or several together. They are sometimes coloured, and are used by watchmakers, cutlers, turners, and other artificers, in the manner of a file. Great quantities are imported into England from France and Italy.

CATGUT, (GER. *Marly*. DU. *Marlie*. DA. and SW. *Marli*. FR. *Marly*. IT. *Rezza*. SP. and PORT. *Marli*, *Merli*.) a kind of open-worked stuff, composed of cotton, flaxen, or silken threads, and stiffened with starch or glue; used by females.

CAT-SALT, a name given by our salt-workers, to a very beautifully granulated kind of common salt. It is formed out of the bitter or leach-brine, which runs from the salt when taken out of the pan. When the common salt is taken from the boiling-pans, it is put into long wooden troughs, with holes bored at the bottom, for the brine to drain out: under these troughs vessels are placed to receive this brine, and across them small sticks, to which the cat-salt fixes itself in large and beautiful crystals. It contains some portion of the bitter purg- ing salt, is sharp and pungent, and is white when powdered, though pellucid in the mass. Large quantities of this salt are used in the manufacture of hard soap.

CATERGI, are the name of the carriers in the Grand Seigneur's dominions, who give earnest to the merchants, &c. as a security, that they will carry their goods, or not set out without them.

CATI, or **CATTI**, is a Chinese weight, in

use on the side of Canton. It is divided into 16 tales, each tale making one ounce, two gros of France; so that the *cati* is one pound four ounces mark; a hundred *catis* make a pic, which is a large Chinese weight, like the hundred and twenty pounds of Paris, Amsterdam, Strasburgh, &c. The *cati* is also the only weight at Japan; it is likewise used at Batavia, and other parts of India, where it is lighter or heavier, according to the number of tales it consists of; for example, at Java it is only worth 20 tales, but at Cambaya they are worth 27.

CAT'S EYE, a name given by jewellers to the *asteria* of the ancients, a gem which more than any other approaches to the nature of the opal, but wants much of its beauty. It is naturally of a semicircular figure, or smaller segment of a sphere, and flat at the bottom. It is smooth and glossy, and of a pale brown colour, in which it has an included white, which plays about in it, as held differently to the light, in the manner of the fire-colour of the opal, and seems, like that, bedded deep in the stone. It is sometimes tinged with a greenish, blueish, or yellowish colour. It is met with in the island of Borneo, and in some other parts of the East Indies; also in New Spain, and in some parts of Europe, where it is found bedded in the same stone with the opals. It is said to have some virtues as an astringent.

CATSUP, **CATCHUP**, or **KETCHUP**, a kind of nice pickle, made from the juice of mushrooms, champignons, or walnuts, with salt and spices.

CATTLE, is a collective name, importing all quadrupeds used either in tilling the ground, or for the food of man. The choice, breeding, and management of cattle, makes an important branch of husbandry; and in that point of view, the different kinds of them are treated more at large under their respective divisions into species.

What relates to them *generally* is as follows:

By 3 & 4 Edw. 6. c. 19. no person shall buy any ox, steer, runt, or cow, &c. and sell the same again alive, in the same market or fair, on pain of forfeiting double the value thereof, half to the king, and half to him that shall sue; and this act is still in force, notwithstanding the general repeal of the statutes on this subject by 12 Geo. 3. c. 71.

If any person shall feloniously drive away, or steal, or wilfully kill, any ox, bull, cow, calf, steer, bullock, heifer, sheep, or lamb, with a felonious intent to steal the carcase, or any part thereof, or shall assist in committing any such offence, he shall be guilty of felony without benefit of clergy. 14 & 15 Geo. 2. c. 6.

Any person who shall unlawfully and maliciously kill, maim, or wound any cattle, shall be guilty of felony without benefit of

clergy; and the hundred shall be liable for the damages, not exceeding 200*l.*; and persons prosecuting offenders to conviction shall have 10*l.* reward.

To prevent the stealing of horses, &c. for the sake of their skins, several statutes have been successively passed, by which regulations are adopted for the licensing of slaughter-houses, and the appointment of inspectors, as well as respecting the times and manner of slaughtering cattle, and flaying and cutting of hides. These are, 26 Geo. 3. c. 71., the 39 & 40 Geo. 3. c. 66., the 41 Geo. 3. c. 55., and the 56 Geo. 3. c. 110.

CAUDEBEC, a sort of hats, manufactured at *Caudebec*, in Normandy; they are made of lambs' wool, the hair or down of ostriches, or of camels' hair.

CAUKING, CAULKING, or CALKING, is to drive oakum, or spun-yarn, or something of that kind, into the seams of the planks of a ship, to keep the water out. This is performed with a mixture of tallow, pitch, and tar, as low as the ship draws water; they drive the oakum in with an iron instrument, called a calking-iron; it is made like a chisel.

CAVALLO, a small brass coin of Italy, worth only the twenty-fourth part of a penny.

CAVAN, a measure used in some of the Philippine Islands, and especially at Manila, for measuring rice, corn, pulse, &c. containing 50 lbs. Spanish weight. See **WEIGHTS AND MEASURES**.

CAVEAR, CAVEER, or CAVIAR, the spawn or hard roes of sturgeon, made into small cakes, an inch thick, and of a hand's breadth, salted and dried in the sun. This sort of food is in great repute throughout Muscovy, because of their three Lents, which the Muscovites keep with great strictness.

CAVEAT, is a caution entered in the spiritual court, to stop probates, administrations, dispensations, faculties, institutions, and such-like, from being granted without the knowledge of the party that enters it. A caveat stands in force for three months. 2 *Rol. Rep.* 6.

CAVEDO, a Portuguese long measure, equal to $27\frac{3}{10}$ English inches.

CAXA, a little coin made of lead, mixed with some scoria of copper, struck in China, but current chiefly at Bantam, in the island of Java, and some of the neighbouring islands. The caxas are of two kinds, great and small. Of the small, 300,000 are equal to 56 livres, 5 sols, French money: and of the great, 6000 are equal to four shillings and sixpence sterling.

CAYAN, CAYENNE PEPPER, or GUINEA PEPPER, (GER. *Spanischer Pfeffer*. DU. *Spanische peper*. DA. *Spansk peber*. SW. *Spanskpeppar*. FR. *Piment, Piment de Guinée*. IT. *Peperone*. SP. *Pimiento, Pimienta*

ae Indias. PORT. *Pimentao, Pimenta de Guiné ou da ilha Hespanhola*. RUS. *Strutschkowi perez*. LAT. *Capsicum, piper indicum*.) red pepper, which comes to us from the West Indies, of a very hot and high-flavoured taste, much used in made dishes. It is called the West India bird-pepper, and is a species of the *capsicum annum*. This pepper derives its name from the island of Cayenne, in South America, of which it is a native.

CAYELAC, a sweet-scented wood, which grows in the kingdom of Siam.

CEDAR, (GER. *Zeder*. DU. *Ceder*. DA. *Cedertræ*. SW. *Cederträ*. FR. *Cedre*. IT. SP. and PORT. *Cedro*. RUS. *Kedr*. POL. *Cedr*. LAT. *Cedrus*.) The cedar of Mount Lebanon, mentioned in the Scripture, is reckoned one of the finest and largest trees in the world. Its wood is very hard, beautiful, solid, inclining to a brown colour, and incorruptible. During the hottest season of the year, there runs naturally from the trunk and large branches, a white, clear, and transparent resin, called *cedar gum*.

The timber of this tree is very dry, and subject to split; nor does it endure to be fastened with nails; therefore pins of the same wood are much preferable. Many of the West India Islands, especially Jamaica, are well stored with cedars. In North America, cedars are likewise very plentiful. A small cedar-tree grows in Phœnicia and Cilicia; it is pretty much like the Juniper-tree. Italy, Spain, and Provence, have their cedars too.

CEDRIA, or CEDRAT, of this, there is only one species, called Barbadoes bastard cedar. It produces a kind of fruit called *Citron*, which also bears the name of the tree.

CELDRA, a certain measure among the Scotch, a *chalder*: whence our *chaldron* of the Scotch and Newcastle coal.

CEMENT, (GER. *Zement*. DU. DA. & SW. *Cement*. FR. *Cément*. IT. *Cemento*. SP. *Betun, Zulague*. PORT. *Cemento, Cimcinto*. RUS. *Siment*. LAT. *Cementum*.) any glutinous substance capable of uniting and keeping things together by cohesion.

Some of the best cements for various common purposes are as follow:

Turkey Cement, for joining metals, glass, &c. — Dissolve mastich in as much spirit of wine as will suffice to render it liquid; in another vessel dissolve as much isinglass (which has been previously soaked in water till it is swollen and soft) in brandy, as will make two ounces by measure of strong glue, and add two small bits of gum galbanum, or ammoniacum, which must be rubbed or ground till they are dissolved; then mix the whole with a sufficient heat; keep it in a phial stopp'd, and when it is to be used set it in hot water.

A Cement for broken china.—Take quicklime and white of eggs, or old thick varnish; grind and temper them well together, and the cement is ready for use.

A Cement for wood.—Take resin one pound, pitch four ounces; melt these together, and while boiling hot, add brick-dust, until by dropping a little upon a stone, you perceive it hard enough; then pour it into water, and immediately make it up in rolls, and it is fit for use. By applying it to the side of a chuck, and making it warm before the fire, you may fasten any thin piece of wood, which will hold while you turn it; when you want it off again, strike it on the top with your tool, and it will drop off immediately.

Cement for electrical purposes.—Melt one pound of resin in a pot or pan, over a slow fire; add thereto as much plaister of Paris, in fine powder, as will make it hard enough; add a spoonful of linseed-oil, stirring it all the while, till sufficiently tough for the purpose; if it be not sufficiently hard, add more plaister of Paris; and if not tough enough, a little more linseed-oil. This is a good cement for the necks of globes or cylinders, or any thing that requires to be strongly fixed; for it is not easily melted again when cold.

Cement for broken glass.—Broken glass may be soldered or cemented in such a manner as to be as strong as ever, by interposing between the parts glass ground up like a pigment, but of easier fusion than the pieces to be joined, and then exposing them to such a heat as will fuse the cementing ingredient, and make the pieces agglutinate without being themselves fused. A glass for the purpose of cementing broken pieces of flint glass, may be made by fusing some of the same kind of glass previously reduced to powder, along with a little red lead and borax, or with the borax only: or where exquisite nicety of appearance does not prohibit the application of it, isinglass dissolved in brandy, or other strong spirit, over a fire, will answer the purpose.

Cement for Derbyshire spar and other stones.—Seven or eight parts of resin, and one of bees' wax, melted together with a small quantity of plaister of Paris. If it is wished to make the cement fill up the place of any small chips that may have been lost, the quantity of plaister must be increased a little. When the ingredients are well mixed, and the whole is nearly cold, the mass should be well kneaded together. The pieces of spar that are to be joined must be heated, until they will melt the cement, and then pressed together, some of the cement being previously interposed.

Cement for stone.—Boiled linseed-oil, litharge, and red and white lead, mixed together to a proper consistence, and applied on each side of a piece of flannel previously

shaped to fit the joint, and then interposed between the pieces before they are brought home (as workmen term it) to their place, and a proper adjustment is obtained. When this is expected the white lead ought to predominate in the mixture, as it dries much slower than the red. When the fittings will not admit easily of so thick a substance as flannel being interposed, linen may be substituted, or even thin pasteboard paper. This cement answers well for joining stones, however large. Cisterns built of square stones, put together with this cement, will never leak, or want any repairs.

In this case the stone need not be entirely bedded in it; an inch, or even less, of the edges that are to lie next the water, need only be so treated; the rest of the joint may be fitted with good lime.

Cement for iron.—Take two ounces of sal ammoniac, one ounce of flour of sulphur, and sixteen ounces of cast-iron filings or borings. Mix all well together by rubbing them in a mortar, and keeping the powder dry. When the cement is wanted for use, take one part of the above powder, and twenty parts of clean iron borings or filings, and blend them intimately by grinding them in a mortar. Wet the compound with water, and when brought to a convenient consistence, apply it to the joints with a wooden or blunt spatula. By a play of affinities, which those who are at all acquainted with chemistry will be at no loss to comprehend, a degree of action and re-action takes place among the ingredients, and between them and the iron surfaces, which at last causes the whole to unite as one mass. In fact, after a time, the mixture and the surfaces of the flanches become a species of pyrites (holding a very large portion of iron), all the parts of which cohere strongly together.

Blood Cement.—A cement often used by copper-smiths to lay over the rivets and edges of the sheets of copper in large boilers, to serve as an additional security to the joinings, and to secure cocks, &c. from leaking, is made by mixing powdered quicklime with ox's blood. It must be applied fresh made, as it soon gets hard.

Japanese Cement, or rice-glue.—This elegant cement is made by mixing rice-flour intimately with cold water, and then gently boiling it. It is beautifully white, and dries almost transparent. Papers pasted together by means of this cement will sooner separate in their own substance than at the joining.

CENSAL, a broker, so called in Provence, in France, and in the ports of the Levant. Censals negotiate bills of exchange for the merchants; they also purchase and dispose of merchandise for a commission or brokerage. Their commission or brokerage is usually $\frac{1}{2}$ per cent. or 10s. in the 100l.

CENT, an abridgment of centum, is

used to express the profit or loss arising from the sale of any commodity; thus we say, there is 10 *per cent.* profit, or 10 *per cent.* loss; which is 1-tenth profit, or 1-tenth loss, upon the sale of the whole. In the trade of money, it signifies the benefit or interest of any sum of money. Thus money is worth 4 or 5 *per cent.* upon exchange. But in brokerage it must be observed, that *cent.* is applied in a different manner. For example, if a broker or exchange-agent takes 1-eighth *per cent.* for the contracts made by his interposition, it is to be understood that there is paid to him 1-eighth of a pound, viz. 2s. 6d. for every 100*l.* he negotiated.

CERIUM. This metal was first discovered in the year 1804, by Hisinger and Berzelius, in a peculiar mineral found at Ridderytta in Westmannland, in Sweden. It is of a reddish colour, brittle, and possesses a considerable degree of brilliancy. Its scarcity has prevented its qualities and combinations being much known.

CERTIFICATE of Bankrupts. See **BANKRUPT.**

CERTIFICATES for foreign goods exported. To export goods by *certificate*, which must be foreign goods formerly imported, and on which a part of the customs paid on importation is drawn back, provided they are exported within the time limited by act of parliament, it is not sufficient only to mention the marks, numbers, and contents, as is commonly practised in the entries outwards, but also the name of the ship, &c. in which the goods were imported, the importer's name, and time of entry inwards; and make oath that the entries for these goods were paid, or secured to be paid, as the law directs: after you have made an entry in this manner, you are to carry it to the collector and comptroller, or their deputies, who, after examining their books, will grant a warrant, which must be given to the surveyor, searcher, and land-waiter, for them to certify the quantity of goods; after which the *certificate* must be brought back to the collector and comptroller, or their deputies, and oath made that the said goods are really shipped, and are not to be landed again in any part of Great Britain, &c. This done they set down in words at length, on the back of the debenture, and then in figures on the same side, the sum in each particular part of the duties, and subscribe jointly to the whole. By virtue of this debenture, the exporter may, in one month, after the ship's departure from Great Britain to any foreign port, demand his drawback, except to Ireland, from whence a *certificate* must be obtained, "that the goods so exported hence, have been landed there, and the duty paid or secured," and upon the producing such *certificate*, the exporter will be entitled to recover the drawback. And if the collector has not money in his hands to

pay the debenture, he is to certify the same on the back of the debenture, that the exporter may have recourse to the commissioners, who are then to pay him.

CERTIORARI. A *certiorari* is an original writ issuing out of the Chancery, or court of King's Bench, directed in the king's name to the judges or officers of inferior courts, commanding them to return the records of a cause or matter depending before them, to the end the party may have the more sure and speedy justice before him, or such other justices as he shall assign to determine the cause. 4 *Black. Com.* 272.

CERUSE, or CERUSS, (*GER. Bleyweiss. DU. Loodwit. DA. Blychvidt. SW. Blyhvitt. FR. Ceruse. IT. Biacca. SP. Albayade. PORT. Albaide. RUS. Bjelilu, Bleywas. LAT. Cerusa*.) white-lead, a sort of calx of lead made by exposing the plates of that metal to the vapour of vinegar.

The Venetian *ceruse* is esteemed the best of all, but it is very dear; the Dutch is next in quality; and the English the worst. The two latter sorts are made of white-lead and white chalk; and the chalk of England being less white, and the English mixing more of it with the *ceruse* than the Dutch do, is the reason of their different degrees of goodness. To judge of its quality it must be chosen very white, both within and without, fine, clean, soft, and friable. That is the worst kind which breaks the easiest, as wanting the due texture and adhesion. The *ceruse* is used externally, either mixed in ointments or by sprinkling it on old gleeing and watery ulcers, and disorders of the skin. *Ceruse* is much used by oil-painters; it affords an excellent white.

CHA, a thin, light silken stuff, made in China, and worn by the inhabitants for a summer dress.

CHAFFERS, in our old records, signify wares or merchandise; and hence the word chaffering is used for buying and selling.

CHAIN, a series of links of metal fastened one within another, and applied to various purposes. Gold, silver, and brass chains are chiefly used for ornament, iron ones for bearing weights for commercial, agricultural, naval, and domestic purposes.

CHAIN, a kind of measure in France, used in the trade of wood for fuel: there are chains of wood by tale, for wood by the rope, for faggots, for cleft wood, and for round sticks: there are also chains measuring the sheaves of all sorts of corn, &c.

CHAIN, in surveying, a measure of length, composed of a certain number of links made of iron wire, serving to take the distance between two or more places. Gunter's chain contains 100 such links, each measuring $7\frac{9}{16}$ inches, consequently equal to 66 feet, or 4 poles.

CHAIN, watch, (*Chains. GER. Ketten.*

Du. Kettingen. **DA. Keder, Kieder.** **Sw. Kedjor.** **FR. Chaines, Chainettes.** **IT. Calene.** **SP. Cadenas.** **PORT. Cadeas.** **RUS. Zepü.)** Watch-chains are made of gold: of silver for sea-faring men, as not liable to rust; or steel, &c.; and large quantities of gilt brass and copper ones are manufactured at Birmingham, &c.

CHAIN-PUMP. See **PUMP.**

CHAINS in a ship, those irons by which the shrouds by the masts are made fast to the chain-walls, which are the broad timbers jetting out of the sides, to which the shrouds are fastened and spread out, the better to secure the masts.

CHAIN-SHOT, two bullets with a chain between them. They are used at sea to shoot down yards or masts, and to cut the shrouds or rigging of a ship.

CHAIR, (*Chairs.* **GER. Stühle.** **DU. Stoelen.** **DA. Stoele.** **SW. Stolar.** **FR. Sièges.** **IT. Sedie.** **SP. Sillas.** **PORT. Cadeiras.** **RUS. Stuli.** **POL. Stalki.**) a moveable seat. The frames are generally composed of wood of various kinds, and the seats of horse-hair, rushes, cane, &c.

CHAIR, sedan, a kind of portable coach, made of leather, holding only one person, borne on two poles by two men: supposed to derive its name from Sedan, in France, where it is said they were first used.

CHALCANTUM. See **VITRIOL.**

CHALDRON, a dry English measure, consisting of thirty-six bushels heaped up according to the sealed bushel kept at Guildhall, London: but on shipboard, twenty-one chaldron of coals are allowed to the score. The chaldron should weigh two thousand pounds weight.

CHALK, (*GER. Kreide.* **DU. Krypt.** **DA. Kride, Kridt.** **SW. Krita.** **FR. Craie.** **IT. Creta.** **SP. Greda.** **PORT. Greda, Cré.** **RUS. Mjel.** **POL. Kreta.** **LAT. Creta**.) the English name of the white, dry, calcareous earth, with a dusty surface, found in hard masses, and called by authors *creta*, and *terra creta*, being originally brought from the island of Crete.

Chalk is of two sorts, the first dry and hard, the other soft and unctuous. This latter it is which is now much used by way of a manure, and on some sorts of land it is useful, but is not permanent in its effects. Laid on grass it is said to make the cow pastures particularly sweet and productive of milk. It raises an effervescence with acids, and therefore with chemical agriculturists, who consider this as the stimulant to vegetation, even the hardest chalk, and the most caustic lime, are highly esteemed, when placed in commixture with decaying vegetables, because so applied they are observed to produce this desideratum.

CHALLENGE, is a word of various application, but always involving the primary meaning, which is that of calling upon, or summoning another. Thus, the

common colloquial term challenge, is a summons to another to combat. In this, sense it is a breach of the peace, and punishable according to the law of England by fine and imprisonment.

In law it imports an exception to jurors who are returned to pass their verdict on a trial. The legal causes for these last-mentioned descriptions of challenge are various. 5 *Black. Com.* 364.

CHAMBER of COMMERCE, is an assembly of merchants and traders, where the affairs relating to trade are treated of. There are several establishments of this sort in most of the chief cities of France; and in our own country, we have lately seen chambers of this kind erected for various purposes.

Chamber of Assurance in France, denotes a society of merchants and others for carrying on the business of insuring; but in Holland, it signifies a court of justice, where causes relating to insurances are tried.

CHAMBERS of the king. The havens or ports of the kingdom are so called in our records.—V. *Mare Clausum*, fol. 242.

CHAMPAIGN, the finest and most esteemed of French wines. This wine is of two sorts, red and white, and is chiefly made in the environs of Ay, Cumieres, and Haut-Villiers, &c. See **WINE.**

CHANDLER'S WARES, (*GER. Fettwaaren.* **DU. Vetewaar.** **DA. Fedevarer.** **SW. Fetvaror.** **FR. Graisses.** **IT. Grasse da' spizzicagnoli**.) include butter, cheese, vinegar, mustard, brick-dust, small-coal, tea, sugar, small-beer, &c.

CHANGER, an officer belonging to the king's mint, mentioned in the statute of Hen. VI. c. 12., whose business was to exchange coin for bullion, brought in by merchants, or others.

CHARACTER. Giving a false one to a servant, see *title* **MASTER.**

CHARAG, a tribute paid to the Grand Seigneur by Christians and Jews, who either live or trade in the Turkish territories.

CHARCOAL, *vegetable*, a sort of artificial coal, consisting of wood half-burnt: which, by reason of the humidity of the wood being mostly dissipated, and exhaled in the fire, wherein it is prepared, makes a strong, clear fire without smoke. See **CARBON.**

CHARCOAL, *animal*, or **COAL of BONES**, so denominated by analogy. It is a mixture of phosphate of lime, a small quantity of quick-lime, and coal, or calx of carbon. Formerly, ivory and other animal bones were burnt in close vessels, in order merely to obtain a fine species of black, known by the name of *ivory black*, for painting, and similar purposes. (See *title* **BLACK**.) But of late it has been found that the charcoal of bones is one of the most efficient purifiers and clarifiers, and the preparation of it, as well for its pristine

purpose, as for the sugar and other refineries, is become a manufacture of increasing interest and consideration.

The modes of performing the operation somewhat differ in different manufactories, but they all tend ultimately to the same purpose. One, and the simplest, method, is to fill a number of earthen, or iron, pots with broken bones, and lute on the cover with potters' earth, then to pile one over the other in a potter's kiln, which is to be heated with wood or coal. When the degree of heat becomes sufficient to decompose the gelatine and oil of the bones, the luting cracks in small fissures, and gives vent to the carbonized hydrogen gas, which taking fire, burns, in consequence of several apertures, made on purpose, one above the other, to admit the atmospheric air. When this flame ceases, the combustion is completed. Another method is to put the bones into cylinders of cast iron, which run through a great fire-place; or in iron alembics: but in these manufactories, the bone black is only reckoned of secondary importance; for this process is generally used for making carbonate, sulphate, and muriate of antimony.

It has been ascertained by experiment that the bones of old animals contain much more gelatine than those of young ones, and therefore the quantity of black charcoal yielded by them is in proportion. The clarifying quality of animal charcoal depends upon the due proportions of the different matters which enter into the composition of bones; wherefore, for example, if the bones used be deficient in gelatine, the manufacturer adds, in the furnace, some soft animal matter, as blood, or tripe. From what has been advanced, it is to be inferred that, whether animal charcoal be intended for painting, or clarifying, that is best which contains the greatest proportion of carbon; and all chemists know that this is easily discovered by the application of muriatic acid to the coal, which, by dissolving the calcareous salts and the lime, leaves the pure coal.

CHARKS. Wood when *charred* is properly charcoal; the pit-coal, when so *charred* or *charked*, in Worcestershire is called *chars*, as the sea-coal so prepared about Newcastle is called *coke*.

CHARRE of lead consists of thirty pigs, each pig containing six stone, of 12lb to each stone.

CHART, (GER. *Seekarten*. DU. *Zee-karten*. DA. *Søekarter*. SW. *Sjökartor*. FR. *Cartes marines*. IT. *Carte marine*. SR. and PORT. *Cartas de marear*), is properly applied to a projection of some part of the sea, as the term *Map* is to a portion of the land. Wherefore charts are sometimes denominated "Hydrographical Maps." They are distinguished into several kinds, as plain,

globular, and Mercator charts. See title MAPS.

CHARTER, is a deed whereby the king passes any grant to one person or more, or to any body politic.

CHARTER-PARTY, (LAT. *Charta partita*. FR. *Chartre parti*, i. e. a deed or writing divided,) is what among merchants and sea-faring men we commonly call a pair of indentures, containing the covenants and agreements made between them, touching their merchandize and maritime affairs. 2 *Inst.* 673. And charter-parties of affreightment settle agreements, as to the cargo of ships, and bind the master to deliver the goods in good condition at the place of discharge, according to agreement; and the master sometimes obliges himself, ship, tackle, and furniture, for performance.

The common law construes charter-parties, as near as may be, according to the intention of them, and not according to the literal sense of traders, or those that merchandize by sea, but they must be regularly pleaded. In covenant by charter-party, that the ship should return to the river of Thames, by a certain time, dangers of the sea excepted, and after in the voyage, and within the time of the return, the ship was taken upon the sea by pirates, so that the master could not return at the time mentioned in the agreement; it was adjudged that this impediment was within the exception of the charter-party, which extends as well to any danger upon the sea by pirates and men of war, as dangers of the sea by shipwreck, tempest, &c. *Stile* 132. 2 *Roll. Abr.* 248.

A ship is freighted at so much per month that she shall be out, covenanted to be paid after her arrival at the port of London; the ship is cast away coming out from the Downs, but the lading is all preserved, the freight shall in this case be paid; for the money becomes due monthly by the contract, and the place mentioned is only to ascertain where the money is to be paid, and the ship is intitled to wages, like a mariner that serves by the month, who if he dies in the voyage, his executors are to be answered *pro rata*. *Molloy de Jur. Maritim.* 260. If a part-owner of a ship refuse to join with the other owners in setting out of the ship, he shall not be intitled to his share of the freight; but by the course of the Admiralty, the other owners ought to give security if the ship perish in the voyage, to make good to the owner standing out his share of the ship. Sir Lionel Jenkins, in a case of this nature, certified, that by the law marine and course of the Admiralty, the plaintiff was to have no share of the freight; and that it was so in all places, for otherwise there would be no navigation. *Lex Mercat.* 100.

A ship was let to freight by charter-party from a plaintiff to the defendant, and there

was a clause in the deed thus : " And it is covenanted and agreed between the parties, that 40 days shall be allowed for unloading and loading again." This was held to be a covenant from the freighter not to detain the ship for the purposes specified *longer than* the 40 days. *Randal v. Lynch*. 12 E. R. 179.

The owners of a vessel performed the legal stipulations of a charter-party, but in so doing provoked confiscation by the illegal and piratical act of a foreign state ; it was held that they did not thereby avoid their assurance. *Sowel v. Assur. Co.* 4 Taunt. R. 856.

Charter-party provided that "*in case of the inability of the ship to execute, or proceed on the service, certain persons should be at liberty to make such abatement out of the freight as they should think reasonable.*" It was held that the inability of the ship to proceed to sea, *only from the want of men to navigate her, because the original crew were disabled from illness, and no substitutes could be procured*, was still within the proviso of the agreement. *Beatson v. Schank*. 5 E. R. 235.

Covenant in a charter-party of affreightment to pay freight and demurrage to the owner for the hire of a vessel, bill of sale during the voyage of the ship by the owner, who became bankrupt. Question was, whether the vendee of the ship under the bill of sale becomes entitled to the freight and demurrage due from the freighter upon the charter-party, or the assignees of the bankruptcy ; held that the assignees were entitled. 10 E. R. 279.

By the common form of the East India Company's charter-parties, the company are warranted in sending any chartered ship on a war expedition in aid of government, and under command of a king's officer placed on board. Such ship remains under the charter-party, though she do so go on a war expedition under command of a king's officer, and though alterations be made to increase her number of guns, &c. &c. *Dobree v. East India Company*. 13 E. R. 290.

CHASE, in maritime affairs, is to pursue a ship in order to come up with her.

CHASE-GUNS, are those which are placed in the head and stern of the ship : the former are useful in chasing another vessel, and the latter when chased or pursued.

CHASER, an artist who raises figures on the cases of watches, tweezers, the lids of snuff-boxes, &c. His art does not consist in casting, but in chasing or embossing. This is performed by having the figures to be chased cut deep in a piece of steel, and a thin plate of silver or gold being made of a proper form, and laid upon a piece of lead, the piece of steel on which is the impression is fastened to the end of a spindle, and is

pressed with great violence upon the metal, when the lead giving way, and the gold or silver being pressed into all the interstices of the mould, swells into every hollow, and takes the impression of every figure.

CHATTELS, or CATALS, all sorts of goods and property, moveable or immovable, except freehold property.

CHAYE, SCHAI, or CHAY, is the smallest silver coin that is made, or current in Persia. It is worth four sols, seven deniers, and one maille of France, or fourpence sterling.

CHEATS, are deceitful practices in defrauding or endeavouring to defraud another of his known right by means of some artful device, contrary to the plain rules of common honesty ; as by playing with false dice, or by causing an illiterate person to execute a deed to his prejudice, by reading it over to him in words different from those in which it was written. By 30 Geo. 2. c. 24. persons convicted of obtaining money or goods by false pretences, or of sending threatening letters in order to extort money or goods, may be punished by fine and imprisonment, or by pillory, whipping, or transportation. But it has been determined on this statute that a false assertion or affirmation, without an artful device or contrivance, will not amount to a false pretence ; and therefore it was held in the *K. v. Lara*, that it was not a false pretence within this statute to purchase goods and to give a bill for them drawn upon a banker with whom the drawer had no effects. 6 T. R. 565.

But this statute not having been found sufficiently comprehensive, 52 Geo. 3. c. 64. enacts, that all persons who knowingly and designedly, by false pretences, obtain from any person, or body politic, any money, goods, wares, or merchandizes, or any bond, bill of exchange, bank note, promissory note, or other security for the payment of money, or warrant or order for the payment of money, or for the delivery or transfer of goods, or other valuable things, with intent to defraud, &c., or shall send any letter threatening to accuse any person with any crime punishable with death, transportation, pillory, or other infamous punishment, with a view to extort any bond, bill, bank note, promissory note, or other security, &c., or any warrant or order, &c., for payment of money or delivery or transfer of goods or valuable things, shall be liable to punishment in like manner as if they had obtained money, &c.

CHECKS, or drafts, on bankers, are instruments by means of which a creditor may assign to a third person, not originally party to the contract, the legal as well as equitable interest in a debt raised by it, so as to vest in such an assignee a right of action against the original debtor. 1 H. B. 602.

These instruments are uniformly made payable to bearer, which constitutes a cha-

racteristic difference between them and bills of exchange; and the legislature has considered them in a more favourable point of view by exempting them from the stamp-duties, under certain restrictions. They are equally negotiable with bills, although, strictly speaking, not due before payment is demanded. When given in payment they are considered as cash; and it is said, may be declared upon as a bill of exchange; and the moment this resemblance begins, they are governed by the same principles of law as bills of exchange. Checks payable on demand, or where no time of payment is expressed, are payable on presentment without any indulgence, or days of grace; but the presentment should be made within a reasonable time after the receipt, otherwise the party upon whom the check is drawn, will not be responsible, and the person from whom the holder received it will be discharged. Therefore, where circumstances will allow of it, it is advisable for the holder of a check to present it for payment on the same day it is received.

CHEDA, a pewter coin made and current in the kingdom of that name in the East Indies. There are two sorts of this coin: the one of an octagon, and the other of a round figure. The first weighs one ounce and a half, and passes in the country for the value of two sols tournois, or 1*d*. English. The second *cheda*, worth four deniers, has eighty cowries, or Maldivian shells, given for it.

CHEEK, is a general name among mechanicks for almost all parts of machines, instruments, &c., which are double, or have two places exactly similar. Thus we have cheeks of a printing-press, cheeks of a lathe, cheeks of a mortar in gunnery, cheeks of a mast in ship-building, &c. &c.

CHEESE, (GER. *Käse*. DU. *Kaas*. DA. and Sw. *Ost*. FR. *Fromage*. IT. *Formaggio*, *Cacio*. SP. *Queso*. PORT. *Queijo*. RUS. *Sur*. POL. *Ser*. LAT. *Caseus*.) the curd of milk separated from the whey, and hardened by a slow heat. The principal manufactures of cheese in England are in the counties of Chester, Gloucester, Wilts, and Leicester. Cheeses from these counties are an article of export to all parts of the world, but liable to high duties in some countries, as for instance in Russia by the last tariff. By stat. 4 W. & M. c. 7. the supply of cheese for the London market is provided for and regulated under penalties to be summarily levied before justices of the peace.

Holland is the great rival of Great Britain in the cheese trade, but though the Dutch cheeses are good, they are generally inferior to ours. The Italians make a cheese which they call Parmesan, from its being first produced in the duchy of Parma; and the Swiss a cheese called Gruyere. They are both excellent, but considered rather as luxuries,

than as a staple commodity for extensive traffic.

Sage cheese is made by introducing the bruised tops of young red sage into the milk with the rennet. There is also a sort of butter made without the process of churning, but merely by draining off the serum or whey, which is called *Cream Cheese*. This is eaten fresh, and is considered a great luxury.

CHEMISTRY, or CHYMISTRY, is that branch of science, the object of which is to ascertain the simple substances or elements of bodies, the properties of these, and their action on each other. The methods made use of to obtain this knowledge are analysis and synthesis. Chemistry comprehends almost all the changes in natural objects, with which we are more immediately connected, and in which we have the greatest interest; it is subservient to the various arts of life, and the several branches of manufacture which are carried on in every civilized state. Dyeing, bleaching, tanning, glass-making, the working and composition of metals, &c. are all processes in chemistry. In agriculture, chemistry investigates the nature of soils; it explains the phenomena of the growth and nourishment of vegetables, and the nature and action of manures. As a science it is connected with all the phenomena of nature, the causes of rain, snow, hail, dew, wind, and earthquakes: it has been called in to the aid of culinary arts; and its high importance in medicine has been long acknowledged. Chemistry therefore is highly worthy of our attention, because beyond every other branch of study it increases our knowledge, extends the number of our resources, and is thus calculated to promote our enjoyments, and augment our power over the material world.

CHERAFIS, or *tela*, are golden medals stamped in Persia, erroneously supposed by some to be current coin, but the Persians make none of gold; so that all the money passing in that empire of this metal is foreign, and not coined there.

CHERAY, or *CHAHY*, a Persian weight used in commerce; it is called the *cidil* or common weight, and is double that named the legal weight.

CHERIF, a small gold coin made current in Egypt, worth about four shillings sterling.

CHERRY-TREE, (LAT. *Cerasus*.) so called from a city in Pontus, from which the tree was imported to Rome in the year of the city 680. It is said to have been introduced here about A. D. 55. Since then several species have been found in other parts of the world, and most of them are now common in this kingdom. The fruit is too well known to be dwelt upon, but the use of the wood seems to be less general

than it deserves to be. The French make cabinet-work of it in great variety, but with us, it is only applied to trifling articles of turnery ware.

CHERT, among miners, denotes a kind of flinty stone, found in thin strata in quarries of lime-stone. It is called by Mr. Kirwan, horn-stone, and by him is said to consist of 72 parts of silica.

22 ——— alumine.

6 ——— carbonate of lime.

100

CHESNUTS, (GER. *Kastanien*. DU. *Kastanien*, *Karstengen*. DA. and Sw. *Kastanier*. FR. *Chataignes*. IT. *Castagne*. SP. *Castanas*. PORT. *Castanhas*. RUS. *Kaschtanü*. POL. *Kusztany*. LAT. *Castanea*.) the fruit of the chesnut-tree, which in France is used as a substitute for potatoes, and oftentimes for bread. Horse-chesnuts are the fruit of the wild chesnut-tree. Starch of very excellent quality has been lately made from horse-chesnuts by a very simple process, similar to that used in transmuting potatoes into starch. See **STARCH**. The wood of the chesnut-tree is the most durable of any that is grown here, next to oak, for buildings. Many of our old churches and colleges are roofed with it.

CHILLA-WEED. See **ORCHILLA**.

CHIMNEY SWEEPERS. By 28 Geo. 3. c. 48. the churchwardens and overseers of parishes, with the consent of two justices, may bind any boy of the age of eight years or more, chargeable to the parish, or who begs, or with the consent of the parent, to be apprentice to a chimney-sweeper, until 16 years of age.

His age to be mentioned in the indenture, as taken from the register, or where none, according to information. *Ibid*.

The form of the indenture is given, but they are not chargeable with the duty now chargeable on parish indentures. *Ibid*.

Covenants for keeping boys under eight years are void; and taking them otherwise, is 10*l*. penalty, and not less than 5*l*. *Ibid*.

Overseers of the poor of any township or village may act. *Ibid*.

Any justice may determine complaints between masters and apprentices. *Ibid*.

No one shall keep more than six apprentices at one time, on like pain; and every master is to affix a brass plate, with his name and place of abode, on the front of a leathern cap for the boy to wear when upon duty, on like pain. *Ibid*.

Masters ill treating apprentices, or being guilty of a breach of covenant, subjected to like pain. *Ibid*.

Masters are not to let apprentices to hire, nor cause them to call the streets before seven, nor after twelve between Michaelmas and Lady-day; nor before five and twelve,

between Lady-day and Michaelmas, on like pain. *Ibid*.

A magistrate may convict; and the penalties are recoverable by distress; but not to issue till six days after conviction, and order for payment served; appeal lies to the informer. *Ibid*.

CHINA-ORANGES. See **ORANGE**.

CHINA-ROOT. (GER. *Chinawurzel*. DU. *Chinawortel*. DA. *Chinarod*. Sw. *Chinarot*. FR. *Squine*, *Esquine*. IT. *Radice China*. SP. *Raiz China*, *Coccolmea*. PORT. *Esquina*, *Eschinezra*, *Raiz da China*. RUS. *Koren tschaputinskü*. POL. *Chyna Korzen*.) There are two kinds of this root in the shops, one brought from the East Indies, and the other from the West. The oriental, which is the only sort here intended, is a thick jointed root, of the reed kind, heavy, woody, and full of unequal knots. Its bark is of a brown colour, of a reddish cast; the inside of the root is white, with a reddish tinge. It has very little taste or smell. That which is fresh, close, solid, heavy, and which, upon being chewed, appears to be full of a fat unctuous juice, is to chosen for medicinal purposes.

CHINA-WARE. (GER. *Porzellan*. DU. *Porcelain*. DA. *Porcelin*, *Porcelaine*. Sw. *Porcellan*, *Porcellin*. FR. *Porcelaine*. IT. *Porcellana*. SP. *Loxa ó barro de la China* *Porcelana*. PORT. *Louça da India ou do Japao*, *Porcelana*. RUS. *Farfur*. POL. *Porcelana*, *Farfura*.) See **PORCELAIN**.

CHINTS, or **CHINTZ**, (GER. *Züze*. DU. *Süts*. DA. *Züts*, *Züts-Kattun*. Sw. *Zütskattun*. FR. *Indiennes*. IT. *Indiane*. SP. *Chites*, *Zaraza*. PORT. *Chitas*. RUS. *Siz*.) fine printed callico, first manufactured in the East Indies, but imitated in other countries. The most beautiful are imported from the coast of Coromandel.

CHIP-HATS, (GER. *Spahnhiuto*. DU. *Spaanhooeden*. DA. *Spaanhutte*. Sw. *Spänhattar*. FR. *Chapeaux de copeaux*. IT. *Cappelli di truciolo e di stelo*. SP. *Sombreros de viruta*. PORT. *Chapeos de cavacos*.) are principally imported from Leghorn and different parts of Italy, where they are manufactured in the greatest perfection; a coarse sort is manufactured in England for home consumption, but it is not equal to the Italian.

CHISEL, (GER. *Meissel*, *Betels*. DU. *Beitels*. DA. *Huggejern*. Sw. *Huggjärn*. FR. *Ciseaux*. IT. *Tenogge*. SP. *Escoplos*. PORT. *Escopros*. RUS. *Dolota*. POL. *Dlota*.) is an iron or steel instrument, sometimes made with, and sometimes without, a wooden handle, used by carpenters and masons to pare wood and stone. Chisels are manufactured at Birmingham, Wolverhampton, Sheffield, &c.

CHISSELS are the coarsest part of flour or meal, after the finer parts are separated from it by the process of dressing or sifting.

They are in fact a mixture of the coarsest part of the flour and the finest of the bran, and are used for many domestic purposes; principally for feeding poultry and pigs, and are not unfrequently given to horses mixed with chopped hay and straw.

CHLORINE. This name is given to what was formerly supposed to be oxy-muriatic gas, or a combination of oxygen gas with muriatic acid gas. Oxygen, however, cannot be detected in it, and it is, in the present state of our knowledge, to be considered a simple substance. It may be obtained by heating a mixture of black oxide of manganese and muriatic acid over a lamp, in a glass retort; it is soon copiously evolved, and may be collected over warm water, (it is rapidly absorbed by cold water,) in a pneumatic apparatus.

Chlorine is an elastic gaseous fluid of a pungent and disagreeable smell, and highly injurious when respired, even when largely diluted. 101 cubic inches weigh 75.375 grains, at the temperature of 60°. Water absorbs twice its bulk of chlorine gas. This solution is of a yellowish-green colour, and has an astringent, nauseous taste. Many substances burn in chlorine gas with much brilliancy, and phosphorus, and several of the metals, take fire spontaneously in it. The combinations of it with some of the metals are acid; others are somewhat similar to the combinations of the same substances with oxygen; those combinations are termed Chlorides.

Chlorine united with oxygen in different proportions forms two different substances, an oxide, and an acid. The oxide, called Euchlorine by Sir H. Davy, may be obtained by stirring together sulphuric acid and oxy-muriate of potash, with a platinum knife; and putting the mixture into a retort, exposed to a temperature of 150°. Euchlorine passes, and may be collected, over mercury. The smell of this substance somewhat resembles that of chlorine. Its taste is astringent, but not acid.

The acid cannot be obtained in a separate state, it must be combined with water, or some other base.

Chlorine is employed in the arts for bleaching, and whitening paper; but it is very improper for the latter purpose, as manuscripts on such paper must, in no great length of time, become completely obliterated.

CHOCOLATE, (GER. *Schokolade*. DU. *Chocolade*. DA. *Skokolade*. SW. *Schokolad*. FR. *Chocolat*. IT. *Ciocolata*. SP. and PORT. *Chocolate*. RUS. *Schokolad*. POL. *Szokolata*. LAT. *Succulata*.) a kind of paste, or cake, prepared chiefly from the cacao-nut. When the cacao is properly roasted, and well cleaned, it is pounded in a mortar, to reduce it to a coarse mass, which is afterwards ground on a stone, till it is of the necessary

fineness: the paste being sufficiently ground, it is put hot into tin moulds, in which it congeals in a very little time. The form of these moulds is arbitrary; the cylindrical ones hold two or three pounds. The larger the cakes are, the longer they will keep. These cakes must be carefully wrapt up in paper, and kept in a day place. The Spaniards mix with the cacao-nuts too great a quantity of cloves and cinnamon, besides other drugs, as musk, ambergris, &c. The grocers of Paris use few or none of these ingredients; they only choose the best nuts, which are called *Caracca*, from the place whence they are brought; and with these they mix a very small quantity of cinnamon, the freshest vanilla, and the finest sugar, but very seldom any cloves. In England, the chocolate is made of the simple cacao, excepting that sometimes sugar, and sometimes vanilla, is added. Chocolate, fresh from the mill, as it cools in the tin pans into which it is received, becomes strongly electrical, and it retains this property some time after it has been turned out of the pans. Chocolate ready made, and cacao-paste, are prohibited to be imported from any part beyond the seas. If made and sold in Great Britain, it pays an inland duty of 1s. 6d. per pound weight; it must be enclosed in papers containing one pound each, and produced at the excise-office to be stamped. Upon three days' notice given to the officer of excise, private families may make chocolate for their own use, provided no less than half a hundred weight of nuts be made at one time.

CHOENIX, a dry measure, containing the forty-eighth part of a medimnus, or six bushels.

CHOWTARS, a species of Bengal calicoes.

CHRISTMAS. Any observation on this as a great religious festival would be misplaced here; but as one of the divisions of the year, called "*quarter days*," and also as the season when commercial men in general close the accounts of the preceding year, strike balances, and present demands, it is entitled to some notice.

The short interval between the day on which this feast is celebrated, (25th December,) and the 1st day of the succeeding January, to use a technical phrase among lawyers, as applied to the days when no business is done at the offices attached to their profession, is a sort of continued "*dies non*;" for then it is, in general, that all their accounts are gone through, and all their books of the preceding year concluded; in order to accomplish which, by a sort of general consent, very little business out of their own counting-houses is transacted.

CHRONOMETER, in general, denotes any instrument, or machine, used in measuring time. Several machines have been

invented for measuring time, under the name of chronometers, upon principles very different from those on which clocks and watches are constructed. The lamp chronometer consists of a chamber-lamp, which is a cylindrical vessel about three inches high, and one inch diameter, placed in a stand. The inside of this vessel must be every where exactly of the same diameter. To the stand is fixed a handle, which supports a frame about twelve inches high, and four wide. This frame is to be covered with oiled paper, and divided into twelve equal parts by horizontal lines; at the end of which are written the numbers for the hours, from 1 to 12, and between the horizontal lines are diagonals, that are divided into halves, quarters, &c. On the handle, and close to the glass, is fixed a style or gnomon. Now, as the distance of the style from the flame of the lamp is only half an inch, if the distance of the frame from the style is only six inches, then, while the float that contains the light descends by the decrease of the oil one inch, the shadow of the style on the frame will ascend twelve inches, that is, its whole length, and show by its progression the regular increase of the hours with their several divisions. It is absolutely necessary, however, that the oil used in this lamp should be always of the same sort, and quite pure, and that the wick also be constantly of the same size and substance; as it is on these circumstances, and the uniform figure of the vessel, that the regular progress of the shadow depends.

CHRYSOCOLLA, a substance much used by the ancients, particularly in soldering gold; it is found in the form of powder, or of a green sand in the copper mines.

CHRYSLITE, a gem which the ancients knew under the name of the topaz; and the true chrysolite of the ancients, which had its name from its fine gold-yellow colour, is now universally called topaz by modern jewellers.

CHURCH, is a temple or building consecrated to the honour of God and religion, and anciently dedicated to some saint, whose name it assumed; or it is an "assembly of persons united by the profession of the same Christian faith, met together for religious worship;" and if it hath administration of the sacraments and sepulture, it is in law adjudged a church.

Not only the freehold of the whole church, but of the church-yard, are in the parson or rector; and the parson may have an action of trespass against any one that shall commit any trespass in the church or church-yard; as in the breaking of seats annexed to the church, or the windows, taking away the leads, or any of the materials of the church, cutting the trees in the church-yard, &c. *Co. Lit.* 644, 645.

Also a man may be indicted for digging up the graves of persons buried, and taking

away their burial dresses, &c. the property whereof remains in the party who was the owner when used; and it is said an offender was found guilty of felony in this case, but had his clergy. *Co. Lit.* 113.

The property of the bells, books, and other ornaments, and the goods of the church, is in the parishioners; but the custody of them is in the churchwardens, who may maintain action of trespass against such as shall wrongfully take them away. *1 Rol. Rep.* 255.

The use of the body of the church, and the seats fixed to the freehold, is common to all the parishioners that pay to the repairs thereof. The chancel of the church is to be repaired by the parson, unless there be a custom to the contrary.

By *1 Eliz. c. 2*; *23 Eliz. c. 1*; and *5 Jac. 1. c. 4*. every person is to repair to his parish church every Sunday, on pain of forfeiting 1s. for every offence; and being present at any form of prayer used contrary to the Book of Common Prayer, is punished with six months' imprisonment, &c. Persons above sixteen years of age, who absent themselves from church above a month, are to forfeit 20*l.* per month to the king, and if they keep any inmate thus irreligiously disposed, in their houses, they forfeit 10*l.* per month. But protestant dissenters are exempted from the penalties by *1 W. & M. c. 18*. And Roman catholics by *31 Geo. 3. c. 52*.

No ill language is to be used, or noise made in churches or church-yards; and persons striking others there are to be excommunicated, and lose one of their ears: and a man may not lawfully return blows in his own defence in these cases. *5 & 6 Edw. 6. c. 4*. Disturbing dissenting or Roman catholic ministers performing divine service, incurs three months' imprisonment, and a forfeiture of 20*l.* by stat. *1 M. c. 3*. and *1 W. & M. c. 18*., *31 G. 3. c. 52*., any person may be indicted for indecent or irreverent behaviour in the church.

CHURCHWARDENS, are ancient officers, chosen yearly in Easter week, by the minister and parishioners of every parish, to look to and take care of the church and church-yard, and the things belonging to the same.

They are to be chosen by the joint consent of the parishioners and minister; and by custom the minister may choose one, and the parishioners another; or by custom the parishioners alone may elect both, though it be against the canon. *1 Vent.* 267.

Exemptions. — All peers of the realm, by reason of their dignity, are exempt from the office of churchwarden. *Gibs.* 215. So are all clergymen, by reason of their order. *Id.* In like manner, all parliament men, by reason of their privilege. *Ibid.*

If an attorney be made a churchwarden of a parish, he shall have a writ of privilege,

showing his privilege to be discharged thereof, by reason of his attendance in court. *Ibid.*

Apothecaries who have served seven years, by 6 W. 3. c. 4.

Freemen of corporation of surgeons in London, by 18 Geo. 2. c. 15.

Visitors of incorporated workhouses, by 22 Geo. 3. c. 85.

Persons not inhabitants. *Gibs.* 215.

Dissenting teachers. 1 W. 3. c. 18.

Catholic ministers. 31 Geo. 3. c. 32.

Persons having prosecuted a felon to conviction. 10 & 11 W. 3. c. 23.

Serjeants, corporals, and drummers, in the militia, and privates, during service. 26 Geo. 3. c. 107.

CIDER, or CYDER, (*GER. Zider, Apfelwein. DU. Cider, Appeldrank. DA. & SW. Cider. FR. Cidre. IT. Cidro. SP. Sidra. PORT. Cidra. RUS. Sidor,*) an excellent drink extracted from the juice of apples, as perry is from that of pears. The manufacturing of these liquors forms an interesting portion of agricultural labour in those counties which are particularly devoted to this beverage. It is also an article of extensive commerce. The first process is to collect the fruit into heaps, where it undergoes a degree of fermentation that brings it to maturity. The common test of the ripeness of the fruit is that of the flesh having acquired such a degree of mellowness, and its texture such a degree of tenderness, as to yield to moderate pressure; thus, when the knuckle, or the end of the thumb, can, with moderate exertion, be forced into the pulp of the fruit, it is deemed in a fit state for grinding in a mill; the only preparation for which is to keep the ripe and unripe separate from each other; but this cannot be done without a considerable degree of labour, for as, by numberless accidents, the ripe and unripe fruit are frequently confounded together, there cannot be any effectual method of separating them but by the hand; and this is one of the grand secrets of cyder-making, peculiar to those who excel in the business. The mill itself differs little from a common tanner's mill for grinding bark, but for the greater convenience of putting the fruit into the mill, every mill should have a fruit chamber over it, with a trap-door to lower the fruit down to the mill. The best manner in which this can be accomplished is to have the valve over the bed of the mill, and furnished with a hose or tunnel reaching down to the trough in which the stone moves; no straw is used in the lofts, but sometimes the fruit is turned. In Herefordshire it is generally believed that grinding the rinds and seeds of the fruit, as well as the fleshy part, to a pulp, is necessary towards the perfection of the cyder, whence it is proper that every kind of pains should be taken to perform the grinding in the most perfect manner. A mill

with smooth rollers will not lay hold of the fruit sufficiently to force it through. Another thing requisite in the cyder mills, is to prevent the matter in the trough from rising before the stone in the last stage of grinding. To effect this, it is best to grind the fruit first in the mill to a certain degree, and then put it between two smooth rollers to finish the operation perfectly. It is an error to grind too much at once, as this clogs the mill, and prevents it from going easily. The usual quantity for a middle-sized mill is a bag, containing four bushels; The quantity put in at one time is to be taken out when ground. The usual quantity of fruit ground in a day is as much as will make three hogsheads of perry, or two of cyder. Some allow the ground fruit to lie 24 hours or more after grinding, and even regrind it, in order to have, in the most perfect manner, the flavour and virtues of the seeds and rinds.

Pressing the fruit, and management of the residuum.— This is done by folding up the ground fruit in pieces of hair cloth, and piling them up above one another in a square frame or mould, which squeezes out the juice, and forms the matter into thin and almost dry cakes. The first runnings come off foul and muddy, but the last, especially in perry, will be as clear and fine as if filtered through paper. It is common to throw away the residuum as useless; but it is found that even breaking the cakes of the refuse with the hands, gives the press fresh power over them; for though they have been apparently pressed to the last drop, a gallon or two of liquor additional may be got in this manner: regrinding them has still a greater effect; as in this state of the materials, the mill gains a degree of power over the more rigid parts of the fruits, which, in the first grinding, it could not reach. The reduced fruit ought to remain some time between the grinding and pressing, that the liquor may form an extract with the rinds and kernels; but this must not be pushed too far, as in that case the colour of the cyder would be hurt; and the most judicious managers object to the pulp remaining more than twelve hours without pressure; thence, upon the whole, the most eligible management in this stage of the process appears to be this: grind one press full a day; press and regrind the residuum in the evening; infuse the reduced matter all night among part of the first runnings, and in the morning re-press while the next pressful is grinding.

A press upon an improved construction is advertised by one Baker, of Fore Street, Cripplegate.

Fermentation.— The common practice is to have the liquor tunned, i. e. put into casks or hogsheads, immediately from the press, and fill them quite full; but it is undoubt-

edly more proper to leave some space empty to be filled up afterwards. No accurate experiment has been made with regard to the temperature of the air proper to be kept up in the place where the fermentation goes on. Frost is prejudicial; but when the process usually commences, that is about the middle of October, the liquor is put into airy sheds, where the warmth is scarcely greater than the open atmosphere. In a complete manufactory of fruit liquor, the fermenting-room should be under the same roof with the mill-house, a continuation of the press-room, or at least opening into it with windows or doors on every side, to give a free admission of air into it, with sufficient defence against frost; fruit-lofts over it, and vaults underneath, for laying up the liquors after fermentation, with small holes in the crown of the arch to admit a hose or pipe for the purpose of conveying the liquors occasionally from the one to the other. In making of fruit liquors no ferment is used as in making of beer, though it seems far from being unnecessary. Owing to this omission, the time of the fermentation is entirely uncertain. But liquor which has been agitated by carriage, though but just taken from the press, will pass almost immediately into a state of fermentation. The continuance of the fermentation is as uncertain as its commencement. Liquors, when much agitated, will go through it perhaps in one day; but when allowed to remain and rest, the fermentation commonly goes on two or three days, and sometimes five or six. The fermenting liquor, however, puts on a different appearance according to circumstances: when produced from fruits properly matured, it generally throws up a thick scum resembling that of malt liquor, and of a thickness proportioned to the species and ripeness of the fruit; the riper the fruit, the greater will be the scum. Perry gives but little scum, and cyder will sometimes do the same. After having remained some time in the fermenting vessel, the liquor is racked or drawn off from the lees, and put into fresh casks. The ordinary time for racking perry is before it has done hissing, or sometimes when it begins to emit fixed air in plenty. The only intention of the operation is to free the liquor from its feculencies, by a cork placed at a little distance from the bottom, after which the remainder is to be filtered through a canvas or flannel bag; this filtered liquor differs from the rest in having a higher colour, having no longer any tendency to ferment; but, on the contrary, checking the fermentation of that which is racked off, and if it loses its brightness, it is no longer easily recovered. A fresh fermentation usually commences after racking; and if it become violent, a fresh racking is necessary in order to check it, in consequence of which

the same liquor will be racked off five or six times: but if only a small degree of fermentation takes place which is called fretting, it is allowed to remain in the same cask, though even here the degree of fermentation which requires racking is by no means determined. The best manufacturers, however, repeat the rackings until the liquor be quiet or nearly so; or if it be found impracticable to accomplish this by the ordinary method of fermentation, recourse must be had to fumigation with sulphur, which is called stumming the casks. For this fumigation it is necessary to have matches made of thick linen cloth, about ten inches long, and an inch broad, thickly coated with brimstone for about eight inches of their length. The cask is then properly seasoned, and every vent except the bung-hole tightly stopped; a match kindled is lowered down into the cask and held by the end undipped until it is well lighted, and the bung driven in, thus suspending the lighted match within the cask. Having burnt as long as the contained air will supply the fire, the match dies, the bung is raised, the remnant of the match is drawn out, and the cask suffered to remain before the liquor is put into it for two or three hours more or less, according to the degree of power the sulphur ought to have. The liquor retains a smell of the sulphureous acid; but this goes off in a short time, and no bad effect is observed to follow. In some places the liquor is left to ferment in open casks, in which it stands till the first fermentation has subsided; after which the froth or yeast collected upon the surface is taken off, it being supposed that it is this yeast mixing with the clear liquor which causes it to fret after racking. The fermentation having totally ceased, and the lees subsided, the liquor is racked off into a fresh cask, and the lees filtered as above directed.

Cyder is made of three kinds, viz. rough, sweet, and of a middle richness. The first is usually destined for common use, and made with little attention or care. The rougher it is the farther it will go. The method of producing this austere liquor is to grind the fruit in a crude under-ripe state, and let the liquor completely ferment. For the sweet liquor, make choice of the sweeter fruits, mature them fully, and check the fermentation of the liquor. To produce liquors of a middle richness, the fruits are to be chosen from amongst such as yield strong and rich juices; though much depends on a proper management. Open vats are preferable to close vessels; but if casks are used at all, they ought to be very large and not filled, nor ought they to lie upon their sides, but to be set on their ends, with their heads out, and to be filled only to such a height as will produce the requisite degree of fermentation; but in whatever way the liquor is put

to ferment, the operation ought to be allowed to go on freely for the first time, though after being racked off any second fermentation ought to be prevented as much as possible.

It would be almost unnecessary to observe, (if it were not on account of a practical inference to which it leads,) that, independently of the *mode of manufacturing*, the flavour of this liquor must depend materially on the *kind* of apple, as well as the state of maturity in which the fruit is used. Apples have recently become an article of extensive import from France, Belgium, America, and Russia. Of those from the two first-mentioned countries, which partake in flavour of the mildness of their original Asiatic climate, (being, as we are informed, natives of Palestine, and introduced into Italy, as a delicacy in the Augustan age,) little cyder is likely to be made, as neither the quantity nor quality of the juice produced seems so well adapted to the purpose, as that from the fruit of colder climates. The apple-trees of this country, in all probability, were introduced from countries of milder temperature, as France and Italy, and are conjectured to have degenerated of late years from an increased coldness in the atmosphere of this island. The more than ordinary produce of this particular year, the warmest which has occurred during a long period, seems to confirm the hypothesis; and if that be admitted, it follows that our stock of apple-trees ought in prudence to be replenished by grafts or cyons from Russia. Experiment, so far as it has proceeded, appears to confirm this suggestion, for it is well known that the few apple-trees which have been introduced into this country from Russia, thrive beyond all parallel with other trees of the same description, and produce a fruit which promises to excel for the strong and rough species of cyder.

Correcting, provincially called Doctoring.—The imperfections which art attempts to supply in these liquors are, want of strength, want of richness, want of flavour, want of colour and brightness. The want of strength is supplied by brandy, or any other spirit, in sufficient quantity to prevent the acetous fermentation. The want of richness is supplied by what are generally termed sweets. To supply the want of flavour an infusion of hops is sometimes added, which is said to communicate an agreeable bitter, and at the same time a fragrance. The want of colour is supplied generally by burnt sugar, which gives the desired colour; the sugar is prepared either by burning it on a salamander and suffering it to drop as it melts, or by boiling it over the fire (in which case brown sugar is to be used) until it acquires an agreeable bitter; then pouring in boiling water in the proportion of a gallon to two pounds of sugar, and stirring it until the

liquor becomes uniform; a pint of this preparation will colour a hogshead of cyder. Brightness is obtained by a mixture of the blood of bullocks or sheep, which must be stirred as it is drawn from the animal to prevent the parts from separating, and it ought to be stirred both ways, for a quarter of an hour: the liquor, however, is not always in a proper condition for being refined with this ingredient, on which account a little of it ought always to be tried in a phial: a quart or less will be sufficient for a hogshead. After the blood is poured in, the liquor should be violently agitated to mix the whole intimately together: this is done by a stick slit into four, and inserted into the bung-hole, working it briskly about in the liquor, until the whole be thoroughly mixed; in about twenty-four hours the blood will have subsided, the liquor ought instantly to be racked off, as by remaining upon the blood it will receive a taint. This refinement with the blood carries down not only the feculencies, but the colour also, rendering the liquor, though ever so highly coloured before, almost as limpid as water. Isinglass and eggs are also used for refining cyder.

Shutting up the Cyder in close Casks.—In the practice of the most cautious managers, the bungs are first driven in lightly when the liquor is fine and the vinous fermentation is judged to be over; and some time afterwards, when all danger is past, the casks are filled up, and the bung driven securely with a rag, and both resined over at top. Most farmers are of opinion, that after the liquor has done fermenting it ought to have something to feed upon; that is, to prevent its running into the acetous fermentation, wherefore isinglass is as proper as any thing.

Bottling.—This depends greatly on the quality of the liquors themselves: good cyder can seldom be bottled with propriety until a year old, sometimes not till two. The proper time is when it has acquired the utmost degree of flavour and richness in the casks: and this it will preserve for many years in bottles. It ought to be quite fine at the time of bottling; or if not so naturally, ought to be fined artificially with isinglass and eggs.

The liquor called *cyderkin*, *purre*, or *perkin*, is made of the gross matter remaining after the cyder is pressed out. To make this liquor, it is put into a large vat with a proper quantity of boiled water, which has stood till it is cold again; if half the quantity of water is used that there was cyder, it will be good, if more it will be small. The whole is left to infuse forty-eight hours, and then well pressed; what is squeezed out by the press is immediately tunned up and stopped: it is fit to drink in a few days. It clarifies itself, and serves as small beer. It will keep if boiled after pressing with a convenient quantity of hops.

Cyder wine is made from the juice of the apples taken from the press and boiled: when kept three or four years, it is said to resemble Rhenish. The method of preparing this wine, as communicated by Dr. Rush of America, consists in evaporating in a brewing copper the fresh apple-juice, till half of it is wasted; the remainder is then conveyed into a wooden cooler, and afterwards put into a proper cask with an addition of yeast, and is fermented in the ordinary way. This wine, however, so prepared is found to contain a minute impregnation of copper, sufficient to put the public on their guard.

Perry is a most wholesome pleasant liquor of the cyder kind, some of which is so excellent as to pass for Champaign in taverns and other places of public resort.

Perry is prepared from pears, in the same manner as cyder is from apples. The harsher sorts of pears make the best perry, though they are infinitely too acerb for eating. The most esteemed for the purpose are the Bosbury pear, in Worcestershire, and the squash pear, as it is called, in Gloucestershire; in both which counties, as well as in some of the adjacent parts, they are planted in the hedge-rows and most common fields. There is this advantage attending pear-trees, that they will thrive in lands where apples will not so much as live: and that some of them grow to such a size, that a single pear-tree, particularly of the Bosbury kind, has been known to yield in one season from one to four hogsheads of perry. The Bosbury pear is thought to yield the most lasting and vinous liquor. Pears, as well as apples, should be fully ripe before they are ground. Crab apples are frequently mixed with the pears, and are said to improve the perry. Cyder is subject to the laws of excise, as also perry, if made for sale. 43 Geo. 3. c. 69. and 45 Geo. 3. c. 30.

CIMOLIA alba, the name of the earth of which tobacco-pipes are made. Its distinguishing characters are, that it is a dense, compact, heavy earth, of a dull colour, and very close texture; it will not easily break between the fingers, and slightly stains the fingers in handling. It adheres to the tongue, melts slowly in the mouth, and is not readily diffused in water. It is found in the Isle of Wight, Dorsetshire, and Staffordshire.

CIMOLIA nigra, is of a dark lead-colour, hard, dry, and heavy; it does not stain the hands, and is not acted upon by acids. It burns perfectly white, and acquires a great degree of hardness. It is found in Northamptonshire, where it is used in the manufacture of tobacco-pipes.

CINNABAR, (GER. *Zinnober*. DU. *Cinaber*. Vermilioen. DA. *Zinober*. SW. *Cinnober*. FR. *Cinnobre*. IT. *Cinabro*. SP. and PORT. *Cinabrio*. RUS. *Kinowar*. POL. *Cynobr*. LAT. *Cinnabrium*.) Native cin-

nabar is a ponderous mineral substance composed of mercury and sulphur, found in Spain, Hungary, and in several other parts of the world. The finest sort is brought from the East Indies: this is of a red colour, which improves much upon being ground into a fine powder: there is another sort of a good colour, in roundish drops, smooth on the outside, and striated within. Cinnabar reduced to powder is vermillion, used by painters.

CINNAMON. See BARK.

CINQUE-PORTS, (*quinque portus*.) The cinque-ports, as we now account them, are, Dover, Sandwich, Rumney, Winchelsea, and Rye; and to these we may add Hythe and Hastings, which are reckoned as part or members of the cinque ports: though by the first institution it is said that Winchelsea and Rye were added as members, and that the others were the cinque ports; there are also several other towns adjoining that have the privileges of the ports. These cinque-ports have an especial governor, called lord warden of the cinque-ports, and divers privileges granted them, as a peculiar jurisdiction; their warden having not only the authority of an admiral amongst them, but of sending out writs in his own name, &c. Stat. 32 Hen. 8. c. 48. 4 Inst. 222. To hold pleas, &c. and the king's writs do not run there.

If any erroneous judgment is given in the cinque-ports before any of the mayors and jurats, writ of error lies not in B. R. but it shall be redressed, according to the custom, *coram domino custode quinque portuum apud curiam suam*, &c. And the mayor and jurats may be fined, and the mayor removed, &c. 4 Inst. 334. *Crompt. Jurist.* 138.

The cinque ports cannot award process of outlawry. *Cro. Eliz.* 910. And a *quo minus* from the Exchequer lies to the cinque-ports, *Ibid.* 911. Also if a man is imprisoned at Dover by the lord warden, an *habeas corpus* may be issued. *Cro. Jac.* 543. 1 Nels. Abr. 447.

Also a *certiorari* lies to the cinque ports, to remove indictments, before the mayors, barons, &c. as justices of peace, on late statutes, &c. *Cro. Car.* 252. See **titles NAVIGATION and PILOTS**.

CIRCULAR letters, are printed epistles, sent by merchants or others to their various correspondents, either to inform them of dissolutions of partnerships, or the forming of new connections, &c.

CIRCULAR sailing, in navigation, is the method of sailing by the arch of a great circle.

CITRON, (GER. DU. and SW. *Succade*. DA. *Sukkat*. IT. *Confetti di cedro*. SP. *Acitron verde*. PORT. *Cidrao*. FR. *Citronat verd*.) an agreeable fruit, resembling a lemon in colour, smell, and taste. The inside is white, fleshy, and thick, containing

but a small quantity of pulp, in proportion to the size of the fruit; it comes to us preserved or candied from Madeira of the finest quality.

CIVET, (GER. *Zibeth*. DU. *Civet*. DA. and SW. *Zibet*. FR. *Civette*. IT. *Zibetto*. SP. and PORT. *Algalia*. RUS. *Zibet*. POL. *Zybet*. LAT. *Zibetta*, *Zibethum*,) a perfume taken from the civet cat. This little animal is not unlike the domestic cat; and the perfume is formed like a kind of grease, in a bag under its tail. See **MUSK**.

CLAMP, in a ship, denotes a piece of timber applied to a mast or yard, to prevent the wood from bursting: and also a thick plank lying fore and aft under the beams of the first orlop, or second deck, and is the same that the rising timbers are to the deck.

Clamp is likewise the term for a pile of unburnt bricks built up for burning.

CLAMPING, in joinery, is the fitting a piece of board with the grain to another piece of board across the grain. Thus the ends of tables are commonly clamped to prevent their warping.

CLAP-BOARDS, (GER. *Klappholz*. DU. *Klaphosut*. DA. *Klapholt*. SW. *Klappholts*. FR. *Bordillon*. SP. *Madera para cubas y teneles*. RUS. *Klepki duboiijga*,) are small boards cut in order to make casks or vessels.

CLARET, a French red wine, made in the neighbourhood of Bourdeaux, &c. See **WINE**.

CLARION, a kind of trumpet, the tube of which is narrower, and its tone acuter and shriller, than that of the common trumpet; it is now used among the Moors, and Portuguese, and served anciently for a treble to several trumpets, which sounded tenor and bass.

CLASPS, (GER. and DU. *Spangen*. DA. *Hegter*. KROGE. SW. *Spännar*. FR. *Boucles*, *Agraffes*. IT. *Fibbiagli*, *Borchie*. SP. *Broches*, *Corchetes*. PORT. *Broches*, *Colchetes*. RUS. *Prüshkü*,) are made of brass, steel, silver, &c. as hold-fasts for pocket-books, letter-cases, &c. and are principally manufactured at London, Birmingham, Sheffield, &c.

CLAY, (GER. *Thon*. DU. *Kley*. DA. *Leer*. SW. *Lera*. FR. *Argile*. IT. *Argilla*, *Argiglia*. SP. *Arcilla*, *Barro*. RUS. and POL. *Glina*. LAT. *Argilla*,) in a general sense, signifies unctuous or tenacious earth: there are various kinds of clay which are used in many manufactures, such are pipe-clay, potter's earth, &c.

CLEAT, on ship-board, a piece of wood fixed to the yard-arm, to keep the ropes from slipping off.

CLERK, in the way of trade and business, is one who exercises any function with the pen.

CLERK of the market, an officer of the king, to whom is given the charge of the

king's measures and weights, the standard of those that ought to be used all over England.

CLEW of a sail, in naval affairs, is the lower corner of it, to which are made fast the sheets and tacks: a square sail has no clew.

CLEW-GARNET, a rope made fast to the clew of the sail, and running thence to the block, seized to the middle of the main and fore-yard; which in the furling, hauls up the clew of the sail close to the middle of the yard.

CLEW-LINE, the same to the topsails, top-gallant-sails, and sprit-sails, that the clew-garnet is to the main-sail and fore-sail, and of the same use.

CLINCH, that part of a cable which is bent about the ring of the anchor, and then seized, or made fast.

CLINCHING, a kind of slight caulking at sea, about the ports.

CLOCK, (*Clocks*. GER. *Uhren*, *Grosse Uhren*, *Wanduhren*. DU. *Uuren*, *Uurwerken*, *Horologien*. DA. *Uhrverk*, *Stueuhr*. SW. *Ur*, *Klockor*. FR. *Horloges*. IT. *Orologgi*, *Oriuoli*. SP. *Relojos*. PORT. *Relogios*. RUS. *Tschasii*. POL. *Zegar*,) a kind of movement or machine, serving to measure and strike time. The usual chronometers are watches and clocks: the former are such as show the parts of time; the latter, such as publish it by striking; though the name *watch* is commonly appropriated to pocket clocks; and that of *clock* to larger machines, whether they strike or not.

By stat. 9 & 10 W. 3. c. 28. s. 2. no person shall export out of this kingdom any outward or inward box, case, or dial-plate, of gold, silver, brass, or other metal, for clock or watch, without the movement in or with every such box, &c. made up fit for use, with the maker's name engraved thereon; nor shall any person make up any clock or watch, without putting his name and place of abode, or freedom, and no other name or place on every clock or watch, on penalty of forfeiting every such box, case, and dial-plate, clock and watch, not made up and engraven as aforesaid; and 20*l*. one moiety to the king; the other to those that shall sue for the same.

By 27 Geo. 2. c. 7. clock and watch makers are specially protected against the frauds of their servants and workmen, by summary process before justices of the peace, under heavy penalties.

CLOFF, that in which any kind of goods are packed, for the convenience of carriage, as the bags of pepper, pimento, cotton, coffee, hops, &c.

CLOTH, (GER. *Tuch*, *Laken*. DU. *Doek*, *Laken*. DA. *Klæde*. SW. *Kläde*. FR. *Drap*. IT. *Panno*, *panno lano*. SP. *Pano*. PORT. *Pano*, *pano de laa*. RUS. and POL. *Sukno*,) a manufacture made of wool woven on the loom. The term is applicable also to

other manufactures made of hemp; flax; &c. But in a more particular sense it implies the web or tissue of woollen threads interwoven; some whereof called the warp, are extended in length from one end of the piece to the other; the rest called the woof, disposed across the first, or breadthwise of the piece. The best wool for the manufacturing of cloths are those of England and Spain.

The fine cloths manufactured in England were formerly, if not wholly, at least partly, composed of wool imported from Spain, and in the manufacture so produced, the French, who were supplied from the same market, much excelled us. Of late, however, partly from the introduction of the Merino breed of sheep, and partly from more attention having been paid to some kinds that were indigenous, especially the South-down, our fine cloths are arrived at a state of great perfection, and rival the French in all the markets of the world. Our coarse cloths still retain that superiority for demand which they have always had. The former are principally manufactured in Wiltshire, and the western counties, the latter in Yorkshire.

By reference to the *tittles* AFRICA, ASIA, and AMERICA, respectively, it may be seen what are the principal markets on those continents for British cloths. The recent convulsions of Europe having diverted the trade of Great Britain from many of its accustomed channels, and the new regulations of the continental states, arising principally from transfers of territory, render it a matter of more difficulty to define with precision the course of the European trade in this article. Suffice it here to observe, that, among the prohibited articles of Russian import by the tariff of 1817, are "fine black cloth, and all coarse cloths and baizes." For further information, see *tittle* EUROPE.

The woollen manufacture is protected by divers statutes. By the 25 Hen. 8. c. 17. amended by 28 Geo. 3. c. 58. the winding of wool is regulated.

By 49 Geo. 3. c. 109. the true working of woollen cloth is directed. The fulling of woollen cloth by 7 Edw. 4. c. 3.

By 49 Geo. 3. c. 109. the dyeing of woollen cloth is regulated, and certain searchers appointed.

By the same statute the manner of stretching it is pointed out, and it is protected from the depredations of thieves while on the tenters. The cloths of the west counties especially are regulated and protected by 10 Ann. c. 16. and 1 Geo. 1. c. 15. Those of Yorkshire by 11 Geo. 2. c. 28. 5 Geo. 3. c. 51. 6 Geo. 3. c. 25. and 49 Geo. 3. c. 109. See further 2 Dick. Pract. Expos. 1106.

CLOTHES. See WEARING APPAREL,

CLOTHIER, or CLOTH-WORKER, the

manufacturer of woollen cloths. There is a public company in London, called the *Cloth-workers' Company*.

CLOUGH, or draught, an allowance of two pounds to every three hundred weight, for the turn of the scale, that the commodity may hold out when sold by retail.

CLOVE, a term used in weights. Seven pounds of wool make a clove. In Essex, eight pounds of cheese and butter go to the clove.

CLOVER, (GER. *Klee*. DU. *Klaver*. DA. *Klever*, *Klöver*. SW. *Väpling*. FR. *Trefle*, *Luzerne*. IT. *Trifoglio*. SP. *Trebol*. PORT. *Trevo*. RUS. *Trifistnik*. POL. *Konicz*, *Konik*. LAT. *Trifolium*.) an excellent sort of grass, the seed of which was usually imported from Holland, and is of two sorts, the red and white. Considerable quantities are now produced in Great Britain, equal to that of Holland.

According to the modern mode of husbandry, this seed stands pre-eminent above all others for *laying down* land, as it is usually termed, or converting arable land into pasture. The red sort is only considered as an annual, though in fact it will continue two, or even three years; but the white is a perennial, and is that which, together with rye-grass, is used to make permanent pastures.

CLOVES, (GER. *Nägeln*, *Gewürznelken*. DU. *Kruidnagelen*. DA. *Nelliker*, *Krydenelliker*. SW. *Kryddneglikor*. FR. *Clous de girofle*, *Girofles*. IT. *Chiovi di garofano*, *Garofani*, *Garofoli*. SP. *Clavos de especia*, *Clavillos*. PORT. *Cravos da India*, *Cravos girofes*. RUS. *Gwosdika*. POL. *Gozdziki Kramne*. LAT. *Caryophylli*, or *Caryophylli aromatici*.) The clove is a native of the Molucca islands.

At Amboyna the company have allotted the inhabitants 4000 parcels of land, on each of which they were at first allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually on an average more than two pounds of cloves, and consequently the collective produce must weigh more than a million. See *tittle*, *Islands of ASIA*.

COACH, (*Coaches*. GER. *Kutschen*. DU. *Koetsen*. DA. *Kareet*. SW. *Kuskvagn*. FR. *Carosses*. IT. *Carrozze*. SP. and PORT. *Coches*. RUS. *Karetii*. POL. *Karety*.) a commodious vehicle for travelling, so well known as to need no description. Their invention was owing to the French, about the reign of their Francis I. Coaches on the most elegant construction are made in London, whence they are exported to the continent, the East Indies, and America; but are now among the articles prohibited to be imported into Russia.

All kinds of coaches travelling for hire in Great Britain, are under regulations by different statutes. For coaches travelling post, see 2 Dick. Pract. Expos. 751. For

hackney coaches in London, *see* 3 *Dick. Pract. Expos.* 507.

COACHMAKER. The wares of coachmakers shall be examined by persons appointed by the saddler's company. 1 *Jac. c.* 22. And every coachmaker shall take out an annual licence from the excise office, and pay a duty of 20s. for every four-wheeled carriage, and 10s. for every two-wheeled carriage, built by him for sale. Coachmakers were incorporated into a company in the year 1677, in the reign of Charles II.

COAK is used for exciting intense heats, for chemical purposes, or for smelting iron ore, and for operations in which common coal would be detrimental, as the drying of malt. Coak is fossil coal previously charred by an operation similar to that by which charcoal is made. *See* CHARCOAL.

COAL, (GER. *Steinkohlen*. DU. *Steenkoolen*. DA. *Steenkull*. SW. *Stenkol*. FR. *Charbon de terre*. IT. *Carboni fossili*. SP. *Carbones de tierra*, *Carbones de piedra*. PORT. *Carvoes de terra*, *ou de Pedra*. RUS. *Ugolje Kamemoe*. LAT. *Lithanthrax*.) or *pit-coal*. The substances belonging to this genus are composed chiefly of carbon and bitumen. There are six species, viz.

1. *Jet*. This substance is found in France, Spain, Germany, Britain, and other countries. It is found in detached kidney-form masses, of various sizes, from an inch to seven or eight feet in length. The colour is full black: internal, glossy, opaque: not so brittle as asphaltum: texture striated; fracture conchoidal. Specific gravity 1.259. It has no smell except when heated, and then it resembles asphaltum in its odour. It melts in a strong heat, burns with a greenish flame, and leaves an earthy residuum. Becomes electric by friction; and when distilled, it yields a peculiar acid.

2. *Cannel coal* is found in Lancashire, and in different parts of Scotland. The colour is black, opaque: structure sometimes slaty: texture compact: fracture conchoidal: brittle. Specific gravity 1.232 to 1.426. Does not stain the fingers. Kindles easily, and burns with a bright white flame like a candle, which lasts but a very short time; it is susceptible of polish; and like jet, is often wrought into trinkets, tea ware, &c. *See* CANNEL COAL.

3. *Common coal*. This very useful combustible is never found in the primitive mountains, but only in the secondary mountains, or in plains formed of the same materials with them. It is always in strata, and generally alternates with clay, sand-stone, or lime-stone. The colour is black, more or less perfect. Lustre usually greasy or metallic. Opaque. Structure generally slaty. Texture often foliated. Fracture various. Specific gravity 1.25 to 1.37. Usually stains the fingers. Takes fire more slowly, and burns longer than the last species. Cakes more or less during combustion. Of this

species there are many varieties, distinguished in Great Britain by the names of caking coal, rock coal, &c. which are too well known to require any description.

4. *Spurious coal* is generally found amidst strata of genuine coal. It is also called *Parrot-coal* in Scotland. Its colour is greyish black. Structure usually slaty. Texture earthy. Specific gravity 1.5 to 1.6. Generally explodes, and bursts when heated. Composed of charcoal, maltha, and asphalt, and above twenty of stony matter.

5. *Anthracite*. Dolomieu informs us, that this substance is found exclusively in the primitive mountains. It is commonly amorphous, sometimes crystallized in short hexagonal prisms. Colour black, or brownish black. Structure slaty. Specific gravity 1.500. Often stains the fingers. Burns precisely like the last species, and leaves .40 of white ashes.

6. *Kilkenny coal*. This mineral has been found in Hungary, Italy, France, Ireland, and Wales. It occurs in stratified masses, or in lumps nested in clay. The colour is black. Opaque. Texture foliated. Specific gravity 1.4 to 1.526. Often stains the fingers. Insoluble in acids. Deflagrates with nitre. Does not burn till wholly ignited, and then consumes slowly without emitting flame or smoke. It consists almost entirely of charcoal.

For particulars relative to the British Coal Trade, *see* article EUROPE.

COAL, SMALL, a sort of charcoal prepared from the spray and brushwood stripped off from the branches of coppice-wood, sometimes bound in bavons for that purpose, and sometimes charred without binding, and then it is called coneing it together. The wood they dispose on a level floor, and setting a portion of it on fire, they throw on more and more as fast as it kindles, whence arises a sudden blaze, till all is burnt that was near the place. As soon as all the wood is thrown on, they cast water on the heap from a large scoop, and thus keep plying the heap of glowing coals, which stops the fury of the fire; while, with a rake, they spread it open, and turn it with shovels till no more fire appears. Then they shovel them up into great heaps, and when thoroughly cold, put them in sacks, to be used by divers artificers to temper and anneal their several works. Small-coal was formerly much used in kindling-fires, but at present it is dispensed with for that purpose.

COAL-LAWS. Sea-coal brought into the Thames shall be sold by the chaldron, containing 36 bushels heaped up in the form of a cone, according to the bushel sealed for that purpose at Guildhall.

Coals, within the bills of mortality, shall be carried in linen sacks, sealed by the proper officer, which shall be at least four feet four inches in length, and twenty-six inches in breadth; and sellers of coals by the chal-

dron, or less quantity, shall put three bushels of coals into each sack. 3 and 32 Geo. 2. c. 26. and 27.

All sellers of coals are to keep a lawful bushel, which bushel and other measures shall be edged with iron and sealed; and using others, or altering them, incurs a penalty of 50*l*. Any purchaser dissatisfied with the measure of any coals, may, on delivery to him of the meter's ticket, have the same remeasured, by sending notice thereof to the seller, and to the land coal-meter's office for the district in which the coals were sold; on which a meter (not being the same under whose inspection the coals were originally measured) must, within two hours, attend to remeasure the coals, and shall remeasure the same sack by sack, in the presence of the seller and purchaser (if they attend), and also in the presence of a meter from the two other districts (whose attendance within London and Westminster is enforced by a penalty of 5*l*. but not in Surry); for this attendance the purchaser is to pay each coal-meter attending 6*d*. per chaldron. If the coals prove deficient in measure, the seller shall forfeit 5*l*. for every bushel deficient, and also forfeit the coals to the poor. The meter under whose inspection the coals were measured at the wharf, shall also forfeit 5*l*. per bushel deficient, to be recovered (if not in five days) of the principal coal-meter; and coal-porters 2*s*. 6*d*. per bushel. The carman is to be paid 2*s*. 6*d*. for his horses, &c. for each hour, whilst the coals are remeasuring.

Any coal-factor receiving, or coal-owner giving any gratuity for buying or selling any particular sort of coals, and selling one kind of coals for and as a sort which they really are not, shall forfeit 500*l*. 3 Geo. 2. c. 26.

Owners or masters of ships shall not enhance the price of coals in the river Thames, by keeping turn in delivering coals there, under the penalty of 100*l*. 4 Geo. 2. c. 30.

Contracts between coal-owners, &c. and merchants of ships, for restraining the buying of coals, are void, and the parties shall forfeit 100*l*. 9 Ann. c. 28.

Wilfully and maliciously setting on fire any mine, pit, or delph of coal, or cannell-coal, is felony without the benefit of clergy. 10 Geo. 2. c. 32.

Setting fire to, demolishing, or otherwise damaging, any engine or any other thing belonging to coal-mines, is felony and transportation for seven years. 9 Geo. 3. c. 29. and 56 Geo. 3. c. 73.

COASTING. That part of navigation where the places assigned are not far distant, so that a ship may sail in sight of land, or within soundings, between them. In this there are only required a good knowledge of the land, and the use of the compass and lead, or sounding-line.

COATS, in a ship, are pieces of tarred canvas put about the masts at the partners to keep out water. They are also used at the rudder's head, and about the pumps at the decks, that no water may go down there.

COBALT, (GER. *Kobalt*. DU. *Kobald*. DA. *Kobold*. SW. *Cobolt*. FR. *Cobalt*. IT. *Sp.* and PORT. *Cobalto*. RUS. and POL. *Kobolt*. LAT. *Cobaltum*.) a metal found in the form of an ore, in Saxony, Sweden, in the Mendip Hills in Somersetshire, and in Cornwall. It is principally employed in the state of oxide, in which it is of a beautiful blue colour, called zaffre. There is also a black oxide of cobalt. The oxide of cobalt is the most permanent blue with which we are acquainted, and is much used for staining glass, and painting on porcelain: it was formerly employed in painting. Muriate of cobalt, much diluted, forms Hellot's sympathetic ink. Whatever is written on paper with this, remains invisible when cold, but on heating it, it assumes a fine green or blue colour: the former happens when it contains iron. See title INK.

COBILE, COVID, or COUDE, a long measure used in several parts of India, being unequal, and varying as the yard does in Europe. At Surat, Mons. Tavernier makes it two feet and sixteen lines, and it is divided into twenty-four tasots, each tasot a trifle more than an inch.

COCCULUS INDICUS, a poisonous berry, too frequently mixed with malt liquors, in order to make them intoxicating; but this practice is expressly forbidden by act of parliament, 12 Ann. c. 2. and 56 G. 3. c. 58, which latter statute prohibits druggists from even selling to brewers this and other noxious drugs, under very severe penalties. Fishermen have a mode of mixing it with paste; this the fish swallow greedily, and are thereby rendered lifeless for a time, and float on the water.

COCHINEAL, (GER. *Koschenilje*. DU. *Conchenilje*. DA. SW. and FR. *Cochenille*. IT. *Cocciniglia*. SP. *Cochinilla*, *Grana*. PORT. *Cochenilha*. RUS. *Konsseuel*. POL. *Konszeuel*. LAT. *Cochinella*, *Cocci cacti*.) a drug, in many respects approaching to the nature of *kermes*. Though properly an animal, it has, like the other, been long accounted a vegetable production. Cochineal is a small body of an irregular figure: it is always, however, oblong, convex on one side, and a little concave on the other; it is marked with several transverse furrows, like the incisures on the backs of the generality of insects. It is very light, and of a friable texture, easily crumbled to pieces between the fingers. Its colour is a dark purplish, almost black on the surface, and a fine strong crimson within. Some of it is of a dusky grey on the surface, with a mixture of red in it, and this is esteemed the finest of all. It is brought to us from Mexico,

where it is collected in very great quantities. We likewise import an inferior sort of cochineal from the East Indies, but this sort is only worth from 3s. to 6s. per pound, while that brought from Mexico sells from 25s. to 35s. per lb. according to its quality. This article is used very much in the scarlet dye, and other kinds of red dyes, (see DYEING and CARMINE,) which it readily communicates to wool and silk, but with more difficulty to linen and cotton. The two sexes of this insect are exceedingly dissimilar in their appearance. The female, which alone is valuable for its colour, is ill-shaped, tardy, and stupid: its eyes, mouth, and antennæ, are fixed so deep, and are so concealed in the folds of the skin, that it is impossible to distinguish them without a microscope. The male is very scarce, and one is sufficient for 300 females or more: it is very active, small, and slender, in comparison with the female; its neck is narrower than the head, and still narrower than the rest of the body.

The cochineal insect may, in some circumstances, be compared to the silk-worm, particularly in the manner of depositing its eggs. The insects destined for this purpose are taken at a proper time of their growth, and put into a box well closed, and lined with a coarse cloth, lest any of them should be lost; and in this confinement they lay their eggs and die. The box is kept close shut till the time of placing the eggs on the nopal, when, if any motion is perceived, it is a sufficient indication that the animalcule has life, though the egg is so minute as hardly to be perceived; and this is the seed placed on the foliage of the *cactus cochenilifer*, or Indian fig, known to the Spaniards by the name of nopal, the quantity contained in the shell of a hen's egg being sufficient for covering a whole plant. At Oaxaca, cochineal insects are gathered in large quantities, and form a branch of commerce; the cultivation of these little creatures being there the chief employment of the Indians. In trade, four sorts of cochineal are distinguished, *mastique*, *campeschane*, *tetraschale*, and *sylvester*; of which the first sort is esteemed the best, and the last sort the worst.

COCK - BOATS, those used only in rivers and near the shores.

COCKEIN, an imaginary specie, used in Japan, in accounts, like the pistole in many parts of Europe, being in value about ten livres French money, or 8s. 4d. British.

COCKET, **COCKETTUM**, **COCKETUM**, the cocket-office in the Custom-house, where goods to be exported are first entered, and pay their custom. Where the exporter is to have a cocket (written on a piece of parchment), signifying that his merchandise is customed, and may be discharged. See CUSTOMS.

COCK-PIT, in a ship of war, a place on the lower floor or deck, abaft the main-captain, lying between the platform and the steward's room, where are partitions for the purser, surgeon, and his mates.

COCKSWAIN, by corruption, **COXEN**, an officer on board a ship of war, who has the care of the barge and all things belonging to it, and must be also ready with his crew to man the boat on all occasions: he sits at the stern of the boat, and steers.

COCK - WATER, among miners, a stream of water, brought into a trough, to wash away the sand from tin ore, while stamping in the middle.

COCOA, or **CACAO NUT**, (GER. DA. Sw. and Rus. *Kakao*. FR. IT. SP. PORT. and LAT. *Cacao*. DU. *Kakau*. POL. *Kakowy orzech*.) in natural history, is a kind of nut growing on a tree, common in the West Indies. The cocoa or chocolate-nut is a fruit of an oblong figure, resembling a large olive in size and shape, but rather thinner in proportion to its length, and in some degree approaching to the almond or pistachia-nut: it is larger, however, than either of these last. It is composed of a thin, but hard and woody coat or skin, of a dark blackish colour, and of a kernel within this, filling up its whole cavity, fleshy, dry, firm, and flattish to the touch, of a dusky colour, with a mixture approaching to red on the surface, and of a greyish-brown within. It is composed of several irregular and unequal parts, which, however, cohere firmly enough together, and it is of a very fragrant and agreeable smell, and of a pleasant and peculiar taste, with something of the acerb in it.

The cocoa or chocolate-nuts are found in the cavity of the large nut, and are usually to the number of 50 in each fruit; and it is of those nuts that chocolate is manufactured. See CHOCOLATE.

COCOS, (*Cocoa Nuts*. GER. *Kokosnüsse*. DU. *Kokosnooten*. DA. *Kokosnødder*. SW. *Cocosnotter*. FR. SP. and PORT. *Cocos*. IT. *Cocchi*. RUS. and POL. *Kokos*. LAT. *Nuces Indicae*.) the tree which produces the cocoa-nut. This tree is supposed to be a native of the Maldives and other islands in the East Indies, and thence to have been transported to all the warm parts of America: for it is not found in any of the inland parts, nor any where far distant from settlements. It frequently grows to the height of 60 feet. The nuts hang at the top of the trunk in clusters of a dozen each. Each nut, next the stem, has three holes closely stopped; one being wider, and more easily penetrated, than the rest. When the kernel begins to grow, it encrusts the inside of the nut in a blueish, jelly-like substance: as this grows harder, the enclosed liquid, distilled into the nut from the roots, becomes somewhat acid; and the kernel, as

the nut ripens, becomes still more solid, and at length lines the whole inside of the nut for above a quarter of an inch thick, being as white as snow, and of the flavour of a filberd. The quantity of liquor in a full-grown nut is frequently a pint and upwards. The husky tegument of the nut consists of strong, tough, stringy filaments, which, when removed from the fruit, resembles coarse oakum. The leaves are wrought into brooms, hammocks in form of nets, mats, sacks, and other useful utensils. The tree is propagated by planting the nuts, which in six or eight weeks will come up, provided they are fresh and thoroughly ripe: this is what few of them are, when brought into this country; for they are always gathered before they are ripe, that they may keep during the passage.

COD. (GER. *Kabljou*, *Bakalau*. DU. *Kabljauuw*, *Baukaelja*. DA. *Kablau*, *Skreitorsk*, *Bakelau*. SW. *Kabeljo*, *Bakelau*. FR. *Morue*, *Capillaud*. IT. *Baccala*, *Baccalare*. SP. *Bacalao*. PORT. *Bacalhão*.) "The general rendezvous of the cod-fish," says Mr. Pennant, "is on the banks of Newfoundland, and the other sand-banks that lie off the coasts of Cape Breton, Nova Scotia, and New England. They prefer these situations on account of the quantity of worms produced in those sandy bottoms, which tempt them to resort thither for food; but another cause of this particular attachment to these spots is their vicinity to the polar seas, whither they return to spawn: there they deposit their roe in full security, but want of food forces them, as soon as the first more southern seas are open, to repair thither for subsistence. Few are taken north of Iceland, but on the south and west coasts they abound: they are again found to swarm on the coast of Norway, in the Baltic, off the Orkney and the Western isles; after which their numbers decrease, in proportion as they advance towards the south, when they seem quite to cease before they reach the mouth of the Straits of Gibraltar." The great sand-bank on which the cod-fish are taken, is represented as a vast submarine mountain, of above 500 miles long, and near 300 broad, and seamen know when they approach it by the great swell of the sea, and the thick mists that impend over it. The water on the bank is from twenty-two to fifty fathoms; on the outside from sixty to eighty; and on the smaller banks much the same: the increase of shipping that resort to these fertile banks is now incalculable: Great Britain still enjoys the principal share, and it ought to be esteemed one of our chiefest treasures, bringing wealth to individuals, and strength to the state. All this immense fishery is carried on by the hook and line only: the principal baits are herring, the small fish called a capelin, the shell-fish called clams,

and pieces of sea-fowl; and with these are caught sufficient to find employ for upwards of fifteen thousand British seamen, and to afford subsistence to a much more numerous body of people at home, who are engaged in the various manufactures which so vast a fishery demands. The fish, when taken, are properly cleaned, salted, and dried, and in this state sent to various parts of the continent of Europe. The territory, as well as the fishery, from their incalculable value to this country, are protected by more numerous statutes than almost any other dependency of the British crown. See FISHERY and NEWFOUNDLAND.

COD-OIL. (GER. *Leberthran*. DU. *Levertaan*. DA. *Levertran*. SW. *Lefvertran*. FR. *Huile de morues*. IT. *Olio di baccala o merluzzo*. SP. *Aceite de Merluza*. PORT. *Oleo de bacalhão*.) This oil, extracted from the cod-fish, is usually imported by us from Newfoundland, and other parts of America. Cod-oil is applied to nearly the same purposes as whale-oil: it is much used by curriers, and is a good lamp-oil.

COFFEE, (GER. *Koffe*, *Koffebohnen*. DU. *Koffy*, *Koffiboonen*. DA. *Kaffè*, *Kaffebønner*. SW. *Koffe*. FR. IT. and PORT. *Caffè*. SP. *Cafè*. RUS. *Kofè*. POL. *Kawa*. LAT. *Coffea*, *Caffea*.) the berries of a shrub common in Arabia Felix. *Coffee* has some medicinal virtues, which it is foreign to our purpose to expatiate upon, but it is used principally as a food. It is a fruit approaching to an oval or semi-oval form; smaller than a horse-bean, and is of a tough, close, and very hard texture. It is prominent on one side, and flattened on the other, with a large deep furrow which runs along the flattened side. It is moderately heavy, hard to break before it is roasted, and is of a pale greyish colour. There are 10 species, but that which is most worthy of attention is supposed to be a native of Arabia Felix. The *Coffea Arabica* seldom rises more than 16 or 18 feet in height: the main stem grows upright, and is covered with a light brown bark; the branches are produced horizontally and opposite, crossing each other at every joint. The leaves also stand opposite; and when full grown are about four or five inches long, and two broad in the middle, decreasing towards each end; the borders are waved, and the surface is of a lucid green. The flowers are produced in clusters at the root of the leaves, sitting close to the branches; they are tubulous, and spread open at the top, where they are divided into five parts; they are of a pure white, and have a grateful odour, but are of short duration. The fruit, which is the useful part, resembles a cherry. It grows in clusters, and is ranged along the branches under the axillæ of the leaves, of the same green as the laurel, but something longer. When it becomes of a deep red, it is gathered

for exportation. The coffee-tree, we have already observed, is said to have been an indigenous plant of Arabia Felix. It is of little importance to the commercial inquirer, how, or at what period it first passed into other countries. It is sufficient for *our* purpose to observe, that it was in very early repute at Mocha, a port situated at the entrance of the Red Sea, to which place coffee was brought from all the neighbouring districts for exportation. To this day Mocha coffee bears its pristine reputation, as well in Asia, as in Europe, being considered the finest in flavour, as it is the most expensive in price. The next in quality is that from the Isle of Bourbon. It does not appear whether the plant was indigenous there also, but ever since the French took possession of it in 1654, the coffee-tree has been sedulously cultivated. The next coffee in point of reputation in Europe, is that from the island of Java, where the Dutch have cultivated it for more than a century and a half. It is said to have been first carried to Martinico by the French, in 1727; and from thence it soon spread over all the West India Islands. That cultivated by the Dutch in St. Eustatia is best in flavour. We find coffee first noticed in the laws in England, by a statute of 1660, whereby a duty of 4d. was laid on every gallon of coffee sold.

By 20 Geo. 3. c. 55. dealers in coffee, chocolate, &c. must take out an annual licence.

The duties are regulated by 59 Geo. 3. c. 53.

And by 45 Geo. 3. c. 129. If any burnt, scorched, or roasted pease, beans, or other grain or vegetable substance prepared or manufactured for the purpose of being in imitation of, or in any respect to resemble coffee or cocoa, or to serve as a substitute for coffee or cocoa, or alleged or pretended by the possessor or vendor so to be, shall be made or kept for sale, or offered or exposed to sale, or found in the possession of any dealer in or seller of coffee or cocoa; or if such imitation shall be called by the preparer, possessor, or vendor thereof, *English* or *British* coffee, or by the name of *American cocoa*, or *English* or *British* cocoa, the same shall be forfeited together with the packages, and shall be seized by any officer of excise, and the party preparing or selling the same shall forfeit also 100*l.* But now by 5 Geo. 4. c. 53. persons not being dealers in coffee may roast and sell corn, pease, beans, or parsnips, under such name and with a licence, and subject to the various regulations contained in the act. Persons not conforming to the directions of the act to forfeit 100*l.*

COFFILA, a weight of Mocha; 10 coffila make 1 tuckea, 40 tuckea the maun, 10 mauns 1 trassel, 15 trassels the bahar of Mocha, which weighs 420 lbs.

COHI, a large dry measure used in the

kingdom of Siam for corn, &c. It weighs exactly 5000 lbs. British.

COIANG, both a weight and measure of Cambaye in the East Indies, of which five make a last.

COIL, a quantity of rope or cordage, rolled up in the form of a ring.

COIN denotes all the several stamps and species of money in any nation. In earlier times, when the necessity of traffic put men upon the expedient of having money; and metals, on account of their firmness, cleanliness, and durability, were chosen for that end, each person cut his metal into different sizes and forms, according to the quantity to be given for any merchandise, or according to the demand of the seller, or the quantity stipulated between them. It was usual then to go to market laden with metal in proportion to the purchase to be made; and furnished with instruments for proportioning it, and with scales for dealing it out according as occasion required. By degrees it was found more convenient to have pieces ready weighed; and as there were different weights required, all those of the same weight were distinguished with the same mark and figure. At length, the growing commerce of money beginning to be disturbed with frauds both in the weights and the matter, the public authorities interposed, and hence arose the first stamps or impressions of money, to which succeeded the name of the moneyers, and at length the effigies of the prince, the date, legend, and other precautions, to prevent the alteration of the specie; thus were coins completed, and gradually brought to their present perfection. (*See* COINAGE, generally, and for the coins of the world, *see* MONEY.)

The etymology of a word, buried in the remotest antiquity, is of very inferior importance to the reader of a merely practical and elementary book; but of all the conjectures which have been offered on this part of the subject, the most simple and the most natural, seems to be the derivation from the French word *coign*, signifying a corner; every piece of early coin being, according to the foregoing exposition, a square piece of metal having four corners. *Crompt. Jur.* 71. 220.—Coin, at all events, is a generic term, however derived, and comprises “all manner of the several stamps and species of money in any kingdom: and this is one of the royal prerogatives belonging to every sovereign prince, that he alone, in his own dominions, may order and dispose the quantity, value, and fashion, of his coin. But the coin of one king is not current in the kingdom of another; though our king by his prerogative may make any foreign coin lawful money of England at his pleasure, by proclamation.” *Terms de Ley.*

Any person may break or deface pieces of *silver money* suspected to be counterfeit,

or diminished otherwise than by wearing; but if such pieces, on breaking, &c. are found to be *good coin*, it will be at the breaker's peril, who shall stand to the loss of it. 9 & 10 W. 3. cap. 21.

The coin of these realms is, indeed, protected by numerous statutes, too numerous to be individually more than merely adverted to here. Suffice it therefore to notice, that counterfeiting the king's money, or bringing false money into the realm counterfeit to the money of England, clipping, washing, rounding, filing, impairing, diminishing, falsifying, sealing, lightening, edging, colouring, gilding; making, mending, or having in one's possession any puncheon, counter-puncheon, matrix, stamp, dye, pattern, mould, edger, or cutting engine: all these incur the penalty of high treason. And if any person shall counterfeit any such kind of gold or silver, as is not the proper coin of the realm, but current therein by the king's consent, he shall be guilty of high treason. If any person shall tender in payment any counterfeit coins, he shall for the first offence be imprisoned six months, for the second offence two years, and for the third offence shall be guilty of felony without the benefit of clergy. Blanching copper or other base metal, or buying or selling the same; and receiving or paying money at a lower rate than its denomination imports; and also the offence of counterfeiting copper pence, halfpence, and farthings, incur the penalty of felony, but within the benefit of clergy. Counterfeiting coin not the proper coin of this realm, nor permitted to be current therein, is misprision of treason. A person buying or selling, or having in his possession clippings or filings, shall forfeit 500*l.* and be branded in the cheek with the letter R. And any person having in his possession a coining press, or casting bars, and ingots of silver in imitation of Spanish bars or ingots, shall forfeit 500*l.*

Bullion and foreign coin of gold and silver may be imported duty free; but the exportation of gold and silver coin is prohibited without the king's licence, except foreign coin upon entry. *Sec 1 Dick. Pract. Expos.* 299.

The last statute, which was "for the providing a new silver coinage, and regulating the currency of the gold and silver coin of this realm," was the 56 Geo. 3. c. 68. This statute commences by repealing 18 Car. 2. c. 5. which encouraged the bringing in of silver to the mint, by permitting it to be delivered out again in *coin*, according to its intrinsic value, without charge; also 7 & 8 W. 3. and 14 Geo. 3. c. 42. as to the weight of the silver coin; also the 38 Geo. 3. c. 59. prohibiting the importation of light silver coin; and enacts that the pound troy of silver of standard

and fineness of eleven ounces two pennyweights of fine silver, and eighteen pennyweights of alloy in the pound troy, and in weight after the rate of 66*s.* to every pound troy, may be coined into crowns, half-crowns, shillings, sixpences, and pieces of lower denomination. That old *silver coin of the realm*, within a certain period brought to the mint, may be exchanged for its full nominal value in new silver coin. After a certain period (to be determined by proclamation) silver *coin and bullion* brought to the mint shall be coined at the rate of 66*s.* per pound troy of standard silver, eleven ounces two pennyweights fine, &c. of which 62*s.* per pound shall be delivered to the party bringing the bullion, and 4*s.* retained for assaying, loss, and coinage.

Sect. 11. of this statute recites, that gold and silver coin had been at different periods equally a legal tender for payments to any amount, but that inconveniences having arisen therefrom, gold coin only shall hereafter be the only legal tender for any sum above 40*s.*, the said gold coin to be of the weight and fineness prescribed by the present indenture, with his Majesty's Master and Worker of the Mint. And sect. 13. enacts, that such current gold coin shall not be received or paid for more or less than its value according to its legal denomination; and persons offending against this provision shall be deemed guilty of a misdemeanor, and be imprisoned for six months, and find sureties for good behaviour for six months more.

By 59 G. 3. c. 49. gold and silver coin may be exported and melted.

Before we entirely quit this part of the subject, it may not be amiss to enter rather briefly upon an explanation of some of the elementary items which contribute to a perfect comprehension of it, especially with reference to the comparative value of *gold* and *coin* during the fluctuations of their respective commercial values; and also with reference to the terms used in the last mentioned statute, which, for the present period at least, determines the standard of the gold and silver coin of this kingdom.

The weight used for the appreciation of precious metals is the pound, called troy-weight, which was introduced into England in 1066, by William the Conqueror. It derived its origin from the pound instituted by Charlemagne, and its name from Troyes, a city of Champagne, where it was first adopted. The pound troy is divided into 12 ounces, each of 20 pennyweights, which are each divided into 24 grains. The pound is therefore composed of 5760 grains, and the ounce of 480 grains: by a peculiar subdivision of the latter into 20 mites, of a mite into 24 droits, of a droit into 20 periets, and, finally, of a periot into 24 blanks, it required no less than 230,400 blanks to compose a grain; but the lowest denomination which

is now practically used is that of the grain.

The weight agreed upon as the unit of reference of fine gold is that of 24 carats; and in order to express the degrees of inferior fineness, the carat is itself divided into 4 grains, which, being of a different weight from the grains of the pound troy, are distinguished by the appellation of carat-grains. The fractions of such grains have not any particular denomination. Standard gold is that which is to fine gold as 22 are to 24; or, in other words, it is of 22 carats, or 88 carat-grains, being the degree of fineness which is used in the coinage of this metal, and which is also understood when we speak of the commercial price of gold. In the mass, therefore, weighing 24 carats, which we call a pound of standard gold, there are 22 carats of fine gold, the supplementary quantities introduced being 1 carat of fine silver, and 1 carat of fine copper.

The weight agreed upon as the unit of reference of fine silver is that of 12 ounces, each of which is divided into 20 pennyweights, and these are again subdivided into grains of the pound troy. Standard silver is to fine silver in the proportion of 11 ounces 2 pennyweights, or $\frac{37}{40}$, being the degree of fineness which is referred to in the commercial price of silver, and used in the coinage of this metal. In the mass, therefore, weighing 12 ounces, which we call a pound of standard silver, there are 11 oz. 2 dwts. of fine silver, with addition of 18 dwts. of fine copper.

In order to ascertain the degree of fineness of the metals which the Bank of England purchases, they are assayed at the mint. In this process, the refiner prepares his materials by taking a few grains of the metal to be assayed, whether cuttings or scrapings; and, cleansing them from dross, he puts them into the cupel, or test, with a piece of clean lead on the fire, till it be refined to the highest degree. After taking the metal from the fire, the refiner lets it cool, beats it clean, and, having a pair of scales curiously glazed, he puts the refined metal into one scale, and a weight corresponding with the weight of the metal before the operation into the other scale. He then weighs the cupelled metal, computing, by the loss of weight upon the quantity taken, the proportion of loss which there would have been, if a pound or an ounce had been cupelled. By this means, the degree of purity of the mass itself is accurately determined at the Bank, according to the written report of the assay-master, which, in respect to gold, is in carats, carat-grains, and the fractions thereof; and, in respect to silver, in ounces, pennyweights, and half pennyweights.

COINAGE, or, more correctly, the art of coining, or making money, is either performed by the hand, or by a mill. Formerly the fabric of coins was different from what

it is at present. They cut a large plate of metal into several little squares, the corners of which were cut off with sheers. After having shaped these pieces, so as to render them perfectly conformable in point of weight to the standard coin, they took each piece in hand again, to make it exactly round by gentle hammering: this was then called a planchet, which was ready for immediate coining. The engravers then prepared a couple of steel masses in form of dyes, cut and terminated by a flat surface, rounded off at the edges. They engraved or stamped on them the hollow of a head, a cross, a scutcheon, or any other figure, according to the custom of the times, with a short legend. As one of these dyes was to remain dormant, and the other moveable, the former ended in a square prism, that it might be introduced into the square hole of the block, which, being fixed very fast, kept the dye as steady as any vice could have done. The planchet of metal was horizontally laid upon this inferior mass, to receive the stamp of it on one side, and that of the upper dye, wherewith it was covered, on the other. This moveable dye, having its round engraved surface resting on the planchet, had, at its opposite extremity, a flat, larger, and square surface, upon which they gave several heavy blows with a hammer of an enormous size, till the double stamp was sufficiently in relief, impressed on each side of the planchet. The strong tempering which was, and is still, given to the two dyes, rendered them capable of bearing those repeated blows. This art, however, has been improved and rendered very expeditious by several ingenious machines, and by a wise application of the surest physical experiments to the methods of fining, dyeing, and stamping, the different metals. This may perhaps be sufficient for explanation of the mere science of coining, as it is a public concern, not an art or mystery to be executed by individuals with impunity.

The historical detail of the improvements successively made in the manner of accomplishing the coinage, so far as is necessary for the information we profess to give, is contained within a small compass.

During the continuance of the hammered money, or, as it has sometimes been called, the "sledge coining," the best that has ever been produced in this kingdom has been said to be during the Protectorate of Cromwell; but certain it is, that till after the restoration of Charles II. this hammered, or sledge coined money, was the current coin of the realm, and did not cease to be current till the reign of William III., when that method was superseded by the invention of better machinery under the influence of the then Earl of Halifax. The chief coinage of Great Britain is performed in the Tower of London; but of late years Messrs. Bolton and Watt of Solih, near Birming-

ham, have, in consequence of a contract entered into between them and the government, coined at their aforesaid manufactory farthings, halfpence, pence, and two-penny pieces of copper; and to such a state of perfection have these gentlemen, and their successors in the manufactory, brought their machinery, that the method discovered by them has been altogether in principle, and to a great degree in practice, adopted by the master and managers of the mint.

COINING, in the tin works, is the weighing and stamping the blocks of tin with a lion rampant, performed by the king's officer: the duty for every hundred weight being four shillings.

COLE-SEED, (GER. *Rapsaat, Kohlsaet*. DU. *Raapzaad*. DA. *Rapsaat*. SW. *Rapsat*. FR. and IT. *Colza*. SP. *Colzat*. PORT. *Colsa*.) produces a species of cabbage called cole or colza, which grows abundantly in the northern parts of France, and in the Low Countries. There is likewise some of this cabbage grown in Great Britain. The seed called cole-seed yields an oil which is used for burning, as an article of food, and as an ingredient in the manufacture of soap, and the preparation of leather and wool. For the laws respecting its importation, *vide* 2 W. & M. c. 4.; 30 G. 3. c. 41.; 35 G. 3. c. 117.; and 36 G. 3. c. 113.

COLCOTHAR, the *caput mortuum* of vitriol.

COLLAR of a ship, a rope fastened about her beak-head, into which the dead-man's eye is seized, that holds her mainstay. Also, the rope which is wound about the mainmast-head, to save the shrouds from galling, is called a collar.

COLLAR-beam, a beam framed cross betwix two principal rafters.

COLLAR of a plough, an iron ring fixed in the middle of the beam, wherein are inserted the tow and bridle chains. *See* PLOUGH.

COLLECTORS of the Customs, being sued by any but the king, may plead the general issue. 13 & 14 Car. II. c. 17. *See* CUSTOM-HOUSE OFFICERS.

COLLET, in glass-making, is that part of the glass vessels which sticks to the iron instrument wherewith the metal was taken out of the melting-pot: this is afterwards used for making green glass.

COLOCYNTHIS, **COLOQUINTIDA**, or bitter apple, (GER. *Kolokynth*. DU. *Bitter-appelen*. DA. & SW. *Coloquinter*. FR. *Coloquintes*. IT. *Coloquintida*. SP. *Coloquintidas*. PORT. *Coloquintidas*. RUS. *Kolozintü*. POL. *Kolokwintyda*. LAT. *Colocynthidum poma*.) is a round, white, dry, cellular substance, containing in the cavities seeds like those of the cucumber, but round, less flat, and harder: the kernel is oily and of a sweet taste. This drug is the pulp of a fruit about the size of an orange: it is at first of a green colour, but turns yellow as it approaches maturity.

The pulp, which is the only part used in medicine, is very nauseous, acrimonious, and extremely bitter: it is brought to us from Aleppo.

COLOPHONY, (GER. *Kolophonium*, *Geigenharz*. DU. *Vioolhars*. DA. *Fiolinharpiz*, *Colophonium*. SW. *Fiolkada*, *Harts*. FR. *Colophone*. IT. *Colofonio*. SP. *Colofonia*. PORT. *Colophonia*. RUS. *Kanifol*. POL. *Kalofonia*. LAT. *Colophonium*.) in pharmacy, a black resin, or turpentine, boiled in water, and afterwards dried, or the resin remaining after the distillation of the ethereal oil, being farther urged by a more intense and long-continued fire, it yields a thick oil, along with a heavy acid water, which discovers the genuine nature and properties of a resin. *Colophony*, when reduced to a powder, and thrown into the flame of a candle, takes fire and resembles lightning. It is used occasionally in healing of wounds, &c.

COLOUR, in paintings, is used to express the drugs, and the tints produced by those drugs, variously mixed and applied. A brief account of the different pigments or colours which are commonly used either in water, or oil, for the purposes of drawing or painting, must suffice.

Red. Lakes. This term is used to denote a species of colours, formed by the combination of alumina, or the oxyd of tin, with the colouring matters of vegetables. The lakes chiefly used are red colours; and these are of different qualities, according to the basis and colouring matter employed, such as carmine, Florence-lake, and madder-lake.

Carmine is a very rich, bright, crimson colour, and stands well in water. For the preparation of carmine, four ounces of finely pulverized cochineal are to be poured into four or six quarts of rain or distilled water, that has been previously boiled in a pewter kettle, and boiled with it for the space of six minutes longer. Eight scruples of Roman alum, in powder, are to be then added, and the whole kept upon the fire for one minute longer. As soon as the gross powder has subsided, and the decoction has become clear, it is to be carefully decanted into large cylindrical glasses covered over, and kept undisturbed till a fine powder is observed to have settled at the bottom. The liquor is then to be poured off from this powder, which is to be gradually dried. From the liquor, which is still much coloured, the rest of the colouring matter may be separated by means of the solution of tin, when it yields a carmine little inferior to the former.

Florentine lake is the kind in general use known by the name of lake. It is used in water and also in oil, but does not stand; which is much to be regretted, as it is a very beautiful colour, and there is no substitute that will completely answer all the purposes of lake. The best sort may be prepared from the sediment of cochineal that remains

in the kettle after making carmine, adding to it a small quantity of cochineal or Brazil-wood, and precipitating the colouring matter with a solution of tin.

Madder-lake is very little known as a colour. It is not so bright and rich a colour as the last-mentioned lakes, but has this valuable advantage, that it stands much better, and it may answer many of the purposes of Florence-lake. It is prepared nearly in the same manner as the foregoing.

Rose-lake. This is generally called rose-pink. It is a lake made by a basis of chalk, coloured by Brazil or Campeachy wood. It does not stand, and is only used for house-painting and paper-hanging.

Vermilion, a bright scarlet pigment, formed from sulphur and quicksilver; when of a coarse kind, it is called cinnabar. Its goodness is known by its brightness, and its inclining to a crimson hue. It is a very useful colour in oil, where it stands very well; but water is apt to turn it black.

Red-lead, or minium, is lead calcined till it acquires a red colour, by exposing it, with a large surface, to the fire. It is also made from litharge, which is a calx or oxyd of lead; but is not so good as when made directly from metallic lead. This colour is very apt to turn black, both in water and oil, and is therefore seldom used but for very coarse purposes.

Indian-red is a very useful colour, answering some of the purposes of lake: it stands well both in water and oil. It is difficult to procure the genuine kind, which comes from the East Indies. What is sold for Indian-red, is said to be chiefly made in this country.

Venetian-red is a native red ochre, rather inclining to the scarlet than the crimson hue: it is not far different from the common Indian-red, but fouler, and is chiefly used by house-painters.

Spanish-brown is also an earthy substance, found in the same state in which it is used: it is nearly of the same colour as Venetian-red, but coarser. It is used only for the commonest purposes. It does not change.

Light-red, or burnt ochre. This is common yellow ochre, heated red-hot in the fire, till the colour changes from yellow to red. It is a very excellent colour, both in water and oil; having the quality in common with all the ochres, of standing perfectly well.

Red-chalk. This is the same substance as is used for drawing on paper, in the manner of a crayon. It is very much like light red, and is used instead of it for some purposes. It stands perfectly well, and may be used both in water and oil.

Burnt terra di Sienna. This colour is made by calcining raw terra di Sienna till it acquires a red colour. It is of a very rich tint, and is much used both in water and oil. It stands well in both.

Blue. Ultramarine is prepared from lapis lazuli, by calcining and washing it very clean. When genuine, it is an extremely bright blue colour, somewhat transparent both in oil and water, and stands perfectly well. On these accounts it is of the utmost value, being excellent in every kind of painting, even in enamel; but its great price prevents the general use of it.

Ultramarine ashes. These are the residuum after washing the lapis lazuli, in which a portion of the ultramarine still remains. They are very subject to be adulterated. Their colour is not so bright as ultramarine: having like that colour, a tint of red and white in them. When genuine, they stand well.

Prussian-blue. This colour is iron combined with a peculiar acid, called the prussic acid. It is made in the following manner: two parts of purified potass are most intimately blended with three parts of dried and finely pulverized bullock's blood. The mass is first calcined in a covered crucible, and on a moderate fire, until no smoke or flame appears; and it is after this brought to a complete yet moderate ignition: or equal parts of potass and finely powdered coals, prepared from bones, horns, claws, &c. are mingled, and heated in a covered crucible to a moderate redness. This done, either of these two calcined masses is, after cooling, lixiviated with boiling water, and the lixivium filtered. Nothing remains now but to make a solution of one part of green vitriol and two parts of alum; and to add to it while yet hot the above lixivium, little by little however; and to separate the greenish-blue precipitate which then forms by means of a filter. If afterwards a slight quantity of diluted muriatic acid is affused upon this precipitate, it assumes a beautiful dark blue colour. The operation is terminated by edulcorating and drying the pigment thus prepared. Prussian-blue is an extremely beautiful colour when properly prepared, and stands well. Common Prussian-blue is apt to contain some iron, which causes it to turn greenish or olive.

Verditer is a blue pigment, obtained by adding chalk or whiting to the solution of copper in aqua-fortis. The best sort is prepared by the refiners, who employ for this purpose the solution of copper which they obtain in the process of parting, by precipitating silver from aqua-fortis by plates of copper. Common verditer is made from the sulphate of copper or blue, by the manufacturers in Sheffield and Birmingham. Verditer is only used for very coarse purposes, chiefly by the paper-stainers. It has been sometimes called sanders-blue, a corruption of the term *cendres blue*, or blue ashes, the French name for it.

Indigo. This colour is extracted from a plant that grows in the East and West Indies. It is not so bright as Prussian-

blue, but it is cooler, and has the advantage of being very durable. It cannot be dissolved by water, but may be by the sulphuric acid; and it then forms Scott's liquid blue, so much used for colouring silk stockings, &c.

Smalt. This is glass, coloured with cobalt, and ground to a fine powder. Its coarseness prevents its being used much for painting in oil, or water. It is employed sometimes by strewing it upon a ground of oil-paint. It is also used in enamel-painting. It stands well.

Bice is only smalt more finely levigated.

Yellow. Indian-yellow. This is the brightest of all yellows for water-colours, and is perfectly durable. It is said to be procured from the urine of the buffalo. In the East Indies it is a very common and cheap colour: the natives there use it commonly for colouring their calicoes, which they do without any mordant, so that the colour is washed out again when the cloth is dirty.

King's yellow. This colour is orpiment refined; which is a substance dug out of the earth, and consists of sulphur joined to arsenic; or it may be prepared by subliming sulphur with arsenic. It is of a very bright yellow, but does not stand well; and great caution should be used in employing it, as it is a strong poison.

Naples-yellow. This is a very durable and bright yellow; it comes from Naples, and is supposed to be prepared from lead and antimony.

Yellow-ochre. This is an earth coloured by oxyd of iron. It is a cheap colour, and not very bright; but is valuable on account of its standing well. Roman-ochre is a superior kind of yellow ochre.

Dutch-pink. This pigment is formed of chalk, coloured with the juice of French berries, or other vegetables affording a yellow colour. It does not stand, and is chiefly used for common purposes.

Gamboge is a gum brought from the East Indies. It readily dissolves in water, and is a fine bright yellow. It is used only in water, and is very serviceable.

Massicot is an oxyd of lead, prepared by calcined white lead. It is very little used, the colour not being very bright.

Gall-stones. This is a concretion or hard substance, formed in the gall-bladders of beasts; or it may be obtained from the gall of animals. It is a very rich colour, but does not stand.

Raw terra di Sienna is a native ochreous earth brought from Italy. It is a fine warm colour, and stands well.

Orange-lake is the tinging part of annatto precipitated together with the earth of alum. It does not stand.

Brown-pink is the tinging part of some vegetable substance precipitated upon the earth of alum. It is of a fine rich greenish yellow, but does not stand.

Green. There are few colours in more general use than greens. It is the practice with artists to form them by the mixture of blue, and yellow, colours. By varying the proportions of these respectively, a vast variety of green tints may be obtained.

Verdigris. If plates of copper, moistened from time to time with vinegar, are left exposed to the air, they will be converted into a green oxyd, called verdigris. This is prepared in large quantities near Montpellier in France, by stratifying the copper-plates with husks of grapes, yet under vinous fermentation, which soon grow acid, and corrode the copper. After the plates have stood thus, for a sufficient time, they are moistened with water and exposed in heaps to the air. The verdigris is scraped off the surface as it forms. Verdigris is of a bluish green, has no body, and does not stand. It answers best when used in varnishes.

Distilled or crystal-verdigris, is prepared by dissolving common verdigris in vinegar. It is of a very bright green, and is used chiefly for varnishes, and in colouring maps.

Sap green is the concreted juice of the buckthorn berries. It is never used in oil. It is employed chiefly in flower-painting, and colouring prints, &c.

Brown colours. Bistre is the finer part extracted from the soot of burnt wood. It is much used in water-colours. There is an excellent sort prepared in Ireland.

Cologne earth is a mineral substance of a blackish brown.

Burnt umber is a native ochreous earth.

Raw umber is only the last mentioned colour calcined in the fire. It is a deep, rich brown, and stands perfectly well.

Asphaltum is used in oil, and is of a very rich, deep brown. It is a transparent or glazing colour.

White. White lead is the same colour as flake-white, only of an inferior quality. It is the only white used in oil-painting, and it is very useful; but in water it always turns black, and should never be used.

Pure carbonate of lime is very useful as a white in water colours, as it stands perfectly well.

Egg-shell white, and **oyster-shell white**, are only egg-shells, or oyster-shells, calcined, by which the animal gluten is destroyed, leaving the lime behind, which soon attracts the carbonic acid again from the atmosphere.

Well-washed Spanish-white, or common whiting, answers the same purpose.

Black. Lamp-black is the soot of oil collected after it is formed by burning. It is very generally used, both in oil, and water, and stands perfectly well.

Ivory-black is the coal of ivory or other bones, formed by giving them a great heat, while they are deprived of all access of air. It is of a more intense black than lamp-black.

Blue-black is the coal produced by burning vine-stalks in a close vessel. It is like ivory-black, with a tint of blue.

COLOUR, in dyeing. See DYEING.

To COLOUR *stranger's goods*, is when a freeman allows a foreigner to enter goods at the custom-house in his name.

COLOURING, in painting, is the art of applying, and disposing, various colours in such a manner, as to be productive either of an imitation of the natural hues of the objects represented, of harmonious arrangement of tints, or of force and brilliancy of effect.

COMB, an instrument to clean, untangle, and dress, flax, wool, hair, &c. Combs for wool are prohibited to be imported into Great Britain.

COMB *in a ship*, a little piece of timber set under the lower part of the beak-head, near the middle. It has two holes in it, and supplies to the fore-tacks, what the chest-trees do to the main-tacks; that is, it brings the fore-tacks aboard.

COMBS, (for the hair,) (GER. *Kamme*. DU. *Kammen*. DA. *Kamme*. SW. *Kammar*. FR. *Peignes*. IT. *Peltini*. SP. *Peines*. PORT. *Pentes*. RUS. *Grebni*. POL. *Grzebień*. LAT. *Pectines*.) are generally made of horns of bullocks, or of elephants' and sea-horses' teeth: some are made of tortoise-shell, and others of box or holly-woods. Bullocks' horns are thus prepared in order to manufacture combs. The tips are first sawn off; they are then held in the flame of a wood fire: this is called roasting, by which they become nearly as soft as leather. While in that state they are slit open on one side, and pressed in a machine between two iron plates: they are then plunged into a trough of water, from which they come out hard and flat. The comb-maker next saws them into lengths according to the sized combs he wants. To cut the teeth, each piece is fixed in a tool called a clam. The teeth are cut with a fine saw, or rather a pair of saws, and they are finished with a file.

The process used for making ivory combs is nearly the same as that already described, except that the ivory is first sawed into thin slices.

Tortoise-shell combs are much used, and an imitation of them in horn is done in the following manner: the horn to be dyed must be first pressed into a flat form, and then spread over with a paste made of two parts of quick-lime and one of litharge, brought into a proper consistence with soap-ley. This paste must be put over all the parts of the horn, except such as are proper to be left transparent, to give it a nearer resemblance to tortoise-shell. The horn must remain in this state till the paste is quite dry, when it is to be brushed off. It requires taste and judgment to dispose the paste in such a manner as to form a variety of trans-

parent parts of different figures, to look like nature. Some parts should also be semi-transparent; which may be effected by mixing whitening with a part of the paste, to weaken its operation in particular places: by these means spots of a reddish brown will be produced, so as greatly to increase the beauty of the work. This kind of stained horn, if well executed, is little inferior to tortoise-shell.

COMBINATIONS to do unlawful acts are punishable by the common law before the unlawful act is executed; and this is to prevent the consequences of combinations and conspiracies, &c. 9 Rep. 57.

By 39 and 40 Geo. 2. c. 106., every workman who shall enter into any contract for obtaining an advance of wages, altering the usual time of working, decreasing the quantity of work, or the like, (except contracts between masters and men,) shall be committed to the common gaol for not more than three months, or the house of correction for not more than two, on conviction before two justices: as also any workmen entering into any combination for advancing wages, or the like, as above, or who shall wilfully and maliciously endeavour to prevent any workman from hiring himself, or prevail on him to quit his employ, or who shall hinder any master from employing any person, or, without reasonable cause, shall refuse to work with any other workman, and also all persons who shall attend any meeting for the purpose of making any such illegal contract, or who shall summon, or by intimidation, or otherwise, endeavour to induce any journeyman to attend any such meeting for such purpose. s. 1, 2, 3, 4.

No person shall contribute for any expenses incurred for acting contrary to this act, or towards the support of any person to induce him not to work, on penalty not exceeding 10*l.*, and any person collecting money for such purposes shall forfeit not exceeding 3*l.*, one moiety to his majesty, and the other to the informer and the poor of the parish. s. 5.

The offences shall be determined in a summary way before two justices, who shall fix the penalty, and if not paid shall cause it to be levied by distress, or in default thereof shall commit the offender to the common gaol or house of correction. s. 5.

Contributions made for any prohibited purposes shall be forfeited, one moiety to the king, and the other to the person who shall sue for the same. s. 6.

Offenders may be compelled to give evidence, and shall be indemnified from prosecution for any offence whatever to which they give testimony. s. 9.

Justices may summon offenders: and on their not appearing, or in the first instance, may issue warrants for their apprehension, and also on their appearing, or on proof

of their absconding, may convict or acquit the parties. s. 10.

Justices may summon witnesses, and for non-appearance, or refusal to give evidence, may commit them until they submit. s. 11.

No master in the trade in which any offence is charged to have been committed, shall act as a justice under this act. s. 16.

All contracts between masters or other persons for reducing the wages of journeymen, or for altering the usual hours of working, or increasing the quantity of work, shall be void, and masters convicted thereof shall forfeit 20*l.*, one moiety to his majesty, and the other to the informer, and the poor of the parish, which may be levied by distress, and if not paid the offender may be committed for not exceeding three, nor less than two, calendar months. s. 17.

But disputes between masters and workmen may be settled by arbitration. If arbitrators shall not decide the matter within three days after submission to their award, either party may require them to go before a justice, who shall finally determine the same. s. 18. See further, 2 *Dicks. Pract. Expos.* 879.

COMFIT, (*GER. Confits. Konfekt, Konfitüren. DU. Confyh, Banket. DA. & SW. Confect. FR. Confiture, Sucrierie. IT. Confetti. SP. Dulces. PORT. Doces, Confeitos. RUS. & POL. Konfekt.*) a kind of sweetmeat, made by the confectioners, of almonds, caraway-seed, coriander-seed, &c. covered over with a mixture of sugar, flour, and water.

COMMANDERS, or captains of trading vessels, are such head-officers, as have the chief direction and command of merchantmen.

COMMASSE, or CONNUASSE, a small money current at Mocha, and the only one made there; 60 *commasses* and 80 *caveers* (or *cabeers*, in which accounts are kept) make a French crown, and are equivalent to 5*s.* British.

COMMERCE, the exchange of commodities for other articles, or for some representative of value, for which other commodities can be procured. At first commerce consisted merely in exchanging the surplus of some particular article of produce, which an individual possessed beyond what he found necessary for his own use, for the similar surplus of some other article possessed by another individual, which kind of traffic is now generally called barter. By the introduction of metallic, and paper, money, the operations of commerce were much facilitated, while the increase of population rendered them of greater magnitude. Improvements in the art of navigation extended their boundaries, the advancement of science, and increase of luxury, multiplied the objects of trade, and the various duties and regulations established by different governments rendered the subject more complicated to individuals, but at the same time of

increased importance to the state. The advantages of commerce began to engage the attention of mankind at a very early period. About 1300 years after the flood, the commerce of the Phœnicians had attained to a considerable extent; they possessed manufactures, entered into commercial partnerships, made long voyages, had resident agents in foreign countries, and had adopted the practice of lending money on bottomry. The Greeks and Romans, particularly the latter, carried on an extensive trade, considering the imperfect state of navigation. The reign of Augustus was particularly favourable to commerce, as the general peace which then prevailed, enabled the merchants to pursue their concerns unmolested. At this period, Malta was famous for its number of workmen and its various manufactures, particularly of fine cloths. The inhabitants were the descendants of the ancient Phœnicians and, like them, pursued commerce with avidity. Under Tiberius, we find the Romans extending their protection to the north; and the town of Havern, the most ancient in Friesland, founded. The cultivation of vines in France, Spain, and Portugal, seems to have increased about this time; and from the inhabitants neglecting to cultivate corn, and turning much of their arable land into vineyards, we may presume the latter afforded considerable profit. About the year 50, the capital of England was first described as a place famous for merchandise. In the 9th century, the Venetians carried on a very beneficial commerce with the Levant, whence they brought spices, silks, drugs, and fruits from the East in great abundance, and supplied the greater part of Europe with these commodities. The crusades contributed materially to the revival of commerce during the 12th and 15th centuries, by introducing an acquaintance with the luxuries of the East, which multiplied the objects of trade. About this time, the commercial towns bordering on the coast of the Baltic, finding their trade much interrupted by pirates, entered into an agreement for mutual support and assistance. This union, which became very celebrated under the title of the Hanseatic League, at first consisted only of twelve towns, but finally of upwards of seventy, including all the principal commercial places of Europe, and embracing nearly all the foreign trade then carried on. The invention of the mariner's compass, which enabled trading vessels to make much longer voyages, and led to a discovery of a passage to the East Indies by the Cape of Good Hope, with the settlements made on the coast of Africa, in Arabia, and in India, affected very materially the commerce of the Mediterranean and of the Hanse Towns, and threw the principal part of the foreign trade into the hands of the Portuguese. The discovery of America opened a new and exten-

sive field for commercial adventure, while the establishment of manufactures produced new articles of trade. The persecutions of the Spaniards drove great numbers of industrious workmen from the Netherlands into England, and other countries, who introduced several manufactures into England, and greatly improved others which were already established. While the different branches of Britain's manufactures were thus improving, its colonial possessions in the East and West Indies were greatly increased, and England was enabled to rival the Dutch, not only in manufactured goods, but also in the principal articles of colonial produce. During the last century, the trade of Holland rapidly declined; and the decided naval superiority maintained by Great Britain, extended and raised her commerce to a magnitude unparalleled in the history of the world. The natural advantages arising from the situation of this country, and her extensive colonial possessions, particularly in the East Indies, have favoured and protected her commercial intercourse; while the accumulated capital of individuals has gradually enabled them to give very considerable credit to their customers, which of late years has been of much importance in increasing the commerce of Great Britain to its present extent.

In the reign of Edward III. the countries with which England had commercial intercourse, were chiefly France, Spain, Portugal, Flanders, Brabant, and Germany. The total value of commodities exported in one year was reckoned at 294,184*l.* and of all the imports at only 38,970*l.*, sums that are considerably less than the value of the goods now entered in one day. The exports consisted of wool of the value of 277,606*l.*, leather 96*l.* and cloths 16,260*l.* The imports were, cloths, of the value of 11,083*l.*, wax, 815*l.*, wine, 3,841*l.*, linen cloth, mercery, and grocery, 22,943*l.* The policy of the times was by no means calculated to encourage trade: our merchants were very jealous of foreigners participating in their commercial profits, though it was to such persons they were indebted for the little knowledge of trade they possessed; and the government being at times still more jealous in this respect than individuals, many injudicious restrictive laws were made: amongst others, an act was passed in 1429, prohibiting persons from selling goods to aliens, except for ready money. It was, however, soon found necessary to repeal this prohibition, and permission was then given to sell to aliens, upon giving not more than six months' credit. Charles II. imposed a duty of 5 per cent. on goods exported, as well as imported, on domestic manufactures, as well as foreign merchandise, and double taxes on all goods when exported by aliens. In 1672. however, the duties payable by aliens on the

exportation of all goods of British manufacture were repealed.

This salutary principle was still more extended in 1700 by removing the imposts previously laid on every kind of woollen goods exported, and on corn, meal, and bread. It was however by the law "*for the further encouragement of manufactures,*" passed in 1722, that every one was allowed to export duty-free all kinds of merchandise, the produce of Great Britain, except a few particular articles: while drugs and other commodities used for dyeing were also to be permitted to be imported duty-free. This period forms a memorable epoch in commercial policy; and the subsequent increase of trade is the best proof of the wisdom of the regulations then adopted. The various articles of foreign commerce being subject to great fluctuations in their value, a book of rates was adopted at the custom-house in 1696, for the purpose of valuing uniformly the several articles imported and exported; and, consonantly to these estimates, the following statement shows the total amount of the imports and exports of Great Britain every 20th year from 1700 to 1820.

Years.	Imports.	Exports.
1700	—£4,956,975	—£6,034,724
1720	— 6,054,800	— 8,132,669
1740	— 7,270,743	— 10,822,696
1760	— 8,877,145	— 14,253,377
1780	— 11,663,211	— 13,337,562
1800	— 30,570,605	— 43,152,019
1820	— 29,681,836	— 42,802,810

The American war produced a memorable effect on the foreign trade of this country. Previously to that event, our manufacturers were not much in the habit of exporting on their own accounts. The prohibition in America of importation from this country, compelled them to seek new markets, and to improve those already known: and from this date commenced that rapid increase of export to the continent of Europe, which has chiefly enabled us to sustain the burthen of wars in which we have been since engaged. From the peace of 1783, our manufacturers have almost universally acted as merchants, and shipped their goods on their own account. They have gained possession of the foreign market, in part from the superiority of their skill, but far more from the superiority of their capital, which has enabled them to give a credit considerably superior to that which the exporters of other countries can allow. The rapid increase of our commerce which is daily taking place, leaves no room for doubting, that at the expiration of a similar period to that which we have taken for our systematic exposition, the prosperous situation of our commerce will be further exemplified and confirmed; at the same time it is not possible for a reflecting mind to view the prohibitory tariffs of some European powers,

and the naturalization, as it were, of many of our manufactures in America, altogether without apprehension.

Of the total exports of Great Britain, about two-thirds of the value consists of British produce and manufactures, and one-third of foreign merchandise.

The following statement of the year ending 5th January 1821, will show the proportions of the commerce of Great Britain with different parts of the world at that time.

	£.	s.	d.
To Ireland -	3,387,873	11	11
Russia -	3,668,383	0	4
Denmark -	308,575	18	11
Prussia -	1,312,580	6	0
Germany -	9,894,108	0	2

Total -	£51,730,616	18	10

In the commercial intercourse between Great Britain and Ireland, a very unjust and oppressive species of policy was long exercised, by which the latter country was debarred from the enjoyment and use of its own resources. It was shut out from every species of commerce, and restrained from sending the produce of its soil to foreign markets. Under such circumstances, it cannot be supposed that its commerce, even with the country that monopolized it, could be very great.

Early in the last century, some little relaxation of the restrictive system had taken place, and something more had been done in the reign of George II.; but in the year of 1780, Ireland obtained a free trade, and ever since has continued its exports to the markets abroad.

The want of large capitals however among its manufacturers retard its commercial importance; and at the same time its principal imports continue to be the manufactures of Great Britain.

Such was the general state of British commerce at the period up to which we have treated of the particular items which compose it. Since then the fluctuations of it have been so extraordinary and unnatural, first from the success which attended the French Emperor's efforts to shut us out from the commerce of the continent of Europe, and subsequently from the revolution occasioned by the overthrow of his gigantic power, that any attempt at further illustration for the purpose of conveying

elementary knowledge by inferences and deductions from annual exemplifications of its progress, decline, and subsequent restoration, however curious, could lead to no accurate, or useful, conclusions.

We must close this article, therefore, with a general reference, for more particular information on any of the detached subjects which go to compose its comprehensive signification, to *titles* EUROPE, ASIA, AFRICA, AMERICA, CUSTOMS, REVENUE, but especially EXPORTATION and IMPORTATION; only adding, that the total value of the commerce of the United Kingdom, exclusive of intercourse between Great Britain and Ireland, for the preceding year stood, on the 5th of Jan. 1823, as follows:

	£.	s.	d.
Official value of Imports	30,500,094	17	4
Ditto of Exports, viz.			
British and Irish produce and manufactures	44,236,533	2	4
Foreign and Colonial merchandise	9,227,589	6	11
Total Exports	£53,464,122	9	3

This subject is further illustrated by the number of vessels, tonnage, and number of persons employed in carrying on this commerce. It is thus officially stated up to September 30. 1821.

	Vessels.	Tons.	Men.
United Kingdom	21,163	2,329,213	150,424
Guernsey, Jersey, Man, &c.	489	26,639	3,859
Plantations	3,384	204,350	14,896
Total	25,036	2,560,202	169,179

COMMISSION, in Commerce. See FACTORAGE.

COMMISSIONER, is he that has a commission, as letters-patent, or other lawful warrant to execute any public office, as

COMMISSIONERS of the Customs, of Bankrupts, &c. &c.

COMMITTEE, is he, or they, to whom the consideration, or ordering of any matter, is referred or committed, either by some court, or by consent of the parties to whom it belongs. As in a parliament, a bill being read, is either consented to and passed, or denied, or neither, but referred to the consideration of a committee appointed by the house. When a parliament is called, and the speaker and members have taken the oaths, there are committees appointed to sit on certain days, viz. the committee of privileges and elections, of religion, of trade, &c. which are standing committees. Sometimes the whole house resolves itself into a committee, on which occasion each person has a right to speak and

reply as often as he pleases, which is not the case when the house is not in a committee.

COMMODORE, an officer of the British navy, commissioned by the lords of the admiralty, or by an admiral, to command a squadron of men of war in chief. He carries a broad pendant at the main top-mast head, and is the next officer in rank and command to a rear-admiral.

COMPAN, a silver money, current in several parts of India, particularly at Patane: it is worth about nine sols French money, or $4\frac{1}{2}$ d. British, though it rises and falls; and is near the same in value and alloy with the mamoudi of Cambaye.

COMPANY, is a society of merchants, or mechanics, joined together in one common interest. When there are only two or three joined together, it is called a partnership; the term *company* being restrained to societies consisting of a considerable number of members associated together by a charter obtained from the sovereign. The mechanics of all corporations, or towns incorporated, are thus erected into companies, which have chartered privileges and large immunities. Those of London are very numerous. The Mercers were incorporated in the 17th of king Richard II. in the year 1393; the Grocers in the 20th of Edward III. ann. 1345; the Drapers in the 11th of Henry VII. ann. 1430; the Fishmongers in the 28th of Henry VIII. ann. 1536; the Goldsmiths in the 16th of Richard II. ann. 1592; the Skinners in the 1st of Edward III. ann. 1327; the Merchant-Tailors in the 17th of Henry VII. ann. 1501; the Haberdashers in 26 Henry VI. ann. 1447, and 17 Henry VII. ann. 1501; the Salters in the 20th of Henry VIII. ann. 1530; the Ironmongers in the 3d of Edward IV. ann. 1462; the Vintners in the reign of Edward III. and the 15th Hen. VI.; and the Clothiers in the 22d Henry VIII. Besides these, which are the twelve principal companies in London, there are other very considerable ones; as the dyers, brewers, leather-sellers, pewterers, barbers and surgeons, armourers, white bakers, wax-chandlers, cutlers, girdlers, butchers, sadlers, carpenters, cordwainers, painters, curriers, masons, plumbers, innholders, founders, embroiderers, poulterers, cooks, coopers, bricklayers, tylers, bowyers, fletchers, blacksmiths, joiners, plaisterers, weavers, fruiterers, scriveners, bottle-makers, horners, stationers, musicians, lormers, tallow-chandlers, brown bakers, wood-mongers, upholsterers, turners, glaziers, clerks, watermen, apothecaries, throwsters.

The word *company* seems now more particularly appropriated to those grand associations set on foot for the commerce of the remote parts of the world, and vested by charter with peculiar privileges. When

companies do not trade upon a joint stock, but are obliged to admit any person properly qualified, upon paying a certain fine, and agreement to submit to the regulations of the company, each member trading upon his own stock and at his own risk, they are called *regulated companies*. When they trade upon a joint stock, each member sharing in the common profit or loss in proportion to his share in this stock, they are called *joint stock companies*. Such companies, whether regulated, or joint stock, sometimes have, and sometimes have not, exclusive privileges. Regulated companies resemble, in every respect, the corporations of trades so common in cities and towns of all the different countries of Europe; and are a sort of enlarged monopolies of the same kind. As no inhabitant of a town can exercise an incorporated trade, without first obtaining his freedom in the corporation, so in most cases no subject of a state can lawfully carry on any branch of foreign trade, for which a regulated company is established, without first becoming a member of that company. The monopoly is more, or less, strict, according as the terms of admission are more, or less, difficult, and according as the directors of the company have more, or less, authority, or have it more, or less, in their power to confine it to themselves and their particular friends.

The regulated companies of Great Britain for foreign commerce, are the *Hamburgh*, *Russia*, *Eastland*, *Turkey*, and *African Companies*.

The *Hamburgh Company* is the oldest trading company in the kingdom, though not always known by that name, nor restrained to those narrow bounds to which it is now confined. It was first called the company of Merchants trading to Calais, Holland, Zealand, Brabant, and Flanders: then it acquired the general title of Merchant-Adventurers of England, as being composed of all the English merchants who traded to the Low-Countries, the Baltic, and the German Ocean. Lastly, it was called by its present name. This company was first incorporated by Edward I. in 1296, and their privileges have been confirmed by many of his successors. The revolutions which happened in the Low-Countries towards the end of the sixteenth century, and which laid the foundation of the republic of Holland, having hindered the company from continuing their commerce with their ancient freedom, they were obliged to turn it almost wholly to the side of Hamburgh, and the cities on the German Ocean.

The *Russian Company* was first projected towards the end of the reign of king Edward VI. and executed in the first, and second, years of Philip and Mary; but had not its perfection till its charter was confirmed by

act of parliament under queen Elizabeth in 1566. It had its rise from certain adventurers who were sent in three vessels on the discovery of new countries, and to find out a north-east passage to China. These, falling into the White Sea, and putting into the port of Archangel, were exceedingly well received by the Muscovites, and at their return, solicited letters-patent to secure themselves the commerce of Russia, for which they had formed an association. This company subsisted with reputation almost a whole century, till the time of the civil wars. It is said, the Czar then reigning, hearing of the death of Charles I. ordered all the English in his states to be expelled: of which the Dutch taking advantage, settled in their room. After the restoration, the remains of the company re-established part of their commerce at Archangel, but never with the same success as before, the Russians being now well acquainted with the Dutch merchants and merchandise. This company subsists still under the direction of a governor, four consuls, and assistants; and by the 10th and 11th of William III. c. 6. the fine for admission was reduced to 5*l*.

The Eastland Company was incorporated by Queen Elizabeth. Its charter is dated in the year 1579. By the first article, the company is erected into a body politic, under the title of the Company of the Merchants of the East, to consist of Englishmen all real merchants, who have exercised the business thereof, and trafficked through the Sound before the year 1568, into Norway, Sweden, Poland, Livonia, Prussia, Pomerania, &c. excepting Narva, Muscovy, and its dependencies. Most of the remaining articles grant them the usual prerogatives of such companies, as a seal, governor, courts, laws, &c.

The Turkey or Levant Company had its rise under Queen Elizabeth in 1581. James I. confirmed its charter in 1605, adding new privileges. During the civil wars, there happened some innovations in the government of the company, many having been admitted members, not qualified by the charters of Queen Elizabeth and King James, or that did not conform to the regulations prescribed. Charles II., upon his restoration, endeavoured to settle it upon its ancient basis; to which end he gave them a charter, containing not only a confirmation of their old one, but also several new articles of reformation. By this the company is erected into a body politic, capable of making laws, &c. under the title of the Company of Merchants of England trading to the Seas of the Levant. The number of members is not limited, but is ordinarily about 300. The principal qualification required is, that the candidate be a freeman of London, and a wholesale merchant, either

by family or by serving an apprenticeship of seven years.

The Company of Merchants trading to Africa, established in 1750. Contrary to the former practice with regard to regulated companies who were reckoned unfit for such sort of service, this company was subjected to the obligation of maintaining forts and garrisons. It was expressly charged at first with the maintenance of all the British forts and garrisons that lie between Cape Blanc and the Cape of Good Hope; and afterwards that of those only which lie between Cape Rouge and the Cape of Good Hope. The act which establishes this company (the 25d of Geo. II. c. 51.) seems to have had two distinct objects in view; first, to restrain effectually the monopolizing spirit which is natural to the directors of a regulated company; and secondly, to force them, as much as possible, to give an attention, which is not natural to them, towards the maintenance of forts and garrisons. For the first of these purposes the fine for admission is limited to forty shillings. The company is prohibited from trading in their corporate capacity, or upon a joint stock; from borrowing money upon a common seal; or from laying any restraints upon the trade, which may be carried on freely from all places, and by all persons being British subjects, and paying the fine. The government is in a committee of nine persons, who meet in London, but who are chosen annually by the freemen of the company at London, Bristol, and Liverpool; three from each place. No committee-man can be continued in office for more than three years together. Any committee-man might formerly be removed by the board of trade and plantations, now by a committee of council, after having been heard in his defence. The company are forbidden to export negroes from Africa, or to import any African goods into Great Britain; but as they are charged with the maintenance of forts and garrisons, they may for that purpose export from Great Britain to Africa goods and stores of different kinds. Out of the money which they shall receive of the company, they are allowed a sum not exceeding 800*l*. for the salaries of their clerks and agents at London, Liverpool, and Bristol; the house-rent of their offices in London, and all other expenses of management, commission, and agency, in England. What remains of this sum, after defraying those different expenses, they may divide among themselves, as a compensation for their trouble, in what manner they think fit. For the second purpose mentioned, (the maintenance of the forts and garrisons,) an annual sum has been allotted to them by parliament. For the proper application of this sum, the committee is obliged to account annually to the cursor baron of the ex-

chequer, which account is afterwards to be laid before parliament.

Joint Stock Companies, established either by royal charter or by act of parliament, differ in several respects, not only from regulated companies, but from private copartneries. In a private copartnery, no partner, without the consent of the company, can transfer his share to another person, or introduce a new member into the company; each member, however, may, upon proper warning, withdraw from the copartnery, and demand payment of their out of the common stock, of his share. In a joint stock company, on the contrary, no member can demand payment of his share from the company; but each member can, without their consent, transfer his share to another person, and thereby introduce a new member. The value of a share in the joint stock is always the price which it will bring in the market; and this may be either more, or less, in any proportion, than the sum which its owner stands credited for in the stock-book. In a private copartnery, each partner is bound for the debts contracted by the company to the whole extent of his fortune. In a joint stock company, on the contrary, each partner is bound only to the extent of his share. The trade of a joint stock company is always managed by a court of directors. This court, indeed, is frequently subject, in many respects, to the controul of a general court of proprietors; but the greater part of these proprietors seldom pretend to understand any thing of the business of the company, and give themselves no trouble about it, but receive contentedly such half-yearly, or yearly, dividend as the directors think fit to make to them. This total exemption from trouble and risk, beyond a limited sum, encourages many people to become adventurers in joint stock companies, who would upon no account hazard their fortunes in any private copartnery. Such companies, therefore, commonly draw to themselves much greater stocks than any private copartnery can boast of. The principal joint stock companies at present subsisting in Great Britain, are the South Sea, the East India, and the Hudson's Bay Companies.

The South Sea Company. — During the long war with France in the reign of Queen Anne, the payment of the sailors of the royal navy being neglected, they received tickets instead of money, and were frequently obliged by their necessities to sell those tickets at a discount of 40, and sometimes 50 per cent. By this and other means, the debts of the nation unprovided for by parliament, and which amounted to 9,471,321*l.*, fell into the hands of certain monied men, who were afterward incorporated under the title of "The Governor and Company of Merchants of Great Britain

trading to the South Seas, and other parts of America, and for encouraging the fishery, &c." It would be an unprofitable waste of time here to trace a history of alternate avarice, and extravagance, which distinguished this company, till at length, in the year 1722, they petitioned parliament to be allowed to divide their immense stock of more than 33,800,000*l.*, the whole of which had been lent to government in two equal parts; the one half, or upwards of 16,900,000*l.* to be put upon the same footing with other government annuities, and not to be subject to the debts contracted, or losses incurred, by the directors of the company in their mercantile projects; the other half to remain as before, a trading stock, and to be subject to those losses and debts. The petition was too reasonable not to be granted. In 1733, they again petitioned parliament that three-fourths of their trading stock might be turned into annuity stock, and only one-fourth remain as trading stock. Both their annuity and trading stock had by this time been reduced more than 2,000,000*l.* each, by several different payments from government; so that this fourth amounted only to 662,784*l.* 8*s.* 6*d.* In 1748, all the demands of the company upon the King of Spain, in consequence of the Assiento contract, were, by the treaty of Aix-la-Chapelle, given up for what was supposed an equivalent: an end was put to their trade in the Spanish West Indies; the remainder of their trading stock was turned into annuity stock, and the company ceased in every respect to be a trading company. This company is governed by a governor, sub-governor, deputy governor, and 21 directors: but no person is qualified to be a governor, his majesty excepted, unless such governor has in his own name and right 5000*l.* in the trading stock; the sub-governor is to have 4000*l.*; the deputy-governor 3000*l.*; and a director 3000*l.* in the said stock. In every general court, every member having in his own name and right 500*l.* in trading stock, has one vote; if 2000*l.* two votes; if 3000*l.* three votes; and if 5000*l.* four votes.

EAST-INDIA COMPANY, a corporation styled by 6 Ann. c. 17. s. 13. "*The United Company of Merchants of England trading to the East Indies*;" that is, according to the 9 & 10 Will. 3. c. 44. s. 61. trading "in, to, and from, the East Indies in the countries and parts of Asia and Africa, and in, to, and from, the islands, ports, havens, cities, creeks, towns, and places of Asia, Africa, and America, or any of them beyond the Cape of Good Hope to the Straights of Magellan, where any trade or traffic of merchandize is, or may be, used or had, and to, and from, every of them.

After the discovery of the passage by sea to the peninsula of India, at about the close of the 15th century, several attempts were

made by private individuals to open a trade in that part of the world : but these proving unsuccessful, Q. Eliz. by a charter, dated Dec. 31. 1600, established an incorporated company, under the name of "*The London East India Company.*"

This company on an accidental failure in the payment of a small duty imposed on their capital stock (4 & 5 W. & M. c. 15. s. 10. 12.) forfeited their charter : but afterwards, in the same year, the crown revived their powers and exclusive privileges by a new charter. However, by stat. 9 & 10 W. 3. c. 44. two new companies were established, and the subscribers to a loan of 2,000,000*l.* for carrying on the then war, were incorporated into a *general society*, with liberty for each individual member to trade to India within the exclusive limits of the said company to the extent of his share of this loan, and power was granted to such of the subscribers as should choose to convert their subscriptions into a joint stock, to do so, and they were to be incorporated by a separate charter, by the name of "*The English East-India Company.*"

The old company, to whose prejudice these two new corporations were to be erected, became subscribers for a very large proportion of the loan of two millions, and united with the English company in 1702, which union was afterwards confirmed by parliament, by stat. 6 Ann. c. 17. and the separate traders of the *general society*, whose subscription to the loan amounted to only 2700*l.* at the time of the union, soon afterwards joined the united company.

This is a brief account of the rise and progressive establishment of the present East-India Company.

In the year 1708, the interest, which then stood at eight per cent. upon the two millions thus advanced to government, was reduced to five per cent. At the time that this interest was reduced, the company granted a new loan of 1,200,000*l.* to the public, without any additional interest; and, in consideration thereof, they obtained from parliament a prolongation of its extensive privileges for a limited period; and a new charter was granted, incorporating it under the title of "*The United Company of Merchants trading to the East Indies.*" This exclusive right of trade was afterwards prolonged from time to time, upon its making new loans to government; and although in the year 1750 the company's exclusive privileges were extended to 33 years, yet the interest of their capital, then amounting to 3,190,000*l.* was reduced to three per cent., and is known by the name of the "*India three per cent. annuities.*" It may be here observed, that these annuities are different in their nature from the trading stock of the company. The proprietors of the company's stock, instead of receiving a regular annuity, have dividends paid them

upon their respective shares of stock, according to the profits of the company's trade; and these dividends rise, or fall, conformably to circumstances, real, or fictitious, like the national funds.

Further than this it is unnecessary to expatiate upon the succession of regulations for the government of this great and powerful company, till we come to the most recent statutes for their government.

In 1773, the situation of India was largely discussed in the parliament of Great Britain, and certain general regulations affecting the whole of the company's territorial, judicial, and commercial concerns, were enacted. Troubles, however, broke out, and were followed by commercial distresses; and after a lapse of ten years, new provisions were submitted to parliament by two successive administrations for the government of India. Under the latter of these, commonly known by the name of "*Mr. Pitt's bill,*" as the former was by that of "*Mr. Fox's,*" the affairs of the India company, both at home and abroad, have been governed till very lately, when a new system has been adopted, on which it is unnecessary to dilate, as it will be best collected from the following extract of "*An Act for continuing to the India Company, for a further term, the possession of the British territories in India, together with certain exclusive privileges, &c.*"

By 53 Geo. 3. c. 155. the charter of the India Company is further continued from 10th day of April, 1814, till the expiration of three years' notice after the 10th day of April in the year 1831, together with the payment of what may be due from the public to the Company. During the period hereby granted, the Company are to continue the exclusive trade to China, and the territorial acquisitions in Asia mentioned in the statute of 53 of Geo. 3., with such other acquisitions as they may since then have obtained on the continent of Asia, or on any islands situate to the north of the equator, with the revenues thereof respectively. Sect. 1, 2, 3.

But thenceforth any of his majesty's subjects may trade to and from the United Kingdom, from and to the ports and places within the Company's present limits (except China) in ships navigated according to law.

And the navigation act of 12 Car. 2. c. 18. shall not prevent the importation of goods, the produce of any place within the charter, except tea, from any other place within the charter, except China. Sect. 6, 7.

But it shall not be lawful for any person, without the special licence of the Company given in writing, to trade in tea from any place in India; nor to export to any place on the continent of Asia, between the river Indus and the town of Malacca, or to any island under the government of the said Company

north of the equator, nor to their factory of Bencoolen and its dependencies, any military stores. Sect. 8, 9.

All ships in the private trade must clear out from some port in the United Kingdom; and all goods imported in the private trade must be brought to some of the ports in the United Kingdom which shall have been declared fit by an order in council. And no ships in the private trade shall proceed to any place within the limits before mentioned, except to some one of the principal settlements there, without a special licence from the directors, subject to the controul of the board of commissioners; who, if they differ from the directors, shall record their reasons. Sect. 10, 11.

No ships, except packets under 350 tons, to clear out, or be admitted to entry, at any place within the limits of the Company's charter. Sect. 13.

No ship in private trade to clear out, or enter, without a manifest; nor without giving an attested list of persons and arms, and accounting for them. Sect. 14, 15.

Articles of silk, hair, and cotton wool, imported, not to be entered, or taken out of warehouses, except for exportation, unless brought to the port of London and secured in the Company's warehouses; which articles shall be publicly sold to ascertain the duties. But the commissioners of his majesty's treasury may authorise such articles, when brought to out-ports, to be removed to the port of London to be sold for home consumption. And all such articles, when entered and taken out of warehouses, to be charged *ad valorem*. Sect. 17, 18, 19.

Goods exported or imported by the Company to be subject to the same duties, as those exported, or imported, in the private trade. And no duties imposed in India shall be valid till sanctioned by the directors, and approved by the board of controul. Sect. 24, 25.

The rates and duties due to the India Dock Company by statutes 43 Geo. 3. and 46 Geo. 3. on all goods, &c. cleared and discharged from ships, confirmed, &c. by sect. 28, 29.

The revenues arising from the territorial acquisitions in India, are directed to be applied as follows:

1st. In maintaining the forces, European as well as native, forts, garrisons, and establishments both naval and military.

2dly. In payment of the interest of debts accruing, owing, or thereafter to be incurred in India.

3dly. In defraying the expenses of the establishments of the several settlements in India.

4thly. In liquidating the territorial debts, and bond debts at home, of the said company. Sect. 55.

The profits of the company in Great Britain to be applied as follows:

1st. In paying bills of exchange accepted or to be accepted by the company.

2dly. In paying other debts and commercial outgoings (the principal of the bond debt excepted).

3dly. In the payment of a dividend of 10 per cent. on the present stock of the company; and from the time of that fund being exhausted, then 10½ per cent. on the future stock of the said company.

4thly. In reduction of the Indian debts, or bond debt at home. Sect. 57.

The home profits not to be liable generally to territorial charges till after the dividend shall have been provided for; and every deficiency of commercial profit at home in any year for dividend, to be made good out of surplus territorial revenues. Sect. 58.

And after reduction of the debt of the company bearing interest in India to ten millions of pounds, and the bonded debt in Great Britain to three millions, the surplus proceeds from territorial revenues and home profits shall go in repayment of capital of public funds created for the company: any further surplus to be paid into the exchequer, to be a guarantee fund, not exceeding twelve millions, for the capital stock and dividends, at the rate of 10l. 10s. per cent. One-sixth of any excess above twelve millions to belong to the company, the other five-sixths to the public, at the disposal of parliament. Sect. 59.

The three several statutes of 39 Geo. 3. c. 89., 50 Geo. 3. c. 86., and 51 Geo. 3. c. 75., regulated the manner in which the East India Company should be enabled to hire and take up ships by private contract. The 58 Geo. 3. c. 83. recites that these several acts were made in time of war, and that therefore the calculations on which the contracts were then made must, since the return of peace, be greatly erroneous; it therefore repeals the said statutes, and enacts that the company shall thenceforward not have, or contract for, any ships for their service, except in the manner thereby directed; which shall be by giving notice of their occasions to contract by public advertisement, stating the burdens of the ships wanted, the dimensions of timbers and planks, number of guns, manner of building, providing, furnishing, and storing; the time to be allowed for building, and other particulars necessary for judging of the expense and freight thereof; and the time, not less than four weeks, shall be fixed for receiving proposals for the same sealed up, &c.; the lowest of which offered shall be accepted, &c. And after the expiration of the time contracted for, may again be engaged for a limited number of voyages. Sect. 1, 2, 3.

Tables of prices of building and outfit of ships to be hung up in the India House. Sect. 5.

Court of directors, in cases of exigency, may hire ready built ships, with, or even without, advertisement; and also may hire by private contract any ships engaged in the transport service, for the purpose of bringing cargoes from China or India; provided the measurement of said ships be according to the regulations prescribed by stat. 53 Geo. 3. c.155. sect. 7, 8, 9. 11.

These provisions not to extend to vessels belonging to war marine establishment in India, nor to the consignment of any goods in private to any ships not chartered to, or in the service of, the India Company. Sect. 14.

Nothing remains to be noticed under this division of our subject, except that the net surplus revenue of our Indian possessions in 1815, after all disbursements, was estimated at 1,342,273*l*.

Thus much is all that has been thought necessary respecting what may be denominated the legislative, the territorial, and the politico-commercial concerns of the India Company. A very brief account of the internal arrangements, so far as they are required for the information of those who may wish to become proprietors of their stock, or to be acquainted with the domestic transaction of their business, shall close this tedious article.

A proprietor of stock to the amount of 1000*l*., whether male or female, native or foreigner, has a right to be a manager, and to give a vote in the general council; 2000*l*. is a qualification for a director. The directors are twenty-four in number, including the chairman and deputy chairman, who may be re-elected in turn. There are six directors annually chosen, in place of six who go out by rotation, and remain in office for four years successively. The chairman and deputy chairman have each a salary of 500*l*. a year, and each of the other directors has a salary of 300*l*. The meetings of the court of directors are to be held once a week least; but they are oftener summoned if occasion require it. There are several committees formed of these directors, and each committee has the superintendency of the various branches of the company's business and concerns.

The several committees are as follow:

1. House committee
2. Committee of correspondence
3. Ditto of buying
4. Ditto of treasury
5. Ditto of warehouse.
6. Ditto of shipping
7. Ditto of accounts
8. Ditto of law-suits
9. Ditto to prevent the growth of private trade.

Each of these committees has under it a secretary, a cashier, clerks, and warehouse-keepers.

The commerce of the company has, not

only from the prohibitions, and privileges, imposed upon it, or extended to it, by the authority of the legislature at different periods; but also by the fluctuations of commerce, independent of extraneous causes, but merely from the effects of taste, fashion, invention, and a thousand other causes uncontrollable by any positive enactment of laws, undergone great changes as to the articles of which it consists.

The exports are chiefly woollen-cloth, stationery, books, hardware, cutlery, assortments of all sorts of works of taste; together with great quantities of bullion, lead, clocks, and watches.

Our imports consist of tea, spices, raw silk, sugar, muslins, calicoes, nankins, cotton, indigo; china, which was formerly a great article, but now to a small amount; diamonds, pearls, and precious stones. See title ASIA.

When goods are received in the private trade warehouses, they are brought to sale with all possible dispatch. In these warehouses an even beam is never admitted; but in such cases, *one pound weight* is always added to the tare; and on all packages taring *one quarter of a cwt.* or upwards, *one pound super tare* is allowed.

In those goods which, for their better preservation, have an interior packing, as *cassia lignea, cinnabar, aloes, &c.* a proportionate allowance is always made.

Upon packages weighing *one quarter of a cwt. gross*, a two-ounce weight is placed in the scale by way of giving a turn in favour of the trade; *one pound* is also allowed for draught on goods of the above weight; and in case of an even beam, *one pound* is also deducted.

On all articles sold by the pound, there is a further allowance of *tret*, or four pounds for every 104, which consists chiefly in the following articles: viz *annotto, Carmentia wool, cotton wool, cotton yarn, cardamoms, cloves, cubebs, cinnabar, indigo, mace, nutmegs, opium, quicksilver, rhubarb, senna, tortoise-shells, and white copper.*

Weighable goods of a different description are sold by the cwt.

Regulations in the Bengal Trade.

On all weighable goods, *no weight* is made use of less than a pound, a two-ounce weight excepted, which is always kept in the scale where the weight is placed.

On all weighable goods (raw silk excepted), *one pound* is allowed for draught on every package that weighs more than 28lbs. gross, and on every draught of goods, not in packages, exceeding 28lbs.

Weighable goods sold by the pound, except raw silk, have an allowance for *tret*, after the rate of 4lbs. for every 104lbs.

Where some of the packages only of any parcel of goods are *tared*, if, on averaging the whole there should be a fraction, it is

made up a pound by adding the fraction wanting.

On all weighable goods (tea and coffee excepted), one pound is allowed for *super tare*; on all packages that *tare* 28lbs. and upwards, and where the *tare* is taken on an average, and there should be a fraction, one pound and the fraction.

Allowances.

Quarter Chest.—If, on averaging those tared, they turn out even pounds, unless the chests weigh gross 84lbs. or upwards, no allowance is made; in which case, one pound *super tare* is allowed on each package.

Half Chests.—If, on averaging those tared, it turns out even, one pound only is allowed for *super tare* on each package; but where there is a fraction, one pound, and such fraction as above.

Whole Chests.—If the average of those tared should turn out even, two pounds are allowed on each package for *super tare*; but if there be a fraction, one pound, and the fraction as above.

Coffee.—If, on averaging the bales tared, it turns out even, two pounds are allowed on each for *super tare*; but if there be a fraction, two pounds and the fraction, as in the preceding articles.

The following Goods are sold at the Company's Sales by the cwt.

Aloes, benjamin, borax, camphor, cassia, cambogium, china root, coffee, cubebs, elephants' teeth, fossil alkali, gallanga root, galls, ginger, gum arabic, gum tragacanth, gum unrated, hemp and flax, long pepper, mother-of-pearl shells, munct, myrrh, olibanum, red-wood, rice, saltpetre, sapanwood, sago, sal ammoniac, seedlac, shellac, sticklac, turmeric, vegetable alkali, wax.

Articles sold at the Company's Sales by the Pound.

Cardamoms, Carmentia-wool, cinnabar, cinnamon, cloves, cotton yarn, cotton thread, cotton wool, indigo, mace, nutmegs, opium, pepper, quicksilver, raw silk, rhubarb, tea.

East-India Piece Goods.

These, consisting of white calicoes, white, plain, checked, or flowered muslins, and white or yellow nankin cloth; muslins, cosacks, and other sorts rated as muslins, receive 10l. per cent. drawback in full of every allowance.

Calicoes three-fourths yard wide, and up to one one-fourth, are entitled to 6d. per yard drawback, in manner following:

Each 10 yards is called a calico, and receives 5s. drawback.

Each ditto, from one one-half yard wide and upwards, upon each six yards (exclusive of 14 one-half per cent. from the original price,) 5s. ditto.

Diaper and dimity draws per yard, exclusive of 14 per cent. as above, 1s. 5d. ditto.

Brokers' Charges.

Piece-goods, purchased of the East-India company, one-fourth to one-half per cent. to be paid by the buyer.

Goods managed for proprietors in privileged private trade, &c. one-fourth to one-half per cent. to be paid by the employer.

For all piece-goods bought in other public sales, one-half per cent. to be paid by the buyer.

Ditto by private contract, one-half per cent. by the seller, unless otherwise agreed.

Valuation of piece-goods, one-fourth per cent.

HUDSON'S BAY COMPANY. The vast countries which surround Hudson's Bay abound with animals whose furs and skins are excellent, being far superior in quality to those found in less northerly regions.

In 1670 a charter was granted to a company not consisting of above ten persons, for the exclusive trade to this Bay; and it has been acted under ever since with great benefit to the company and the country in general. They have several forts, viz. Prince of Wales's, Churchill river, Nelson, New Severn, and Albany, which stand on the west side of the bay, and are garrisoned by 186 men. The French, in May 1782, took and destroyed these forts and the settlements, &c. valued at 5,000,000l. They are said to export commodities to the value of 16,000l.; and to bring home returns to the value of 29,540l. This includes the fishery in Hudson's Bay. This commerce, small as it is, affords immense profits to Great Britain in general; for, the commodities we exchange with the Indians for their skins and furs, are all manufactured in Britain; and as the Indians are not very nice in their choice, such things are sent as would find no other market. On the other hand, the skins and furs we bring from Hudson's Bay enter largely into our manufactures, and afford us materials for trading with many nations of Europe to great advantage. This company do not find their trade so beneficial now as it was before we got possession of Canada. The only attempt made to trade with Labrador has been directed towards the fishery. See further, title EUROPE, article LONDON.

COMPASS, (GER. *Ein Kompass*. DU. *Zee-kompas*. DA. *Søekompass*. SW. *Sjökompass*. FR. *Boussole*, *Compas de mer*. IT. *Bussola*. SP. *Aguja de marear*. PORT. *Compasso de marear*. RUS. *Kompass korabelniui*.) or mariner's compass, an instrument composed of a needle and card, by which the ship's course is directed. The needle, with little variation, always points towards the north, and hence the mode of steering by the compass. The origin of this invention is buried in the darkness of antiquity, but the honour of it is generally given to the Chinese, long before the Christian era.

COMPASSES, (GER. *Ein Zirkel*, *Pas-ser*. DU. and DA. *Cirkel*, *Passer*. SW. *Cirkel*, *Passare*. FR. *Compas*. IT. *Compasso*. SP. *Compas*. PORT. *Compasso*. RUSS. *Zirkul*.) A pair of compasses, is a mathematical instrument for describing circles, or measuring lines. It is made of iron, brass, or other metal, and is used by almost all mechanics in their respective operations. Draughtsmen of all descriptions, carpenters, and masons, depend on compasses for the correctness of their operations: the companies, or fraternities, of the two last-mentioned trades take the compasses as a distinguishing feature in their armorial bearings.

COMPOSITION, is a term of such diversified and multifarious signification, according to the subject to which it is applied, that it becomes impracticable to give any exposition of it here, beyond what bears a direct and immediate reference to trade and its correlative pursuits. In commercial language, it generally is used to signify a contract between an insolvent debtor and his creditors, by which the latter accept of a part of the debt in compensation for the whole, and give a general acquittance accordingly.

COMPOSITION, in printing, commonly called composing, the arranging of several types or letters, in the composing-stick, in order to form a line; and of several lines ranged in order in the galley, to make a page; and of several pages to make a form. See PRINTING.

COMPOUND, *to*, in commerce. See COMPOSITION.

COMPROMISE, is a mutual promise of two or more parties at difference, to refer the ending of their controversies to arbitration of indifferent persons, and to abide their award.

COND, CONN, or CON, in sea language, signifies to guide or direct the ship to her right course, by giving directions to the man at the helm how to steer.

CONDERS, a term used in the herring-fishery, for people who stand on cliffs or eminences near the sea-coast, to direct the fishermen which way the shoal of herrings passes; their course being more conspicuous to those who stand on high cliffs ashore, than to those on board the vessels.

CONDORIN, a sort of small weight at Canton in China, used for weighing silver received and paid in trade, value about three farthings sterling, ten of them making one mace, and ten maces one tale or tael.

CONDURI, in Malayan, or *laga* in the Javan language, is a scarlet bean with a black spot on its side, which the people of Malay and Java use for weighing gold and silver.

CONEY-WOOL, (GER. *Kaninchenwolle*. DU. *Konynhaair*. DA. *Kaninhaar*. SW. *Kaninhar*. FR. *Poil de lapin*. IT. *Pelo di Coniglio*. SP. *Conejuna*. PORT. *Lã de coelho*.

RUSS. *Krolikowia Koshi*. POL. *Kroliki*. LAT. *Cuniculi lana*,) rabbits' fur, principally used by hatters, &c. of which large quantities are imported annually from various parts of the world. Since the general inclosure of our commons and heaths, we depend in an increased degree upon importation for this commodity.

CONGER, the sea-eel.

CONGIUS, a liquid measure of the ancient Romans, containing the eighth part of the amphora, or the fourth of the urna, or six sextarii. The congius, in English measure, contains 20.70676 solid inches; that is, seven pints, 4.942 solid inches.

CONODIS, a small coin used at Goa, and in all the kingdom of Cochin.

CONSCIENCE, *courts of*. These were courts originally instituted by act of parliament, in London and Westminster, and other trading and populous districts, for the recovering of small debts not exceeding 40s. but many of them have now an extended jurisdiction for the recovery of small debts to the amount of 5*l*. as by 39 & 40 G. 3. c. civ. as to London, and 46 G. 3. c. lxxvii. and c. lxxxviii. as to Southwark and the west hundred of Brixton.

And by 26 Geo. 3. c. 38. debtors committed by courts of conscience for debts not exceeding 20*s*. shall not be imprisoned more than 20 days, and where the debt does not exceed 40*s*. not more than forty days, which prisoners are to be discharged without gaol fees, and gaolers demanding or taking the same are to forfeit 5*l*. on conviction, before two justices within two months; and the process of courts of conscience shall not issue against both body and goods at the same time.

CONSIDERATION, is the material cause of a contract, without which it would not be effectual or binding. Consideration in contracts is something given in exchange, something that is mutual and reciprocal; as money given for goods sold, or work performed for wages; and a consideration of some sort or other is so absolutely necessary to the forming of a contract, that a *nudum pactum*, or agreement to do or pay any thing on one side, without any compensation on the other, is totally void in law, and a man cannot be compelled to perform it. 2 *Black*. 45. A consideration is necessary to create a debt, otherwise it is a *nudum pactum*. *Jenk*, 290. in *Pl*. 27.

CONSIGNMENT, the sending, or delivering over, goods, money, or other property to another person. It may be either consigned unconditionally, or for some particular purpose. Consigned goods are supposed in general to be the property of him by whom they are consigned, (who is called the *Consignor*.) but to be at the disposal of him to whom they are consigned, (who is called the *Consignee*).

CONSPIRACY, is an agreement of two

or more persons falsely to indict one, or to procure him to be indicted of felony, riot, or other misdemeanor; or to do some other injury to a third person, or to the public in general.

On an indictment for a conspiracy, if all the defendants but one are acquitted, that one must be acquitted also; because one person alone cannot be indicted for this crime; and husband and wife being but one person may not be indicted for a conspiracy, unless it be laid or proved that they conspired with others unknown. 4 *Black. Com.* 136.

CONSUL, is an officer established by virtue of a commission from the king and other princes, in all foreign countries of any considerable trade, to facilitate and dispatch business, and to protect the merchants of the nation. The consuls are to maintain a correspondence with the ministers of England residing in the courts whereon their consulate depends. They are to support the commerce and the interest of the nation, to dispose of the sums given, and the presents made to the lords and principals of places to obtain their protection, and prevent the insults of the natives on the merchants of their nation. By the treaty of Utrecht, between Great Britain and Spain, the consul residing in the king of Spain's dominions shall take inventories of the estates of the English dying intestate in Spain; and these estates shall be intrusted to two or three merchants, for the security and benefit of the heirs and creditors.

The statute of 9 Geo. 2. enacts, that it shall be lawful for persons appointed by the consuls at the ports of Cadiz and St. Mary's in Spain, with the majority of the British factory and merchants there, to receive from all English and Irish ships trading there, any sums of money not exceeding one rial of plate per ducat of the freight of goods and merchandise there imported, and on all tonnage goods not exceeding 2 rials of plate per ton, and all their bills of lading shall specify to pay the same under the denomination of contribution. And all British and Irish commanders trading to the said ports, and delivering there, shall, within ten days after their arrival, deliver a manifesto upon oath, specifying the particulars of the cargo, and to whom consigned; which oath is to be administered by the consul, or whom he shall appoint, and the clearances outwards detained by him till payment of the money is made; and any departing without his clearances, the consul, on such master's return to any port in the king's dominions, may have an action at law against him for the said money. All monies raised to be applied to the relief of shipwrecked mariners, or other distressed persons, his majesty's subjects, and charitable uses, are distributed by the consul.

CONTENT, in geometry, the area or quantity of matter or space included in certain bounds. For example, the *content* of a ten of round timber is 43 solid feet. See **GAUGING**.

CONTRABAND, a prohibited commodity or merchandise bought or sold, imported or exported, in prejudice to the laws and ordinances of a state, or the public prohibitions of the sovereign. Contraband goods are not only liable to confiscation themselves, but also subject to a similar penalty, all other merchandise found with them in the same box, bale, or parcel, together with the horses, waggons, &c. which conduct them.

There are contrabands likewise, which, besides the forfeiture of the goods, are attended with several penalties and disabilities.

What shall, or shall not, be deemed contraband, depends on regulations which are fluctuating, according to the commercial relations between states; and the extent of punishment or forfeiture annexed to the offence of dealing in them respectively can only be collected by a reference to the statutes which prohibit the respective commodities. See further, title **SMUGGLING**.

CONTRACT, a covenant or agreement between two or more persons, with a lawful consideration or cause. Contracts are twofold, either express or implied. Express contracts are, where the terms of the agreement are openly uttered, as to pay a stated price for certain goods. Implied, are such as reason and justice dictate, and which, therefore, the law presumes that every man undertakes to perform: thus, if a man takes up goods and wares from a tradesman, without any agreement of price, the law concludes that he contracted to pay their real value. 2 *Black.* 449.

And by the statute of frauds, 29 Car. 2. c. 3. "all contracts, not to be performed in a year, are to be in writing, signed by the party, or no action may be brought on them." However, if no day is set, or the time is uncertain, they may be good without it. And by the same statute, "no contract for the sale of goods for 10*l.* or upwards shall be good, unless the buyer receive part of the goods sold; or gives something in earnest to bind the contract; or some note thereof be made in writing, signed by the person charged with the contract, &c. See **AGREEMENT**, and **CONSIDERATION**.

CONTRACT, *usurious*, is an agreement to pay more interest for money than the laws allow. See **USURY**.

It is a *devastavit* in executors to pay a debt upon an usurious contract.

CONTRATE-WHEEL, in watch-work, that next to the crown, the teeth, and hoop, of which lie contrary to those of the other wheels, whence it takes its name.

CONTRAYERVA, or **COUNTER-POISON**, (GER. *Amerikanische oder Peruanische Giftwurzel*. DU. *Gifwortel*. DA. *Gifrod*. SW. *Giftrot*. FR. *Contrayerva*. IT. *Contra-erba*. ŠP. *Contra-yerba*. PORT. *Contra-erva*. LAT. *Contrayerva*.) is a root an inch or two long, about half an inch thick, full of knots, hard, and of a reddish colour. Long, tough slender fibres shoot out from all sides of it: these are sometimes loaded with knotty excrescences. The root is of a pale colour within, of an astringent taste, bitterish, with a light and sweetish kind of acrimony, and has a peculiar kind of aromatic smell. The fibrous part of the root has very little smell or taste: the tuberous therefore should only be chosen. It was formerly much used in medicine from its supposed virtues as an antidote to poisons; but it is now deservedly neglected.

CONTRIBUTION. See **AVERAGE**, **SALVAGE**, and **INSURANCE**.

CONVEX, an appellation given to the exterior surface of gibbous or globular bodies; in opposition to the hollow inner surface of such bodies, which is called concave: thus we say, a convex lens, mirror, &c.

CONVEYANCE, in law, a deed which passes land from one to another. Fraudulent conveyance to deceive creditors, defraud purchasers, &c. are void by divers statutes.

CONVEYANCER, is one who draws the deeds by which estates are conveyed. It is a particular branch of the legal profession, though sometimes exercised in conjunction with others. Conveyancers are so recognised by 55 Geo. 3. c. 184. which subjects them to an annual duty.

CONVOY, one or more ships of war, employed to accompany and protect merchant-ships, and prevent their being insulted by pirates, or the enemies of the state in time of war. Captains, officers, and seamen of ships appointed for convoy of merchant-ships, &c. neglecting their duty, are punishable by act of 13 Car. 2. stat. 1. c. 9. s. 1. art. 15.

COOMB, or *comb of corn*, a dry measure, containing four bushels, or half a quarter.

COOPER, one who manufactures casks, tubs of all sizes, pails, and other similar articles used by brewers, dealers in liquors, and for domestic purposes. The vessels are made generally of oak timber, a great part of which comes from America, cut up into narrow pieces or staves; they are sometimes bent, and sometimes straight, according to the purposes for which they are wanted. The staves are kept together by means of hoops made from hazel or ash, or of iron. To make them hold water, or other liquids, split flags are inserted, which swell by moisture, and effectually prevent the vessels from leaking. The coopers in London, and other maritime

places, derive large profits, and almost constant employment, from the West India trade. The puncheons and hogsheds which they make are used for packing the coarse goods sent to the islands, whence those vessels return filled with rum and sugar.

Coopers, by 23 Hen. VIII. c. 4. shall make their vessels of seasonable wood; and make them with their own marks, on forfeiture of 3s. 4d.; and the contents of vessels are appointed to be observed under a like penalty.

COPAL, a substance of great importance as a varnish, obtained from the *rhus copalinum*, a tree in North America. It is a beautiful transparent resinous-like substance. When heated it melts like other resins; but it differs from them in not being soluble in alcohol, or in oil of turpentine, without peculiar management. Neither does it dissolve in the fixed oils, like other resins. The specific gravity of copal varies from 1.045 to 1.159.

COPARTNERSHIP, is the state of merchants, or others, carrying on a joint trade, &c. See **PARTNER**.

COPE, among miners, a duty of 6d. for every log of ore.

COPING, or *copping of a wall*, in architecture, the top or covert of a wall, made sloping to carry off the wet.

COPPER, (GER. *Kupfer*. DU. *Koper*. DA. *Kobber*. SW. *Koppar*. FR. *Cuivre*. IT. *Rame*. SP. *Cobre*. PORT. *Cobre*. RUS. *Mjed*, *Krasnoi mjed*. POL. *Miedz*. LAT. *Cuprum*.) a metal, next to iron in specific gravity, but lighter than gold, silver, or lead. This metal is of a fine red colour, and has a great deal of brilliancy. Its taste is styptic and nauseous; and the hands, when rubbed for some time on it, acquire a peculiar and disagreeable odour. Its specific gravity, when melted, is 8.667. Its malleability is great; it may be hammered out into leaves so thin as to be blown about by the slightest breeze. Its ductility is also considerable. Its tenacity is such, that a copper wire 0.078 in diameter, is capable of supporting 302.26 pounds avoirdupois without breaking. In Germany and Sweden, there are very good mines of copper ore; and we have some in England, particularly in Cornwall and in Wales, not inferior to the finest Swedish. As to the method of obtaining copper from the ore, this last being previously washed and powdered, is smelted by means of a black flux; and the metal is found at the bottom of the vessel, when cold, in the form of a solid and malleable mass, which may be farther refined by repeating the operation.

Copper is usually employed in the manufacture of boilers, stills, pots, pans; and forms the substance of those ornamental chains which afterwards are gilt.

From its sonorous property when struck,

it is employed for making trumpets, bells, &c. and from its beautiful and brilliant colour, and not readily becoming oxidized, it is used for the manufacture of culinary vessels; but they should be kept very clean, and not used for containing acid substances; fat bodies also, when allowed to cool in them, quickly oxidize the metal, and form a compound highly deleterious to the animal economy. With acetic acid, it forms *verdigris*; and with sulphuric acid, *Roman*, or *blue vitriol*. By the addition of chalk to a solution of copper in nitric acid, a precipitate is formed of a beautiful blue colour, called *blue verditer*. Arseniate of pot-ash added to a solution of sulphate of copper, forms the fine green colour called *Scheele's green*. Ammonia, added to the same solution, produces a precipitate of a deep violet colour. The above are all of considerable use to paper-stainers and painters.

The alloys of copper, with various other metals, are much employed for domestic purposes. Brass is a combination of copper and zinc; for this purpose the native oxide, termed *calamine*, is employed. Tombac, or white copper, is an alloy of arsenic, copper, and tin. Pinchbeck is made by alloying copper or brass with a certain portion of metallic zinc. Bronze and gun-metal by the union of copper and tin in the proportions of 100 parts of the former to 10 or 12 of the latter. Bell-metal is a combination of copper with one-fourth of its weight of tin.

Fowling-pieces and tea-urns are browned by washing them with a solution of sulphate of copper.

COPPERAS, (GER. *Grüner Vitriol*, *Elsvitriol*, *Kupferwasser*. DU. *Groene vitriool*, *Yservitriool*, *Koperrood*, *Koperwater*. DA. *Gron vitriol*, *Jernvitriol*, *Engelskt vitriol*, *Grönt Kobber*. SW. *Grön vitriol*, *Jernvitriol*. FR. *Vitriol verd*, *marial ou couperose*. *Vitriol de fer*, *couperose verte*. IT. *Vitriuolo di marte*. SR. *Vitriolo de marte*. PORT. *Vitriolo de marte*. RUS. *Selenui Kuparos*. POL. *Koperwas zelaza*. LAT. *Vitriolum martis s. viride*.) a name given to the sulphate of green vitriol. Copperas is used in dyeing wool and hats black; in making ink, tanning leather, and in preparing a kind of Spanish brown for painters' use.

COPPER-PLATES, (GER. *Kupferplatten*. DU. *Koperplaat*. DA. *Kobberplader*. SW. *Kopperplatar*. FR. *Planches de cuivre*. IT. *Piastre di rame*. SP. *Laminas ó planchas de cobre*. PORT. *Chapas s. pastas de cobre*.) a plate or piece of copper used by engravers. When the plate is ready to be worked off, the copper-plate printer rubs a kind of ink, made of lamp-black and oil, all over it, and placing it upon a grate over a small charcoal fire, works the ink in a moment into the smallest strokes of the graver. The ink on the surface of the plate is then lightly wiped off with a rag; and the workman, touching

the palm of his hand with a little whiting, with a slight stroke cleans the surface of the plate, while all the ink continues in the lines made by the graver. It is then placed upon the press, where a board slides between two rollers, and a piece of paper well wetted being laid upon the plate, it is brought under the upper roller, which, pressing a piece of flannel upon the moistened paper, makes the latter sink into the smallest scratches made on the plate, and takes off the whole impression by imbibing the ink. See ENGRAVING.

COPYRIGHT, was by the common law of England, a perpetual and inviolable right vested in the author of any literary composition. But the enjoyment of this right has been abridged by the statute of Queen Anne, and all remedy for the violation of it is now taken away by that statute, after the expiration of the two several terms specified in the act. 4 Burr. 2303.

By this stat. 8 Ann. c. 19. (amended by 15 Geo. 3. c. 53.) it is now declared that the author and his assigns shall have the sole liberty of printing and reprinting his works for the term of 14 years and no longer, and hath also protected that property by additional penalties and forfeitures, (see BOOKS) directing further, that if, at the end of that time, the author himself be living, the right shall then return to him for another term of the same duration.

And by 41 Geo. 3. (U. K.) c. 107. in consequence of the Irish union, provisions similar to those in the stat. of Queen Anne, are re-enacted and extended to the whole of the United Kingdom.

Where an author transfers all his right or interest in his publication, upon his surviving the first fourteen years, the second term will result to his assignee, and not to himself. 2 Bro. 80.; and musical compositions are within the meaning and protection of the stat. *Cowp.* 623.

A fair and bona fide abridgment of any book is considered a new work; and however it may injure the sale of the original, yet it is not deemed in law to be a piracy or a violation of the author's copyright. 1 Bro. 451. 2 Atk. 141. See title BOOKS, and ENGRAVINGS.

CORAL fishery. (Coral. GER. *Korallen*. DU. *Koraaalen*. DA. and SW. *Koraller*. FR. *Corail*. IT. *Corale*. SP. and PORT. *Coral*. RUS. *Koralli*. POL. *Koralki*, *Koralii*. LAT. *Corallium*.) Red coral is found in the Mediterranean, on the shores of Provence, from Cape de la Couronne to that of St. Tropez; about the isles of Majorca and Minorca; on the south of Sicily; on the coasts of Africa; and, lastly, in the Ethiopic Ocean, about Cape Negro. The divers say, that the little branches are found only in the caverns, whose situation is parallel to the earth's surface, and open to the south.

Coral is principally used in making beads

for necklaces, and other ornamental parts of females' attire.

CORD of wood, a certain quantity of wood for burning, so called, because formerly measured with a cord. The dimensions of a statute cord of wood are eight feet long, four feet high, and four feet broad.

CORDAGE, (GER. *Tauwerk*. DU. *Touwwerk*. DA. *Tougværk*. SW. *Tagverk*. FR. *Manœuvres*, *Cordage*. IT. *Caolame*. SP. *Jarcia*, *Cordaje*. PORT. *Caolame*, *Massame*, *Manobra*,) a term used, in general, for all sorts of cord, whether small, middling, or great, made use of in rigging of ships. "Cordage cable-laid," as the seamen term it, is made with nine strands, i. e. the first three strands are laid slack, and then three of them being closed together, make a cable. See **CABLE**.

The same for tacks, but they are laid tapering.

"Cordage hawser-laid," is made only with three strands.

Cordage-stays are cable-laid, but made with four strands, as cables are with three; with the addition of a heart, which goes through the centre of them.

Cordage, white, is that which has not yet been tarred.

Cordage tarred in spinning, is that which is made of rope-yarn ready tarred.

Cordage tarred in the stove, is that which has passed through hot tar, in coming out of the stove. Every quintal of cordage may take about twenty pounds of tar. *Cordage re-made*, is that which is made of ropes used before.

Cordage, when very old, is used for oakum to caulk the seams of ships.

When a rope is said to be six inches, it is understood of its circumference. A rope of sixty threads is one composed of so many rope-yarns.

There have been a prodigious number of statutes passed for the regulation of the manufacture of cordage, as well as for the protection of the manufactured article, after being dedicated to the service of his Majesty's navy. The first of which it is necessary to make mention is 25 Geo. 3. c. 56., respecting the manufacture of cordage. See 1 *Dick. Pract. Expos.* 355.

Those which have been enacted relative to cordage which is made for, and has been received into, his Majesty's stores, are too numerous to be particularised here. They have been frequent from 31 Eliz. c. 4. to the present reign; and within the few last years, 53 Geo. 3. c. 126. 54 Geo. 3. c. 60. 54 Geo. 3. c. 159. 55 Geo. 3. c. 77. and 56 Geo. 3. c. 80., have been added to the number. 3 *Dick. Pract. Expos.* 201.

The general purport and effect of these has been to protect the king's stores from embezzlement, by directing the particular marks which shall be manufactured in, or placed upon, them, and by prohibiting all persons from becoming possessed of such com-

modities (except in certain circumstances) under pain of being treated as receivers of stolen goods. 39 & 40 Geo. 3. c. 89.

CORDOVAN-LEATHER, (GER. *Korduan*. DU. *Spaansleder*. DA. and SW. *Korduan*. FR. *Cordouan*. IT. *Cordovano*. SP. *Cordoban*. PORT. *Cordovao*. RUS. *Kordowan*. POL. *Kardyban*, *Kordyban*,) a sort of leather used in making boots and shoes, brought to us from Cordova, in Spain. A good imitation of this species of leather is manufactured in England.

CORIANDER-SEED. (GER. DU. DA. and SW. *Koriander*. FR. *Coriandre*. IT. *Coriandro*, *Curindolo*. SP. *Cilantro*, *Culantro*. PORT. *Coentro*, *Coriandro*. RUS. *Koriander*. POL. *Koryander*. LAT. *Coryandrum*.) Coriander-seeds are pretty regularly hemispherical. They are very light, and easily powdered, not so unctuous and moist, when bruised, as many other seeds, of a pale whitish colour. They should be chosen new, sound, and firm, of an aromatic smell, and pleasant taste. They are recommended as carminative and stomachic. Coriander-seeds yield by distillation a most delicious cordial, and are much used in confectionary.

CORK. (GER. *Kork*. DU. *Kork*, *Kurk*, *Vlothout*. DA. *Kork*, *Korktræ*. SW. *Korkträ*. FR. *Liège*. IT. *Sughero*, *Suvero*. SP. *Corcho*. PORT. *Cortica* (de *Soureiro*.) RUS. *Korkowoe derevo*. POL. *Korek*, *Kora*, *Korkoua*. LAT. *Suber*.) The cork-tree is an evergreen. It grows principally in Italy, Spain, Portugal, and on the French side of the Pyrenean mountains. The bark of this valuable tree is made into stoppers for bottles, serves fishermen, &c. as buoys, and when calcined yields ashes, from which Spanish black is made. The French cork-wood is the best we import.

CORK-CUTTER. The bark of the cork-tree is half burnt by the cork-cutter, and then, with a sharp knife, cut into corks for bottles, bungs for barrels, &c.

CORK-SCREWS. (GER. *Korkzieher*, *Pfropfenzieher*. DU. *Korktrekkers*. DA. *Korktrekker*. SW. *Korkskruf*. FR. *Tire-bouchon*. IT. *Rampinetta*. SP. *Saca-corchos*. PORT. *Saca-rolhas*.) The cork-screw is a well-known instrument for drawing corks out of bottles, &c. Cork-screws are manufactured chiefly at Birmingham, Sheffield, &c.

CORN, (GER. *Corn*, *Getreide*. DU. *Graanen*, *Koren*. DA. *Korn*. SW. *Süd*, *Spanmal*. FR. *Bleds*, *Grains*. IT. *Biade*, *Grani*. SP. *Granos*. PORT. *Graos*. RUS. *Chljeb*. POL. *Zboze*. LAT. *Frumentum*,) is the grain or seed of plants separated from the spica or ear, and used for making bread, &c. Such are wheat, rye, barley, oats, maize, pease, &c.

CORN-LAWS. It is against the common law of England to buy or sell corn in the sheaf, before it is thrashed and measured: the reason whereof seems to be, because by such sale, the market is in effect forestalled. 3 *Inst.* 197.

Every person who shall sell or buy corn without measuring, or otherwise than by the Winchester measure, sealed and stricken by the brim, shall on conviction before one justice, on the oath of one witness, forfeit 40s. besides the whole of the corn so sold or bought, or the value thereof, half to the poor, and half to the informer.

On complaint to a justice, that corn has been bought, sold, or delivered, contrary to the act, the proof shall lie upon the defendant, to make it appear by oath of one witness, that he sold or bought the same lawfully; and if he shall fail therein, he shall forfeit as before mentioned, to be levied by distress and sale. 22 & 23 C. 2. c. 8. and 12; and *K. v. Arnold*, T. 33 Geo. 3.

And if any mayor, or other head officer, shall knowingly permit the same, he shall on conviction, at the county sessions, forfeit 50*l.* half to the prosecutor, and half to the poor, by distress and sale. For want of distress, to be imprisoned by warrant of the justices, till payment be made. 22 Geo. 3. c. 8. s. 3.

By 1 & 2 Geo. 4. c. 87. the acts of the 31st, 33d, 44th, and 45th Geo. 3. for regulating the importation and exportation of corn, grain, meal, and flour into Great Britain, are repealed, and further provisions made in lieu thereof. Returns are to be made as therein directed.

The object of these returns was to determine the average prices of corn, for the purpose of allowing the exportation, or importation, of it, and for regulating the duties and bounties thereon, which were specified and regulated by several subsequent statutes, according to the circumstances of the successive periods. See 1 *Dick. Pract. Expos.* 368.

By a late statute on this subject, 55 Geo. 3. c. 26. it is enacted, that "thenceforth all corn, meal, or flour, the growth, produce, or manufacture of any foreign country, which may now by law be imported into the United Kingdom, shall be at all times allowed to be imported, and warehoused there duty-free; and may be taken out again under the regulations now in force, and exported duty-free."

And all such corn, meal, and flour, may be taken out of warehouse, and entered for home consumption, subject to the regulations now in force, whenever foreign corn, &c. of the same sort is admissible into the United Kingdom for home consumption, duty-free.

Foreign corn, &c. admissible for home consumption, whenever the average price of British corn shall be as follows:

Wheat at or above	-	80s. per quarter.
Rye, pease, and beans	-	53
Barley, beer, or bigg	-	40
Oats	-	27

But when British corn shall be below these prices, no foreign corn shall be imported, nor taken out of warehouse for home consumption.

Corn, the growth or produce of British Ame-

rica, may be imported for home consumption, according to a different scale, viz. when

Per Quarter.

Wheat shall be at, or above	67s.
Rye, pease, and beans	- 44
Barley, beer, and bigg	- 33
Oats	- 22

Corn, &c. from British America may at all times be imported and warehoused duty free, in order for future sale, duty free, when admissible by law for home consumption. 3 *Dick. Pract. Expos.* 206.

By 3 Geo. 4. c. 60. the above act is amended, and the importation of corn further regulated.

CORN-FACTOR, one who acts as factor both for the farmer and the buyer on commission. The factors sell at the Corn Exchange in Mark Lane, London, by sample, and send corn to other parts of Great Britain or Ireland, where corn is scarcer, or bears a better market.

CORNELIAN, (GER. *Karniol.* DU. DA. and Sw. *Karneol.* FR. *Cornaline*, SARDE. *Tr. Cornalina.* SP. *Cornerina.* PORT. *Cornelina*, CORNEIRINA. RUS. *Seredolik.* POL. *Sardyk.* LAT. *Carneolus, Sardus*.) a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white; it is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch, and two or three inches, in diameter. It is of a fine, compact, and close texture, of a glossy surface; and in the several specimens is of all degrees of red, from the palest flesh-colour to the deepest blood-red. The pieces of cornelian which are all of one colour, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful.

The cornelian is tolerably hard, and capable of a very good polish. It is not at all affected by acid menstrua; the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long continued heat will reduce it to a pale dirty grey. The finest cornelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia, and some very good found in Great Britain. Though the ancients have recommended the red cornelian as an astringent, and attributed a number of fanciful virtues to it, we know no other use of the stone than for seals and other ornaments, to which it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, and to take a good polish.

CORONER, is an ancient officer of this realm, so called because he deals wholly for the king and crown. *Bac. Abr. tit. Cor.*

Coroners are to be men of good ability, and have lands in fee in the county, where chosen, to answer all people; and if insufficient, the county shall answer for them. 2 *Inst.* 174.

There are coroners of the king's house-

hold, and of the verge of the king's palaces, of the Admiralty, of London, Southwark, and other particular franchises.

By the stat. *de officio coronatoris*, 4 Ed. 1. "The coroner is to go to the place where any person is slain or suddenly dead, and shall by his warrant to the bailiffs, constables, &c. summon a jury out of the four or five neighbouring towns, to make enquiry upon view of the body; and the coroner and jury are to enquire into the manner of killing, and all circumstances that occasioned the party's death, who were present, whether the dead person was known, where he lay the night before, &c. Examine the body if there be any signs of strangling about the neck, or of cords about the members, &c. Also all wounds ought to be viewed, and enquiry made with what weapons, &c. And the coroner may send his warrant for witnesses, and take their examination in writing; and if any appear guilty of the murder, he shall enquire what goods and lands he hath, and then the dead body is to be buried. A coroner may likewise commit to prison any person who is by his inquisition found guilty of the murder, and the witnesses are to be bound by recognizance to appear at the next assizes," &c.

By stat. 25 G. 2. c. 29, however, on every inquisition, (not taken upon the view of a body dying in gaol,) which shall be taken by the coroner in any township or place contributory to the rates directed by stat. 12 G. 2. c. 29, he shall have the sum of 20s.; and for every mile which he shall travel from the place of his abode, the further sum of 9d. shall be paid him out of the money arising by the said rates. And for every inquisition taken upon the view of a body dying in gaol, so much money, not exceeding 20s. shall be paid him as the justices at sessions shall think fit to allow, out of the money arising from the said rates. Provided that, over and above the recompence hereby appointed for inquisitions taken as aforesaid, the coroner who shall take an inquisition upon the view of a body slain or murdered, shall have the fee of 13s. 4d. payable, by stat. 3 H. 7. c. 1. out of the goods of the slayer or murderer, or out of the amerciaments upon the township, if the slayer or murderer escape. And coroners taking further fees shall be guilty of extortion.

But no coroner of the king's household, and of the verge of the king's palaces, nor any coroner of the Admiralty, nor of the county palatine of Durham, nor of the city of London and borough of Southwark, or of any of the franchises belonging to the said city, nor any coroner of any city, borough, town, liberty or franchise not contributory to the rates directed by stat. 12 G. 2. c. 29. or within which such rates have not been usually assessed, shall be entitled to any fee, recompence, or benefit given by this act.

CORPORATION, is a body politic or

incorporate, so called, as the persons are made into a body, and of capacity to take and grant, &c. Or it is an assembly and joining together of many into one fellowship and brotherhood, whereof one is head and chief, and the rest are the body; and this head and body knit together, make the corporation: also it is constituted of several members like unto the natural body, and framed by fiction of law to endure in perpetual succession. *Bac. Abr. tit. Corp.*

Of corporations, some are sole, some aggregate: sole, when in one single person, as the king, a bishop, dean, or the like; aggregate, which is the most usual, consisting of many persons, as mayor and commonalty, dean and chapter, &c. Likewise corporations are spiritual or temporal: spiritual, of bishops, deans, archdeacons, parsons, vicars, and other ecclesiastical persons; temporal, of mayors, commonalty, bailiffs and burgesses, &c.: and some corporations are of a mixt nature, composed of spiritual and temporal persons, such as heads of colleges and hospitals, &c. And all corporations are said to be ecclesiastical, or lay.

Bodies politic or incorporate may be, 1st, by prescription; 2dly, by letters patent, or 3dly, by act of parliament; but they are most commonly by patent or charter. 1 *Inst.* 250. 3 *Inst.* 202. 3 *Rep.* 73.

By 7 Geo. 3. c. 48. in companies or corporations instituted for carrying on particular trades, or dealing with joint stocks, no member shall vote in general courts, unless possessed of his stock six months (except acquired by bequest, marriage, succession to intestate's estate, custom of London, or settlement); the oaths are required to be conformable to this act.

No declaration of a dividend shall be made, but at one of the half yearly or quarterly general courts, at five months distance from the last preceding declaration; and for no more than the half year. And no question for a proposed increase of dividend shall be decided, but by ballot taken three days after breaking up of the court. *Ibid.*

CORSAIR, a pirate, or armed vessel, which plunders merchant vessels, particularly in the Mediterranean, without commission from any prince or power.

CORTEX WINTERANUS, (GER. *Winersrinde*, *Biltre zimmetrinde*. Du. *Wintersbark*. DA. & Sw. *Vintersbark*. FR. *Ecorce de Winter*, *L'ecorce sans pareil*, *Ecorce de caryocostin*. IT. *Scorza magellanica*. SP. *Cortexa Winterana* ó *Magellanica*. PORT. *Canella de Winter*. LAT. *Cortex Winteranus* s. *Magellanicus*.) or Winter's Bark. See BARK.

CORUS, Omer, Homer, or Chomer, in the Jewish antiquities, a measure containing 10 baths, 75 gallons, and 5 pints, as a liquid measure; and 32 pecks and 1 pint as a dry measure.

COSSAES, a species of Bengal muslin.

COSTS, in general acceptance, are the expenses incurred by proceedings at law or in equity, and these were not originally recoverable by the plaintiff or defendant at common law. 2 *Inst.* 288.

COS TURCICA, *Turkey-stone*, a species of stone of the garnet kind; it strikes fire with steel, and effervesces with acids. It is used as a whetstone; and those of the fairest grain are the best hones for the most delicate cutting tools, and even for razors, lancets, &c.

COSTUS, a long thick root, brought from the East Indies, of the colour of box, with a thick pale-coloured bark, of a warm, bitterish, aromatic taste, with a fragrant smell. It should be chosen fresh, compact, and well scented. It is used as a medicine in various chronic cases, and pays a duty of nearly 4*d.* per lb. on importation.

COTTA, a sort of measure used in the Maldives for measuring of cowries, a small shell that serves as money in some parts of Asia, and along the coast of Africa. It contains 12,000 of those shells.

COTTON, (GER. *Baumwolle*. DU. *Katoen*, *Boomwol*. DA. *Bomuld*. SW. *Bomull*. FR. *Coton*. IT. *Cotone*, *Bambagia*. SP. *Algodon*. PORT. *Algodão*. RUS. *Chlobtschataja bumaga*. POL. *Bawełna*. LAT. *Gossypium*, *Bombax*), a soft downy substance found on the *gossypium*, or cotton-tree. Cotton is separated from the seeds of the plant by a mill, and then spun and prepared for all sorts of fine work, as stockings, waistcoats, quilts, &c. With it are also made callico and muslin; and sometimes it is mixed with wool, sometimes with silk, and even with gold itself. The finest sort comes from the Brazils, from Bengal, and the coast of Coromandel. Cotton makes a very considerable article in commerce, and is distinguished into cotton-wool, and cotton-thread. The first is mostly brought from the Brazils, the West Indies, and America, and also from Smyrna: the most esteemed is white, long, and soft. Those who buy it in bales should see that it has not been wet, moisture being very prejudicial to it. Cotton is packed in the West Indies in bags of from 300 to 320 lb. weight each, and the tare allowed there is 3 per cwt. The best time of packing the cotton-wool is in moist or damp weather, provided it be done under cover.

Cotton-spinning is done by a machine called a *jenny*, and is the best contrivance for spinning woof or shoot that has yet been discovered. It is now commonly constructed for 84 threads; and with it one person can spin 100 English hanks in a day, each hank containing 840 yards.

Carding of Cotton, is a preparation for spinning, formerly performed by the hand, with a single pair of cards upon the knee. By a combination of machinery, cotton is now carded, roved, and spun with the utmost

exactness and equality; and such a degree of perfection attained in spinning warp, as is not to be equalled in any other part of the world. To these improvements this country is entirely indebted for the great extent of its cotton manufactures; large buildings having been erected for that branch both in England, Scotland, and Ireland, many of which contain several thousands of spindles, each driven by one or more large water-wheels; and some of such extent as to spin at the rate of a thousand yards of twist or warp-yarn in a minute. There is another machine called a *mule*, being a mixture of machinery between the warp-machine and the woof-machine, or hand-jenny. This machine is of great use in spinning cotton-yarn for muslins to a degree of fineness nearly equal in quality to those usually brought from the East Indies. The following account, inserted in most of the periodical publications of the day, by a manufacturer of Paisley, in Scotland, will supply a correct notion of the great progress which has recently been made in the manufacture of cotton fabrics, as well as of the importance to our commerce, of the article under consideration.

“Progress of a Pound of Cotton.”—There was sent to London lately from Paisley a small piece of muslin about one pound weight, the history of which is as follows. The wool came from the East Indies to London, from London it went into Lancashire, where it was manufactured into yarn; from Manchester it was sent to Paisley, where it was woven; it was sent to Ayrshire next, where it was tamboured; it was then conveyed to Dumbarton, where it was hand-sewed; and again returned to Paisley, when it was sent into Renfrewshire to be bleached. It was then returned to Paisley, whence it was sent to Glasgow, and was finished, and then sent per coach to London. It may be reckoned about three years, that it took to bring this article to market, from the time it was packed in India, till it arrived complete in the merchant's warehouse in London; whither it must have been conveyed 5000 miles by sea, nearly 1000 by land, and have contributed to reward the labour of nearly 150 persons, whose services were necessary in the carriage and manufacture of this small quantity of cotton, and by which the value has been advanced more than 2000 per cent.”

COTULA, or **COTYLAE**, among the Greeks, a liquid measure containing ten ounces of wine, and nine of oil. It is observed that the cotula was used also as a dry measure, from the authority of Thucydides, who in one place mentions two cotulæ of wine, and in another two cotulæ of bread.

COUCH, in painting, a term used for each lay or impression of colour, either in oil, or water, with which the painter covers

his canvas, wall, wainscot, or other matter to be painted.

COUIT, called also *guz*, a sort of aune or ell, used at Mocha for measuring linens and silks, of about twenty-four inches long.

COULTER, in husbandry, an iron instrument, fixed in the beam of a plough, and serving to cut the edge of each furrow.

COUNT-WHEEL, in the striking part of a clock, a wheel which moves round once in twelve or twenty-four hours.

COUNTERS in a ship, are two. 1. The hollow arching from the gallery to the lower part of the straight piece of the stern, is called the upper counter. 2. The lower counter is between the transom and the lower part of the gallery.

COUPANT, an oval piece of gold or silver of Japan, of various sizes. The coupants are not properly coin, but pass according to their weight.

COURON, *coroure*, *courou*, or *crou*, is ten millions of rupees, or a hundred lacks, the lack making a hundred thousand rupees.

COURSE, in navigation, the point of the compass or horizon which a ship steers on, or the angle which the rhumb-line, on which it sails, makes with the meridian; being sometimes reckoned in degrees, and sometimes in points of the compass. When a ship sails either due north, or south, she sails on a meridian, makes no departure, and her distance, and difference of latitude, are the same.

When she sails due east, or west, her course makes right angles with the meridian, and she sails either upon the equator, or a parallel to it; in which case she makes no difference of latitude, but her distance, and departure, are the same.

But when the ship sails between the cardinal points, on a course making always the same oblique angle with the meridians, her path is then the loxodromic curve, being a spiral, cutting all the meridians in the same angle, and terminating in the pole.

COURSES, in a ship, the main-sail and fore-sail; when the ship sails under them only, without lacing on them any bonnets, she is then said to go under a pair of courses. To sail under a main course and bonnets, is to sail under a main-sail and bonnet.

COURT-PLASTER, (GER. *Englisches pflaster*. DU. *Engelsch pleister*. DA. *Engelskt plaster*. SW. *Engelskt plüster*. FR. *Taffetas d'Angleterre*. IT. *Taffeta d'Inghilterra*. SP. *Tafetan embalsamado de Inglaterra*. PORT. *Tafeta de Inglaterra*. LAT. *Emplastrum Anglicanum glutinans*.) a glutinous salve laid on fine black silk, and used as a healing plaster for slight sores.

COVERLETS, (GER. *Bettdecken*. DU. *Beddedekkens*. DA. *Sengedekkener*. SW. *Sängtücke*. FR. *Couvertures*. IT. *Coperte da letto*. SP. & PORT. *Cobertores*. RUS. *Покрывало*. POL. *Koldry*.) are counterpanes or bed-covers in general. They are chiefly

made at Manchester, and in many parts of Lancashire, and are composed of cotton of various figures and patterns. They vary much in price according to their respective qualities and dimensions; but the average may be from 1 to 4 or 5*l*.

COWRIES, (GER. *Kauris*, *Schnakenköpfe*. DU. DA. RUS. & SW. *Kauris*. FR. *Coris*, *Cauris*, *Bouges*. IT. *Cori*, *Porcellane*. SP. *Bucios*, *Sigueyes*. PORT. *Bucios Zimbos*.) are small shells brought from the Maldives, which pass current as a coin on the coast of Africa, where the natives call them *Bouges*; their value is $\frac{1}{130}$ of a penny sterling.

CRADLE, among shipwrights, a timber frame made along the outside of a ship for the convenience of launching her with ease and safety.

CRAFT, in the sea language, signifies all manner of nets, lines, hooks, &c. used in fishing. Hence all such little vessels as ketches, hoys, and smacks, &c. used in the fishing trade, are called *small craft*.

CRAMP-IRON, or **CRAMPS**, a piece of iron bent at each end, which serves to fasten together pieces of wood, stones, &c.

CRANAGE, is a liberty to use a crane, for drawing up of wares and merchandise from vessels at any creek of the sea or wharf, unto the land, and making profit of it. It also signifies the money taken, and paid for the hire and use of a crane. Stat. 22 Car. 2. c. 11.

CRANE, a machine used in building, on wharfs, and in warehouses, for raising and lowering huge stones, ponderous weights, packages, &c.

CRANE-LINES, in a ship, are lines going from the upper end of the spritsail-topmast to the middle of the fore-stays. They serve to keep the spritsail-topmast upright and steady in its place, and to strengthen it.

CRANK, a contrivance in machines, in manner of an elbow, only of a square form, projecting from a spindle, and serving by its rotation to raise, and lower, the pistons of engines.

Crank likewise denotes the iron support of a lantern, and also the iron made fast to a stock of a bell for ringing it. In sea-language, a ship is said to be *crank-sided* when she can bear but small sail, for fear of oversetting; and when a ship cannot be brought on the ground without danger, she is said to be *crank by the ground*.

CRAPE, (GER. *Flohr*, *Krausflohr*. DU. *Floers*, *Lamfer*. DA. *Flor*, *Floer*. SW. *Flor*. FR. *Crêpe*. IT. *Espumilla*, *Sopillo*. SP. *Crespon*. PORT. *Sendal*. RUS. *Flori*. POL. *Flora*.) a light transparent stuff, in manner of gauze, made of raw silk gummed and twisted on the mill, woven without crossing, and much used in mourning. *Crapes* are either *craped* (i. e. *crisped*), or smooth: the first double, expressing a closer mourning;

the latter single, used for that less deep. The silk destined for the first is more twisted than that for the second; it being the greater, or less, degree of twisting, especially of the warp, which produces the crisping given to it, when taken out of the loom, steeped in clear water, and rubbed with a piece of wax for the purpose. Crapes are all dyed raw. The invention of this stuff came originally from Bologna; but, till of late years, Lyons is said to have had the chief manufacture of it. It is now manufactured in various parts of Great Britain.

CRAYON, (*Crayons*. GER. *Pastellfarben*. DU. *Pastelverwen*. DA. *Pastelfarver*. SW. *Pastellfärgor*. FR. *Crayons en pastel*. IT. *Pastelli*, *Paste da dipingere*. SP. *Pasteles*, *Pasta de colores*. PORT. *Pasteis*.) a name for all coloured stones, earths, or other minerals, used in designing or painting in pastel. Crayons may be made of any colour, and adapted for the representation of any objects, in the following manner. Take plaister of Paris, or alabaster calcined, and of the colour of which you intend to make your crayons, a sufficient quantity: grind them first asunder, and then together, and with a little water make them into a paste: then roll them with your hand upon the grinding-stone into long pieces, and let them dry moderately in the air; when they are to be used, scrape them to a point like a common pencil.

CREAM OF TARTAR, (GER. *Weinsteinrahm*. DU. *Wynsteenroom*. DA. *Vinsteenfløde*. SW. *Vinstenflötor*. FR. *Crème de tartre*. IT. *Crema di tartaro*. SP. *Cremor tartaro*. PORT. *Cremor de tartaro*. LAT. *Cremor tartari*.) called also crystals of tartar, is a preparation of tartar, and comes to us from Leghorn, and other parts of Italy. It is a combination of tartaric acid with potash. It is used in medicine as an aperient.

CREDIT, in commerce, a trust or loan of merchandise or money; and

CREDITOR, a person to whom any sum of money is due, either by obligation, promise, or otherwise. Creditors shall recover their debts of executors, or administrators, who in their own wrong, waste or convert to their use the estate of the deceased. 30 Car. 2. c. 7.

CREEPER, at sea, a sort of grapnel, but without flooks, used for recovering things fallen over-board.

CRENCLOS, in a ship, small ropes spliced into the bolt-ropes of the sails of the main-mast and fore-mast. They are fastened to the bow-line bridles; and are also to hold by, when a bonnet is shaken off.

CREW, the company of sailors belonging to a ship, boat, or other vessel. The sailors that are to work and manage a ship, are regulated by the number of lasts it may carry, each last making two ton. There are on board ship several particular crews or gangs, as the gun-room crew, the carpenter's crew, &c.

CRIMSON, one of the seven red colours of the dyers. See **DYEING**.

CROCUS. See **SAFFRON**.

CROSS-BAR SHOT, a bullet with an iron bar passing through it, and standing six or eight inches out at both sides: it is used at sea for destroying the enemy's rigging.

CROSS-TREES, in a ship, four pieces of timber, bolted and let into one another across, to the head of the mast. Their use is to keep and bear the top-mast up; for the top-mast is always fastened into them.

CROTCHES, in ship-building, very crooked timbers in the hold or bread-room, from the mizen-step aft, laid across the keelson, to strengthen the ship in the wake of the half-timbers.

CROTCHES, *iron*, crooked pieces of iron, used on board sloops and long-boats, which go with a shoulder-of-mutton sails, for the boom to lodge on.

CROW, a kind of iron lever with a claw at one end, and a sharp point at the other; used for heaving or purchasing great weights.

CROW'S FEET, in a ship, small lines or ropes, sometimes eight or ten, reeved through the dead-men's-eyes, and scarcely of any other use than to make a show of small rigging. They are usually placed at the bottom of the back-stays of the fore-topmast, mizen-topmast, and topgallant-mast.

CROWN, a general name for coins, both foreign and domestic, which are of, or very near the value of five shillings sterling. See **MONEY**.

CROWN-WHEEL of a watch, the upper wheel next the balance, which by its motion drives the balance, and in royal pendulums is called the swing-wheel.

CRUCIBLE, (*Crucibles*. GER. *Schmelztiegel*. DU. *Smeltkroesen*. DA. *Smeltdigler*. SW. *Diglar*, *Smäldiglar*. FR. *Creusets*. IT. *Crociuoli*. SP. *Crisoles*. PORT. *C-risoës*, *Cadinhas*. RUS. *Gorschki plavilnïe*. POL. *Tigiliki*. LAT. *Crucibula*.) a chemical vessel made of earth, and so tempered and baked as to endure the greatest fire. It is used to melt metals, and to flux minerals, ores, &c.

CRUISER, a fast sailing vessel, appointed by the Admiralty to cruise in certain latitudes, in quest of the enemy. Cruisers are frequently appointed to convoy merchantmen.

CRYSTAL, or **ROCK CRYSTAL**, (GER. *Krystall*. DU. *Crystall*. DA. *Crystal*. SW. *Krystall*. FR. *Crystal*. IT. *Cristallo*. SP. *Cristal*. PORT. *Crystallo*. RUS. *Chrystal*. POL. *Kryształ*. LAT. *Crystallus*.) the name of a very large class of fossils, hard, pellucid, and naturally colourless. Crystals are usually employed for seals, rings, and other trinkets.

CRYSTAL GLASS, or **FACTITIOUS**

CRYSTAL. (GER. *Krystallglas*. DU. *Crystallglas*. DA. & SW. *Crystalglas*. FR. *Crystal factice*. VERRE *cristalin*. IT. *Cristallo fattizio*. SP. *Cristal facticio*. PORT. *Crystalto artificial*.) The very fine clear glasses, made in imitation of precious stones, are sometimes called factitious crystals, but much more commonly *pastes*. Our opticians, and other artists, distinguish the dense white glass by the name of crystal-glass, and frequently by that of white flint.

CUBEBS, *cubeba* of the shops, (GER. *Kubeben*. DU. *Koebeben*. DA. *Cubeber*. SW. *Kobeber*, *Cobeber*. FR. *Cubebes*. IT. *Cubebi*. SP. *Cubebas*. PORT. *Cobebas*. RUS. *Kubebii*. POL. *Kubeby*. LAT. *Cubebae*.) a small dried fruit resembling a grain of pepper, but somewhat longer; brought into Europe from the island of Java.

CUDBEAR, a dye made from an excrescence that grows upon rocks and stones, a species of the lichen or rock moss, which, with certain chemical preparations, makes a fine lilac dye. It is chiefly manufactured in Glasgow. See **LICHEN**.

CUDDY, in large ships, a place lying between the captain-lieutenant's cabin and the greater-deck, under the poop. It is divided into partitions for the master and other officers.

CULM, a term exclusively applied by dealers in pit-coal, to denote such coal as does not cake, or adhere together, when heated. Small pieces of coal of this kind are of much less value than larger pieces; and on this account, the duties on culm are less than upon coal.

CULVERTAIL, among shipwrights, signifies the fastening or letting of one timber into another, so that they cannot slip out, as the corlings into the beams of a ship.

CUMMIN-SEED, (GER. *Kumin*, *Langer Kümmel*. DU. *Komyn*. DA. *Kummen*, *Haugekummen*. SW. *Kummin*, *Cumin*, *Spiskumin*. FR. *Cumin*. IT. *Comino*, *Cumino*. SP. *Comino*. PORT. *Cuminho*, *Cominhos*. RUS. *Kmin*, *Timon*. POL. *Kmin*, *Kmin kramny*. LAT. *Cuminum*, *Cuminum semine longiore*.) a long slender seed, not so thick as the aniseed, but nearly twice its length. The plant is propagated for sale in the island of Malta. The seeds are used in medicine, and, made into a plaister, are the most efficacious application hitherto discovered for the cure of rheumatic lumbago. It is an annual plant, perishing soon after the seed is ripe.

CUNNER, a kind of shell-fish, less than an oyster, that sticks close to the rocks.

CURCUMA. (GER. *Kurkumey*. DU. *Kurkuma*. DA. *Gurgumeye*. SW. *Gurkmäja*. FR. *Curcuma*, *Terre-merite*. IT. & SP. *Curcuma*. PORT. *Curcuma*, *Açafrão da India*. RUS. *Kurkuma*. POL. *Safranica*, *Ostryz Indyjski*. LAT. *Terra merita*, *Curcuma*.) This plant is a native of India. The roots are

brought to Europe for use. It is very tender, and will not live in this country, except in a stove. It is propagated by parting the roots. The root communicates a beautiful, but perishable, yellow dye, with alum.

CURRENTS, (GER. *Korinthen*. DU. *Korenten*, *Krenten*. DA. *Korender*, *Korinther*. SW. *Corinter*. FR. *Raisins de Corinthe*. IT. *Uve passe di Corinto*. SP. *Pasas de Corinto*. PORT. *Passas de Corinto*. RUS. *Korinka*, *Opoek*. POL. *Roxynki male*, *drobne*. LAT. *Passulæ corinthiacæ*.) a smaller kind of grapes, brought to us principally from Zante and Cephalonia. They are gathered off the bunches, and laid to dry in the sun, and packed up in large butts. They are mostly used for culinary purposes.

CURRENCY. In America and the West Indies accounts are kept in pounds, shillings, and pence, as in Great Britain; the word *currency* being used instead of *sterling*. In most of the British settlements on the continent of America, &c. they have few coins of any sort circulating among them; what few they have are generally French and Spanish pieces; so that they are obliged to substitute a paper *currency*, for a medium of their commerce, for want of a competency of cash for circulation. In Jamaica, 140*l.* *currency* is equal to 100*l.* *sterling*; but the state of *currency* differs in almost all the West India Islands. See **EXCHANGE**.

CURRIERS. If any currier do not curry leather sent to him, within sixteen days between Michaelmas and Lady-day, and in eight days at other times, he shall on conviction thereof forfeit *5*l.** 12 Geo. 2. c. 25.

A great number of statutes have been passed for the regulation of curriers, as well to prevent their obtaining hides dishonestly, as their defrauding the revenue arising from the duties on leather.

The 9 Ann. c. 11., 41 Geo. 3. c. 53., 39 & 40 Geo. 3. c. 66., and 41 Geo. 3. c. 53., were successively passed with these views. By 48 Geo. 3. c. 60. no tanner shall by himself or any other use the trade of a shoemaker, *currier*, leather-cutter, or other artificer, working or cutting of leather, upon pain of forfeiting every hide and skin by him wrought or tanned, or the value thereof, to be recovered by action.

By 56 Geo. 3. c. 110. which is entitled an act for the further regulation of tanners and curriers, the former statutes are reviewed, and new penalties annexed to offences. By this, tanners are prohibited from concealing hides under a penalty of 200*l.*; and curriers are forbidden to use *sumac* in the preparation of leather under a penalty of 100*l.* 3 Dick. Pract. Expos. 487. V. 3 G. 4. c. 83. s. 7.

Every currier, or dresser of hides in oil, shall annually take out a licence from the commissioners or officers of excise.

CURRYING, is the last preparation of leather which it puts in a condition to be made up into boots, shoes, saddles, &c. and is performed in two ways, either upon the *flesh*, or the *grain*: in dressing leather for shoes *on the flesh*, the first operation is soaking the leather in water until it be thoroughly wet; then the flesh side is shaved on a beam, that is a sort of wooden block fixed on the ground, to which the currier stands to his work, with a knife of a peculiar construction. The knife used for this purpose is of a rectangular form, with two handles, one at each end, and a double edge. The best knives are manufactured at Cirencester, and are composed of iron and steel: the edge is made by rubbing them on a flat stone of a gritty substance, till it comes to a kind of wire; the wire is taken off by a finer stone, and the edge is then turned to a kind of groove wire, by a piece of steel in the form of a bodkin; this steel is used to renew the edge in the operation. After the skin is properly shaved, it is thrown into water again, and scoured upon a board, or stone, appropriated to the use. Scouring is performed by rubbing the grain or hair side with a piece of pumice-stone, or some other stone of a good grit, by which means a white sort of substance is produced out of the leather, called the *bloom*, generated in the operation of tanning. The hide is then conveyed to the shade or drying-place, when the oily substances are applied, which are put on both sides of the leather, but in a greater and thicker quantity on the flesh side, than on the hair side. When it is quite dry, it undergoes another operation, for the purpose of softening the leather. Whitening or paring succeeds, which is performed with a fine edge on the knife already described. It is then *boarded up*, or grained again, by applying the graining-board first to the grain side, and then to the flesh side. It is now fit for *waxing*, which is performed by rubbing it with a brush dipped in a composition of oil and lamp-black, on the flesh side, till it is thoroughly black; it is then *sized*, called black sizing, with a brush or sponge, dried, and tallowed. After undergoing some other operations, this sort of leather, called waxed leather, is *curried*. For leather curried on the hair side, termed *black on the grain*, the first operation is the same with that already described, till it is scoured. Then the black is applied to it while wet, which is a solution of copperas in water; this is first put upon the grain, after it has been rubbed over with a brush dipped in urine, and when it is dry it is *seasoned*, that is, rubbed over with a brush dipped in copperas water on the grain, till it is perfectly black; after this the grain is raised with a fine graining-board, and the leather is oiled with a mixture of oil and tallow; when it is finished, and fit for the shoemaker, &c.

CURRY-COMBS, (GER. *Striegel*. DU. *Roskammen*. DA. *Strigler*, *Hesteskraber*. SW. *Hüstsrapor*. FR. *Etrilles*. IT. *Striglie*, *Strogghie*. SR. *Almohazas*, *Bruzas*. PORT. *Almofacas*. RUS. *Skreblizau*. POL. *Grzebla*.) are iron combs, used for dressing the coats of horses, and principally manufactured at Birmingham, Wolverhampton and Walsal.

CUSHTREES, a species of Indian callico.

CUSTOM of merchants. If a merchant gives a character of a stranger to one who sells him goods, he may be obliged to satisfy the debt of the stranger for the goods sold, by the *custom of merchants*. And when two persons are found in arrears, upon an account grounded on the custom of merchants, either of them may be charged to pay the whole sum due. See **BILLS OF EXCHANGE**, **BANKRUPT**, **INSURANCE**.

CUSTOM-HOUSE. Custom-houses are established at all the sea-ports in Britain and Ireland, where entries are made of goods exported or imported, and the duties laid on by law paid; or where drawbacks are allowed on goods exported, the documents are received, by which the money allowed is to be obtained.

When goods are to be exported, a bill of entry must be made out, stating the articles and their value, and mentioning the name of the ship and captain. There must be seven copies made out, one of which must be in words at length, called the warrant; when the customs are discharged, a parchment certificate thereof, called a cocket, is received, on the back of which must be indorsed the mark, and number, of the goods, together with a copy of the bill of entry: after this has been given to the searcher, with his receipt, the goods are shipped, and a receipt given by the master of the ship, who then signs the bill of lading.

When goods paying duty, and others free, are exported at the same time, there must be two cockets.

Goods exported by certificate—that is, goods which have been imported and paid duties, and which are to receive a drawback; mention must be made of the marks, numbers, name of the ship, &c. in which they were imported, and affidavit made that the duties were paid, or security given: on which the collector, or his deputy, will grant an order, to be given to the surveyor, searcher, and land-waiter, that they may certify the quantity; after which the said certificate must be brought back to the collector and comptroller, and oath made that the goods are really shipped, and not to be landed again in Great Britain.

When this is done, the sum on each particular part of the duties is written in words at length, and in figures, on the back of the debenture, specifying particulars, which is

subscribed jointly; and in one month after the departure of the ship, the drawback may be demanded, and is payable.

Almost every species of goods pays a duty on importation, and they are delivered either by tale, weight, measure, or gauge. Those which pay by tale at the delivery, to be tallied 1, 2, 3, &c.

Goods paying duties by weight, are weighed at the king's beam.—A deduction is to be made called tare; the only deduction now allowed for the outside package.

The allowance for tare is in some cases fixed; and when it is not, then it is to be ascertained by two landing surveyors, if in London, and in other ports by the collector and surveyor.

Goods rated by measurement, are of three different sorts.

Linens and cloths of all sorts are reckoned by taking the length of the piece.

Paving stones, marble slabs, pictures, by superficial feet; blocks of stone and timber, by solid feet.

Wine, spirits, and all sorts of liquids, are estimated by gauging the casks.

In making entries, a merchant generally includes all goods he has on board of the same ship, although of different sorts.

Goods imported, unshipped and landed, are forfeited, unless the duties are paid, tendered, or agreed for, with the collector.

There is a book of tares alphabetically arranged, from which the allowances made on that account may be found.

The business of merchants applying at the Custom-house is to be dispatched in the order they have applied; and any officer either unduly detaining one, or expediting another, for a reward, is to be dismissed, and never again to get admittance to the Custom-house.

Any merchant may break bulk, that is, take out part of his cargo, paying for that only, provided the master of the ship make oath as to the contents, and farther, that when he lands the remainder at that, or another, port, he shall certify as to the quantity landed before, together with their quality, and the name of the person whose property they were.

The clerks at the long-room attend from nine in the morning till three in the afternoon, and the officers at the harbours from six to six in summer, and from sun-rising to sun-setting in winter.

CUSTOMS, taxes levied upon goods when exported from, or imported into, a state. This mode of raising a public revenue is of great antiquity, as it may be traced back to the time of Solomon; but in modern times it has been extended by different states to almost every article of commerce.

The customs of England were formerly divided into three branches; viz. 1st, the duties on wool and leather; 2d. a duty upon

wine, which being imported at so much a ton, was called a tonnage; and 3d. a duty upon all other goods, which being imported at so much in the pound on their supposed value, was called a poundage. In the 47th Edward III. a duty of sixpence in the pound was imposed on all goods exported, or imported, except wool, wool-fells, leather, and wine, on which particular duties had been granted before.

In 14 Rich. II. it was raised to one shilling in the pound; but three years afterwards was again reduced to sixpence. It was raised to eight-pence in the 2d Hen. IV. and in the fourth year of the same prince to one shilling; from which time to the 9th of Will. III. it continued at one shilling in the pound. The duties of tonnage and poundage were generally granted by the same act, and were called the subsidy of tonnage and poundage. The subsidy of poundage having continued so long at one shilling in the pound, or at 5 per cent. a subsidy came in the language of finance to denote a general duty of this kind at 5 per cent.

These duties on the estimated value of goods imported, or exported, being liable to great inaccuracy and irregularity, the value of the different articles of commerce was ascertained by a book of rates, and computed on the qualities: there was a mode also by which duties were imposed on goods not rated; this was by a proportion on the real value, as sworn to by the merchant. These principles once adopted, were pursued in every new subsidy; till the various additional duties imposed on articles of foreign trade, in almost every year of war since the Revolution, with the occasional repeal of some of the old duties, and the different bounties and drawbacks allowed on exportation, caused an accumulation of perplexity, which in time had rendered the customs a complete mass of confusion, attended with infinite inconvenience and delay in business. To remedy this evil, in 1787 all the old duties were abolished, and a single duty on each article substituted in their stead. This arrangement was, at the same time, extended to the excise and stamp duties. The progress of this branch of revenue shews the vast importance of foreign trade, if considered merely as furnishing a convenient mode of taxation. In the reign of king John, the whole of the duties payable by merchants in this country were farmed for 1000 marks.

From some acts of Henry III. it appears that considerable frauds were committed in the revenue of customs; it began, however, to increase, and in the reign of Edw. III. the customs of the port of London alone amounted to 12,000 marks per annum. In 1590, the produce of the customs was considerably improved; and in 1613 it amounted to 148,075*l.* 7*s.* 8*d.* of which 109,572*l.* 18*s.* 4*d.* was collected in the port of London, whilst only 38,502*l.* 9*s.* 4*d.* was received from all

the other ports of England. Of the total, 16,794*l.* 16*s.* 2*d.* arose from duties outward, and 61,280*l.* 11*s.* 6*d.* from duties inward. By the act of union in 1706, the customs of Scotland are stated at 30,000*l.* per annum, and those of England at 1,341,559*l.* per an-

num; since which period the great increase of foreign trade, and the many new duties which have been imposed, have swelled the revenue of the customs to its present magnitude. See DUTIES, EXCISE, and REVENUE.

Abstract of the net Produce of the Revenue of Great Britain, in the Years ended 5th January 1822, and 5th January 1823; distinguishing the Quarters: and also the total Produce of the Customs and Excise.

CUSTOM-OFFICERS, or **CUSTOM-HOUSE-OFFICERS** shall not have any ships of their own, nor may they use merchandise factorage, nor keep a tavern, &c. They are prohibited from trading in brandy, coffee, &c. or any excisable liquor, on pain of 50*l*. For taking a bribe they shall forfeit 100*l*.; and 500*l*. for making collusive seizures, &c.

Every merchant making an entry of goods, either inwards, or outwards, shall be dispatched in such order as he comes in; and if any officer or his clerk shall, for favour or reward, put any merchant or his servant, duly attending to make entries, by his turn, to draw any reward or gratuity from him, besides what is limited in the act of tonnage and poundage, &c. he shall be

strictly admonished to his duty ; or if found faulty, he shall be discharged, and not permitted to sit any more in the Custom-house. The officers who sit above in the Custom-house of London, shall attend their several places from nine in the morning to three in the afternoon ; and one officer, or clerk, shall attend with the book, in the afternoon, during such time as the officers are appointed to wait at the water-side.

CUTLASS, a broad cutting sword chiefly used at sea, being of infinite service in enabling seamen to board an enemy.

CUTLER. The business of a cutler is forging, tempering, and mounting all sorts of knives, forks, razors, scissors, shears, &c. There are also *sword-cutlers*, who finish all kinds of swords, sabres, &c.

CUTLERY, includes all kinds of knives and forks, razors, scissors, shears, &c. which are manufactured in the greatest perfection at Sheffield, in Yorkshire. The Birmingham, Wolverhampton, &c. manufactures in

this branch are by no means equal to those of the first-mentioned place.

CUTTANEES, a species of East India callico.

CUTTER, a fast sailing vessel. See SHIP.

CUT-WATER, or *knee of the head*, the sharpness of the head of the ship, below the beak ; so called because it cuts or divides the water before it comes to the bow.

CYDER. See CIDER.

CYMOPHANE, the oriental chrysolite of jewellers. This stone has been found only in Brazil, the island of Ceylon, and at Northschink, in Siberia. It is usually met with in round masses about the size of a pea, but it is sometimes crystallized. The colour is yellowish-green, surface sparkling.

CYPRESS. The wood of this tree, which grows abundantly in North America, is said to resist worms, moths, and putrefaction.

DAM

D, The fourth letter of the alphabet, as *a*, a numeral denotes 500 : and with a dash over it, thus, *Ď*, 5000. In the Gothic characters it is half the M, which imports 1000.

DAALDER, a Dutch piece of thirty sols, or one florin of their money. This species of money is also coined at Hamburgh, and is called *daalders-lup*, or *lub*. The daalder is equivalent to 1s. 2d. British.

DAEZAJIE, a silver coin current in Persia, worth five mamoudis, and two of them make the hasaer denarie. It is equal to 3s. 4d. sterling.

DALLE, an imaginary money of account in Germany, worth thirty-two sols lubs, or forty French sols ; the sol lub being somewhat more than the sol tournois. The value of the dalle is about 1s. 8d. of our money.

DAMAGE, on goods imported, except tobacco and wines, is to be adjusted by two disinterested merchants upon oath ; to be chosen by the principal officers, &c. See DEBENTURE.

DAMAGES, in law, signifies what the jurors are to enquire of, and return by their verdict, when it passeth in favour of the plaintiff. In certain cases, double, and even treble, damages are allowed for recompence, but those are in cases specially provided for by particular statutes.

DAMASCUS Steel, a very fine kind of

DAM

steel made at Damascus, and other parts of the Levant, remarkable for its excellent temper.

DAMASK, (GER. *Du.* and *Sw.* *Damast*. *Da.* *Damask*. *Fr.* *Damas*. *It.* *Sr.* and *Port.* *Damasco*. *Rus.* *Kamka*. *Pol.* *Adamasek*.) a silk stuff, with a raised pattern, so that the right side of the damask is that which has the flowers raised or saturated. Damasks should be of dressed silk, both in warp and woof ; and in France, half an ell in breadth : they are made at Chalons, in Champagne, and some places in Flanders, as at Tournay, &c. entirely of wool, 3-8ths of an ell wide, and 20 ells long.

DAMASK, (GER. *Damasten Tafelzeug*. *Du.* *Damaskwerk*. *Da.* *Damasklinnen*. *Sw.* *Damastlinne*. *Fr.* *Venise*. *It.* *Tela damaschima*. *Sp.* *Tela adamascada*. *Port.* *Guarnicao de mesa adamascada*. *Rus.* *Kamtschatnii salftiki*.) is also a kind of wrought linen made in Flanders, and in the United Kingdom. It takes this name on account of its resemblance to silken damasks, and is chiefly used for table linen.

The damask table-cloths made in the north of Ireland are in high repute, both at home, and abroad ; and they now make them of great beauty in Scotland of cotton-thread.

DAMASKEENING, or **DAMASKING**, the art or operation of beautifying iron, steel, &c. by making incisions in them, and filling them up with gold and silver wire ; chiefly used for adorning sword-blades,

guards and grips, locks of pistols, &c. Damaskeening partakes of the mosaic, of engraving, and of carving: like the mosaic, it has inlaid work; like engraving, it cuts the metal representing different figures; and as in chasing, gold and silver are brought in relief. There are two ways of damasking: the one, which is the finest, is when the metal is cut deep with proper instruments, and inlaid with gold and silver wire; the other is superficial only.

DAMASSE, or *petite venise*, a kind of wrought linen manufactured in Flanders, so called from its being adorned with large flowers or figures, like silken damasks. It is used chiefly for table-cloths, napkins, &c. There is also a silk stuff so called, which looks like a damask on one side, and on the other is plain.

DANK, or **DANEX**, a small silver coin current in Persia, and some places of Arabia: it weighs 1-6th of a dram, and has its correspondent value. It is also a small weight used by the Arabians, for precious stones, &c. It is 1-16th part of an Arabian drachm, or 80 French grains.

DATES, (GER. *Datteln*. DU. *Dadels*, *Daayen*. DA. *Dadeler*. SW. *Dadlar*. FR. *Dattes*. IT. *Datteri*. SP. *Dátiles*. PORT. *Tamaras*. RUS. *Finiki*. POL. *Daktyle*. LAT. *Dactyli*.) the fruit of the greater palm-tree; they are of the shape of an acorn, but bigger, and contain, under a thin yellow skin, a pulp of a sweetish slimy taste, and under this a long, hard kernel, with a furrow running its whole length. Dates are to be chosen large, yellow, with few wrinkles, plump, fleshy, of a whitish colour towards the kernel, and of a vinous taste.

DAY-BOOK, the book in which are entered the quantity and value of goods sold each day, and other diurnal transactions, such as contracts, &c.

DAYS of grace, are a customary number of days allowed for the payment of a bill of exchange, &c. after the same becomes due. See **BILLS OF EXCHANGE**.

DEAD-MEN'S EYES, in the sea language, a kind of blocks with many holes in them, but no sheevers, by which the shrouds are fastened to the chains: the crow-feet reeve also through these holes; and, in some ships, the main-stays are set tawt in them; but then they have only one hole, through which the lan-yards are passed several times.

DEAD-RECKONING, the estimation or conjecture which seamen make of the place where a ship is, by keeping an account of her way by the log.

DEALS, or **DEAL-BOARDS**, (GER. *Dialen*. DU. *Deelen*. DA. *Dæler*. SW. *Tiljor*. FR. *Planches minces*. IT. *Tavole, Piane*. SP. *Tablas poco gruesas*. PORT. *Taboinhas*. RUS. *Doki*. POL. *Taroice*.) a thin kind of fir-planks, of great use in carpentry: they are formed by sawing the trunk of a tree into

a great many longitudinal divisions, of more or less thickness, according to the purposes they are intended to serve. Deals are rendered much harder, by throwing them into salt water as soon as they are sawed, keeping them there three or four days, and afterwards drying them in the air or sun; but neither this, nor any other, method yet known will preserve them from shrinking. Deals are imported by us from Dantzic, Petersburg, Narva, and many other ports in the Baltic, and from North America; but those from Christiania, the capital of Norway, are the best in the world, and bear much the highest price in the English markets. They are distinguishable from those that are even produced in the contiguous provinces of the Norwegian kingdom, and the whole of their superiority is said entirely to arise from the more perfect operation of sawing them.

DEBENTURE, is a certificate delivered at the Custom-house, when the exporter of any goods or merchandise has complied with the regulations prescribed by certain acts of parliament, in consequence of which he is entitled to a bounty or drawback on the exportation. This certificate is signed by the officer of the customs when the goods are regularly entered and shipped, and the ship cleared out and upon her intended voyage: debentures may be made out from the entries of the exporter, who then can claim drawbacks, &c.

Stealing debentures was made felony by 2 Geo. 2. c. 25. s. 3.

DEBIT, among book-keepers, is used to express the left-hand page of the ledger, to which are carried all articles supplied, or paid, on the subject of an account, or that are charged to that account.

DEBT, a sum due from one person to another, in consequence of work done, goods delivered, or money or other value, for which reimbursement has not been made.

The non-payment in these cases is an injury, for which the proper remedy is by action of debt, to compel the performance of the contract, and recover the special sum due. 4 Co. 90.

DEBTOR, a person owing money to his creditor. See **title INSOLVENT**.

DECANTER, a glass vessel used for pouring wine into. Decanters cut in the most ingenious and elegant style are made in many towns of Great Britain, and large quantities are annually exported to all parts of the world.

DECK, of a ship, is a planked floor from stem to stern, upon which the guns lie, and where the men walk to and fro. Great ships have three decks, first, second, and third, beginning to count from the lowermost. Half-deck reaches from the mainmast to the stern of the ship. Quarter-deck is that aloft the steerage, reaching to the round-house. Flush-deck is that which lies even in a right line fore and aft, from stem

to stern. A rope-deck is made of cordages, interwoven and stretched over a vessel, through which it is easy to annoy an enemy who comes to board her. They are little used but by small vessels, to defend them from privateers. See SHIP, SHIP-BUILDING.

DEED, *in law*, is an instrument in writing, on parchment, or paper, and under seal, containing some conveyance, contract, bargain, or agreement between the parties thereto; and it consists of three principal points, writing, sealing, and delivery; writing, to express the contents — sealing, to testify the consent of the parties — and delivery, to make it binding and perfect. 2 *Bl. Com.* 298.

And it seems that ten things are necessarily incident to a deed: 1. That it should be in writing. 2. That it be on parchment, vellum, or paper. 3. A person able to contract. 4. By a sufficient name. 5. A person able to be contracted with. 6. By a sufficient name. 7. A thing to be contracted for. 8. Apt words required by law. 9. Sealing: And, 10. Delivery.

Every instrument in writing is not a deed; for a contract may be in writing, and not by deed, (it being under seal,) and if so, it is but as a parol agreement.

It is essential that all the matter thereof be written before the *sealing and delivery* of it: for if a man seals and delivers a blank piece of parchment or paper, although he therewith gives commandment that an obligation, or other matter shall be written on it, which is done accordingly, yet this will not make it a good deed.

A deed may be written in any hand, as in text, court, or Roman hand; or in any language, as in Latin or French, and is as good, as a deed written in English, and in common hand.

If there be any alteration, erasure, or interlining made in any part of the deed before the delivery of it, this will not hurt the deed, but in all such cases it is proper to make a memorandum thereof, upon the back, or margin, of the deed, and to give the witnesses notice of it.

A deed sealed and delivered, it is said, may be good without signing; for the seal is the essential part of the deed; but it is usual to have deeds signed; and there must be witnesses to the sealing, and delivery, who are to indorse or under-write their names thereon.

A deed may be good without all the orderly and formal parts; but if it be without delivery by the party himself, or his attorney lawfully authorized, to the party to whom made, or some other to his use, it is no deed.

Of deeds there are two sorts, deeds indented, and deeds poll; which names principally arise from the form of them, the one being cut in, and out, at top, dentwise, and

the other plain; that is, shaved close, from whence it takes the name of deed-poll.

A deed-poll is said to be a deed testifying that only one of the parties to the agreement hath put his seal to the same, where such party is the principal, or only person whose consent or act is necessary to the deed: and it is therefore a plain deed without indenting, and is used when the vendor, for example, only seals, and there is no need of the vendee's sealing a counter-part, because the nature of the contract is such as it requires no covenant from the vendee, &c.

Deeds by *indenture*, are, where there are several parts belonging to the feoffor, grantor, or lessor, who has one, and the feoffee, grantee, or lessee, who has another; and some other persons, as trustees, a third, &c. and the deed-poll, which is single, and of but one part, is delivered to the feoffee, or grantee, &c.

All the parts of a deed indented, in judgment of law, make but one entire deed; but every part is of as great force as all the parts together. But a deed-poll is the sole deed of him that makes it, and the words thereof shall bind him only.

Deeds have several formal parts, *viz.* the premises, *habendum, reddendum*, condition, covenants, warranty, date, sealing, &c.

The premises set forth the proper names of the parties, with their additions of place and quality: the lands and tenements intended to be conveyed, with the consideration of the deed, as money, natural love, &c.

The *habendum* fixes the certainty of the estate granted, for what time the grantee is to have it, and to what use.

The *reddendum* is that clause in the deed which reserves some new thing to the grantor, as rent, suit, service, &c. and is usually made by the words yielding, paying, doing, &c.

Conditions and covenants in deeds are for the holding, or not holding, of the estate granted, on performance of some act: and a condition relating to a real estate is a quality annexed by him that hath the estate, interest, or right, in the same, whereby the estate granted may be defeated, enlarged, or created, upon an uncertain event.

The warranty in deeds is to secure the estate to the grantee and his heirs, &c. and is a covenant real, annexed to the land granted, by which the grantor and his heirs are bound to warrant the same to the grantee and his heirs, and that they shall quietly hold and enjoy it; or upon voucher, &c. the grantor shall yield other lands, to the value of what shall be evicted.

In witness whereof, &c. ascertains the date of the deed; and is as well part of it as what is written before.

In deeds, the consideration is a principal thing to give them effect: and the foundation of deeds ought always to be honest.

False English will not make a deed void: but rasure or interlineation in a material part, will render the same void, unless some memorandum be made thereof on the back of the deed, testifying its being done before sealing. And if words are blotted out in a deed, by a grantee or lessee himself, after execution, although it be not in a place material, it will make the deed void.

In deeds indented all parties are estopped, or concluded, to say any thing against what is contained in the deed.

But if fraudulently made, when got by corrupt agreement, as on usurious contract, and when made by force or duress, &c. are void: or if by fraud, accident, or mistake, a deed is framed contrary to the intention of the parties in their contract on the subject, the parties claiming under it may take the advantage of proceeding in a court of common law, against the conscience of the case; a court of equity will on this ground interfere to restrain proceedings at law until the matter has been properly investigated; and if it finally appears that the deed has been improperly obtained, or that it is contrary to the intention of the parties in their contract, will in the first case compel the delivery and cancellation of the deed; and in the second case will either rectify the deed according to the intention of the parties, or will restrain the use of it in the points in which it has been framed contrary to, or gone beyond, their intention in the original contract.

On the ground of mistake, the courts of equity have frequently interfered in a variety of instances, and particularly in the cases of defective securities for money, and of marriage settlements founded on previous articles, where the settlement has been contrary to the evident intention of the parties in the articles. *Miff.* 116, 117.

DEEDS, stealing of. At common law, bonds, bills, and notes, which concern mere choses in action, were held not to be such goods whereof larceny might be committed: but by stat. 2 Geo. 2. c. 25. the stealing thereof shall be felony of like degree as in stealing of other goods of like value.

DEEP SEA-LINE, or DIP SEA-LINE, in the sea-language, a small line to sound with. Some of this description of line are 150 fathoms long, with a hollow plummet at the head, and tallow put into it, to bring up stones, gravel, sand, shells, and the like, from the bottom, in order to know the differences of the ground; which, being entered from time to time in the ship's books, by comparing of observations, the mariners guess, by their soundings, &c. what coasts they are on, though they cannot see land.

DEFAMATION, is when a person speaks scandalous words of another, whereby he is injured in reputation, for which the party offending shall be punished according to the nature and quality of his offence;

sometimes by action on the case at common law, sometimes by statute, and sometimes by the ecclesiastical laws.

Defamation is also punishable by the spiritual courts. And by 27 Geo. 3. c. 44. suits in ecclesiastical courts for defamatory words shall be commenced within six months.

DEFENCE, in a legal signification, is applicable to a plea, and is that which the defendant ought to make immediately after the count or declaration, viz. that he defends all the wrong, force, and damages, where and when he ought, &c. *Terms de Ley.*

When the plaintiff hath stated his case in the declaration, it is incumbent on the defendant within a reasonable time to make his defence and to put in a plea, or else the plaintiff will at once recover judgment by default, or *nihil dicit* of the defendant. *3 Black.* 296.

DEFENDANT, the person accused or sued.

DEGREE, a division of a circle, including a 360th part of its circumference. Every circle is supposed to be divided into 360 parts, called *degrees*, and each degree divided into 60 other parts, called *minutes*; each of these minutes being again divided into 60 seconds, each second into thirds, and each third into fourths, and so on.

DELFT, or DELF, (GER. *Fayence, Unächtes Porzellän, Halbporzellan.* DU. *Delfs porcelyn.* DA. *Fajance, Uægte Porcelain.* SW. *Fajance.* FR. *Faience.* IT. *Maio-lica.* SP. *Loxa de Fayanxa, China imitada.* PORT. *Faiença, Louça vidrada.* POL. *Farfurki*.) a kind of coarse porcelain, originally so called from Delft, the place of its manufacture. It is now little seen but in those tiles for dairies, called Dutch tiles.

DELIVERY. In every action brought for goods sold, it is incumbent upon the plaintiff to prove that such goods were also delivered, either to the party, his servant, or some person authorized to receive them.

In executing a deed also, a delivery becomes necessary, without which the deed is of no effect.

DEMAND, calling upon a man for any sum or sums of money, or any other thing due. By the several statutes of limitation, debts, claims, &c. are to be demanded and made in time, or they will be lost in law. There are two manners of demands, the one in deed, the other in law. Where there is a duty, which the law makes payable on demand, no demand need be made; but if there is no duty till demand, in such case there must be a demand to make the duty. *1 Lit.* 432. Thus, upon a penalty the party need not make a demand; as if a man be bound to pay 20*l.* on such a day, and in default thereof to pay 40*l.*, the 40*l.* must be paid without demand. If a person release to another all demands, this is the best release the releasee can have,

as he is thereby excluded from all actions, duties, and seizures.

DEMURRAGE, is an allowance made to the master of a ship by the merchants, for being detained in port longer than the time appointed and agreed upon for his departure. The rate of this allowance is generally settled in the charter-party. It is now firmly established, that the claim of demurrage ceases so soon as the ship is cleared out and ready for sailing. *Jameson v. Lawrie, House of Lords, 10 Nov. 1796.*

A general ship took brandies on board under bills of lading, which allowed twenty days for delivery of the goods in London, and stipulated for 4*l.* per day *demurrage*. Afterwards, certain of the consignees choosing to have their goods bonded, the vessel could not make her delivery at the London docks until forty-six days after the twenty days. Some of the goods which were undermost, though demanded, could not be taken out till the upper tiers were cleared. It was held, that each of these consignees were liable for the 4*l.* per day for the forty-six days. *Leer v. Yates, 4 Taunt. R. 387.*

Consignee accepts goods under a bill of lading, on which is a memorandum that the ship is to be cleared in sixteen days, and 8*l.* per day *demurrage* to be paid after that time; the master upon delivery of the goods may recover damages against the consignee. *Jesson v. Jolly, 4 Taunt. R. 52.*

DEMURRER at Law, (in Latin *demorari in lege*, from the Fr. *demurer*,) is an issue upon matter of law.

A demurrer admits the matter of fact, since it refers the law arising on the fact to the judgment of the court; and therefore the fact is taken to be true on such demurrer, or otherwise the court has no foundation on which to make any judgment.

DEMY, or **DEMI**, a sort of white paper, so called by stationers, printers, &c.

DENARIUS, in Roman antiquity, the chief silver coin among the Romans, worth about 7 $\frac{3}{4}$ *d.* sterling. As a weight, it was the seventh part of a Roman ounce.

DENIER, a small French copper coin, of which twelve make a sol. There were two kinds of deniers, the one *tournois*, the other *parisis*, whereof the latter was worth a fourth part more than the former. The denier, now employed in French accounts, is equivalent to $\frac{1}{24}$ *d.* British. See **MONIES**, in the *Appendix*.

DENIZEN. A denizen is an alien-born, who has obtained letters patent, whereby he is constituted an English subject. A denizen is in a middle state, between an alien, and a natural-born or naturalized subject, partaking of the nature of both. He may take lands by purchase; or derive a title by descent through his parents or any ancestor, though they be aliens. By

stat. 25 Geo. 2. c. 39. no natural-born subject shall derive a title through an alien parent or ancestor, unless he be born at the time of the death of the ancestor, who dies seised of the estate which he claims by descent; with this exception, that if a descent shall be cast upon a daughter of an alien, it shall be divested in favour of an after-born son; and in case of an after-born daughter or daughters only, all the sisters shall be coparceners. The children born previous to the denization of their parent cannot inherit by descent, whilst those of a foreigner naturalized are in every respect entitled to the same privileges as British subjects.

DENTALIUM, a kind of shell, used in medicine, when pulverized, as an alkali and absorbent. Its virtues have been long recorded, but the facility with which other articles possessing similar qualities are now obtained, have superseded it in pharmacy.

DENUNCIATION, a solemn publication or promulgation of any thing. All vessels of enemies are lawful prizes, after denunciation or proclamation of war.

DEPARTURE, in navigation, is the easting or westing of a ship in respect of the meridian it departed or sailed from; or it is the difference of longitude, either east or west, between the present meridian the ship is under, and that where the last reckoning or observation was made. This departure, any where but under the equator, must be counted according to the number of miles in a degree proper to the parallel the ship is under. The departure in plane and Mercator's sailing, is always represented by the base of a right-angled plane triangle, where the course is the angle opposite to it, and the distance sailed is the hypotenuse, the perpendicular or other leg being the difference of latitude. And then the theorem for finding it is always this: as radius is to the sine of the course, so is the distance sailed to the departure sought.

DEPOSIT, is a certain sum of money, advanced in part of payment, which is to be accounted for in the general balance; or where it is a security to perform a duty, to be re-delivered when such duty is performed.

When a person bids for the purchase of an article at any sale by auction, it is customary to make a per centage deposit upon the amount; in sales at the India House, also a deposit is required; subscribers to loans to the government also make a deposit; and in all cases where the purchase is not completed, or the condition performed, the deposit which is given as a pledge or security will be forfeited.

DERHEM, a small Persian weight, being one-fifth of a pound.

DESIGN, in manufactories, expresses

the figures with which the workman enriches his stuff, or silk, and which he copies after some painter, or draughtsman, as in diaper, damask, flowered silk, tapestry, carpets, &c. &c.

DETENTS, in clock-work, are those stops which, by being lifted up or let down, lock, or unlock, the clock in striking.

DETENT-WHEEL, or *hoop-wheel*, in a clock, that wheel which has a hoop almost round it, in which there is a vacancy at which the clock locks.

DIAL-PLATE, for a watch, is now generally made of small brass or copper plates, covered with white enamel when wet; the numerals are then marked, and enamel fixed by fire.

Dial-plates for clocks are also japanned in the manner of iron trays, and afterwards painted and marked with the numerals. At Birmingham, Wolverhampton, &c. this description of plates are made; many of them are exported.

DIAL, *Sun*, is a plane, upon which lines are described in such a manner, that the shadow of a wire, or of the upper edge of a plate stile, erected perpendicularly on the plane of the dial, and commonly called a *gnomon*, may show the true time of the day.

DIAMOND, (GER. *Du. Da.* and FR. *Diamant*. SW. *Demant*, *Diamant*. IT. *Sp.* and PORT. *Diamante*. RUS. *Almas*. POL. *Dyament*. LAT. *Adamas*.) is a precious stone, which has been known from the remotest ages. When pure, it is perfectly transparent like crystal, but much more brilliant. Its figure varies considerably; but most commonly it is crystallized in the form of a six-sided prism, terminated by a six-sided pyramid. It is the hardest of all bodies; the best-tempered steel makes no impression on it. Diamond-powder can only be obtained by grinding one diamond against another. Its specific gravity is rather more than 3.5. It is a non-conductor of electricity.

Diamond-mines are found only in the East Indies; and in Brazil, in South America. In the kingdoms of Golconda, Visapour, Bengal, and the island of Borneo, there are four mines; or rather two mines and two rivers, whence diamonds are drawn.

1. The mine of Raolconda, in the province of Carnatic, five days' journey from Golconda, and eight from Visapour, which has been discovered about 200 years. 2. That of Gani, or Colour, seven days' journey from Colconda eastwardly. It was discovered 140 years ago by a peasant, who, digging in the ground, found a natural fragment of twenty-five carats. 3. That of Soumelpour, a large town in the kingdom of Bengal, near the diamond-mine. This is the most ancient of all, and should rather be called that of Goual, which is the name of the river, in the sand whereof these stones

are found. Lastly, the fourth mine, or rather the second river, is that of Succudan, in the island of Borneo.

Diamonds are cut and polished by means of a mill, which turns a wheel of soft iron, sprinkled over with diamond-dust mixed with oil of olives. The same dust, well ground and diluted with water and vinegar, is used in the sawing of diamonds; which is performed with an iron or brass wire, as fine as a hair.

The *first water* in diamonds, means the greatest purity and perfection of their complexion, which ought to be that of the purest water. When diamonds fall short of this perfection, they are said to be of the second or third water, &c. till the stone may be properly called a coloured one: for it would be an impropriety to speak of an imperfectly coloured diamond, or one that has other defects, as a stone of a bad water only.

The mean specific gravity of the Brazil diamonds is said to be 3513; of East India diamonds, 3519; the mean of both, 3517. Therefore, if any thing is to be concluded as to the specific gravity of the diamond, it is, that it is to water as 3517 to 1000.

Suppose the value of a rough diamond to be settled at 2*l.* per carat at a medium; then to find the value of diamonds of greater weights, multiply the square of their weight by 2, and the product is the value required: *c. g.* To find the value of a rough diamond of two carats: $2 \times 2 = 4$, the square of the weight; which multiplied by 2, gives 8*l.* the true value of a rough diamond of two carats. For finding the value of manufactured diamonds, suppose half their weight to be lost in manufacturing them; and therefore, to find their value, we must multiply the square of double their weight by 2, which will give their true value in pounds. Then, to find the value of a wrought diamond weighing two carats, we find the square of double their weight, viz. $4 \times 4 = 16$; then $16 \times 2 = 32$. So that the true value of a wrought diamond of two carats is 32*l.*

The largest diamond ever known, and belonging to the crown of Portugal, was found in Brazil, and uncut was said to weigh 1680 carats; and was valued at 24 millions sterling.

Diamond, brilliant, is that which is cut in faces both at top, and bottom; and whose table, or principal face, at top, is flat. To make a complete square brilliant, if the rough diamond is not found of a square figure, it must be made so; and if the work is perfectly executed, the length of the axis will be equal to the side of the square base of the pyramid. Jewellers then form the table, and collet, by dividing the block or length of the axis into 18 parts. To render a brilliant perfect, each corner of the table-diamond must be shortened by 1-20th of its original. The corner ribs of the upper sides

must be flattened, or run towards the centre of the table 1-6th less than the sides; the lower part, which terminates in the girdle, must be 1-8th of one side of the girdle; and each corner rib of the under side must be flattened at the top to answer the above flattening at the girdle, and at bottom must be 1-4th of each side of the collet. The parts of the small work which complete the brilliant, or the star and skill facets, are of a triangular figure. Both of these partake equally of the depth of the upper sides from the table to the girdle, and meet in the middle of each side of the table and girdle, as also at the corners. Thus they produce regular lozenges on the four upper sides and corners of the stone. The triangular facets, on the under sides, joining to the girdle, must be half as deep again as the above facets, to answer to the collet part. The stone here described is said to be a full-substanced brilliant. If the stone is thicker than in the proportion here mentioned, it is said to be an over-weighted brilliant. If the thickness is less than in this proportion, it is called a spread brilliant. The beauty of brilliants is diminished from their being either over-weighted, or spread. The true proportion of the axis or depth of the stone to its side is as 2 to 3. Brilliants are distinguished into square, round, oval, and drops, from the figure of their respective girdles.

Diamond, Cornish, a name given by many people to the crystals found in digging the mines of tin in Cornwall. These crystals are of the nature of the Kerry-stone of Ireland, but somewhat inferior to it. They are usually bright and clear, except towards the root, where they are coarse and foul, or whitish. They are usually found in the common form of an hexangular column, terminated at each end by an hexangular pyramid.

Diamond, rose, is one that is quite flat underneath, with its upper part cut in many little faces, usually triangles, the uppermost of which terminate in a point. In rose-diamonds, the depth of the stone from the base to the point must be half the breadth of the diameter of the base of the stone. The diameter of the crown must be two-thirds of the diameter of the base. The perpendicular, from the base to the crown, must be three-fifths of the diameter of the stone. The lozenges which appear in all circular rose-diamonds, will be equally divided by the ribs that form the crown; and the upper angles or facets will terminate in the extreme point of the stone, and the lower in the base or girdle.

Diamonds and precious stones may be imported duty-free, saving the duty granted to the East India Company on diamonds imported from any place within the limits of their charter. 6 Geo. 2. c. 7. s. 1, 2.

DIAMOND, in the glass-trade, an instru-

ment used for squaring the large plates or pieces; and among glaziers for cutting their glass. These diamonds are differently managed. That used for large pieces, as looking-glasses, is set in an iron ferule, about two inches long, and a quarter of an inch in diameter: the cavity of the ferule being filled up with lead, to keep the diamond firm: there is also a handle of box or ebony fitted to the ferule, and by which it is held.

DIAPER, (GER. *Drell*. DU. *Drel*. DA. *Drejel*. SW. *Drell*, *Drüll*. FR. *Linge ouvré*. IT. *Tela tessuta a opere*. SP. *Manteles alemaniscas*. RUS. *Salfetotschnoe*. POL. *Cynkowate plotno*) a sort of fine flowered linen commonly used in table-cloths, napkins, &c. brought to the finest perfection in the manufactories in the north of Ireland, in Germany, and now in Scotland.

DICE, (GER. *Würfel*. DU. *Taarlingen*. DA. *Terninger*. SW. *Tärningar*. FR. *Dés* (*à jouer*). IT. *Dadi*. SP. and PORT. *Dados*. RUS. *Kosti*. POL. *Kostki*.) amongst gamesters, cubical pieces of bone or ivory, marked with dots on each side of their faces, from one to six, according to the number of faces. Sharpers have several ways of falsifying dice: 1. By sticking a hog's bristle in them, so as to make them run high or low, as they please. 2. By drilling and loading them with quicksilver; which cheat is found out by holding them gently by two diagonal corners; for if false, the heavy sides will always turn down. 3. By filing and rounding them. There is a duty of 1*l.* on every pair of dice. See GAMING.

DICKER, is the quantity or number of ten hides.

DIE, the stamp used in coinage, and the mould by which the faces of buttons, &c. are formed.

DIGESTER, in chemistry, a strong vessel, made of copper or iron, and fitted with a close cover and screws, so as to remain perfectly tight in a considerable degree of heat, whilst water, common air, and the subject of the operation, are contained in it. The cover of the digester should always be provided with a valve to let out a part of the steam, otherwise the vessel will certainly burst, by which it may prove fatal to the by-standers. Of all chemical vessels hitherto invented, the digester seems best calculated for increasing the action of the menstruums. Water, confined in a digester, is susceptible of so much heat as to melt lead; and it is frequently found to melt the solder of lead and tin, with which the copper vessel was held together: hence appears the necessity of using hard solder, made of spelter, or silver and brass, for this purpose; otherwise, the digester cannot contain the water, when much heated, without melting in the joints. In this vessel, fresh ox-bone will be so digested, in the space of a quarter

of an hour, as to become soft and tender, and capable of being cut with a knife; and the water, in which it was boiled, turned into a hard jelly, and a large cake of fat on its surface, when all is properly cooled.

DIGIT, a measure taken from the breadth of the finger. It is properly $\frac{3}{4}$ ths of an inch, and contains the measure of four barley-corns laid breadthwise.

DIMITY, (GER. *Bombasin*. DU. *Bome-syn*. DA. *Kipper*. SW. *Kipper bomull*. FR. *Basin*. IT. *Dobletto*. SP. *Dimite*. PORT. *Fustão*. LAT. *Xylinum*.) a species of cross-barred stuff entirely composed of cotton, similar in fabric to fustian. Dimity has usually several longitudinal stripes or cords, which in the weaving are raised just above the surface of the piece. These cords are generally about the thickness of small twine, though they are occasionally thinner and sometimes thicker.

Single-corded dimities, are those whose stripes are narrow and round; in the *broad striped dimities* they are flatter and broader.

The manufacture of dimities was first established at Lyons, about 1580, and for several years the French supplied us with the article; but since the introduction of the manufacture into Manchester, we have had no occasion to seek abroad for what we have in such abundance and perfection at home.

Dimities of every description are imported from the East Indies, and immense quantities are frequently put up at the Company's sales.

DINAR, a Persian word, signifying sometimes all sorts of gold coins, and at other times a small imaginary specie, worth $\frac{8}{24}$ ths sterling.

DINAR CHERAY, a Persian weight of the value of a dollar, or golden ducat.

DING, a general name for all weights at Siam. There are scarcely any others here separate from the coins, though this is only to be understood of the silver ones, gold having no currency here as money, but is bought and sold as a merchandise, and is worth twelve times as much as silver. The weights of Siam, that have the same name as its money, are the cali or schang, the mayon, the fouan, sompaye, paye, and clam.

DIPPING, among miners, signifies the interruption, or breaking off, of the veins of ore; an accident that gives them a great deal of trouble before they can discover the ore again.

DISCOUNT, in commerce, a term used among traders, merchants, and bankers. It is used by the two former on occasion of their buying commodities on the usual time of credit, with a condition that the seller shall allow the buyer a certain discount at the rate of so much per cent. per annum, for the time for which the credit is generally given, upon condition that the buyer pays

ready money for such commodities, instead of taking the credit. And with bankers, *discount* is the interest which they deduct from bills of exchange and promissory notes when they give cash for them, taking the *discount* for as many days as such bills and notes have to run, before they become due, at the rate of five per cent. per annum. In Ireland, the legal interest or discount is 6 per cent. per annum, yet the bank of Ireland discounts bills and notes at 5 per cent. per annum. In discount consists one of the principal profits of banking.

DISHONOUR, an expression made use of when bills of exchange, &c. are refused acceptance or payment. Such bills, &c. are frequently taken up under an *act of honour*, by any third person, to save the credit of some of the parties concerned, whereby he who takes up such bills, &c. under this *act of honour*, properly done by a notary public, and regular notice thereof served immediately upon all the parties as drawer, acceptor, and indorsors, holds all bound to him for reimbursement. See **BILLS OF EXCHANGE**.

DISTAFF, an instrument about which flax is tied in order to be spun.

DISTILLATION. The objects of distillation, considered as a trade, are chiefly spirituous liquors, and those waters impregnated with the essential oils of plants, commonly called simple distilled waters. The distillery of compound spirits and waters is reckoned a different branch of business, and those who deal in that way are commonly called rectifiers. This difference, however, though it exists amongst commercial people, is not at all founded on the nature of the thing; compound spirits being made, and simple spirits being rectified, by the very same operations by which they are first distilled, or at least with very trifling alterations.

Distillation is therefore the process of evaporating the volatile parts of bodies by means of heat, performed in vessels adapted to condense or collect the substance evaporated.

Distillation is carried on in an apparatus composed of three parts: the alembic, or boiler in which the substance is heated; the head, or capital, a dome-shaped continuation of the former, in which the vapours are collected; and a tube or worm, spirally disposed, and passing through a tub of water, in which the distilled vapour is condensed into a liquid.

The chief objects to which this process is applied, are to obtain the spirit in a state of purity, which is formed during the fermentation, either of vinous liquors, or of malt; and the aromatic principles of plants diffused in water.

We shall give a general description of the processes required for each of the above purposes, as distillation forms no inconsiderable feature in commerce, and there are some peculiarities to be attended to, distinctively.

In the distillation of vinous liquors, the product of which is termed brandy, the alembic is first filled to about five-sixths of its capacity with wine, and the fire kindled beneath it. When the wine nearly boils, the capital is put on, and all the joinings luted, or stopped up with a mixture of clay and ashes. A stream of brandy soon pours out from the lower end of the worm-pipe, into a cask set to receive it. The fire at first must be slow, otherwise the wine boils up into the capital, and part passes the worm and fouls the spirit. What first comes over is the richest in flavour, and the strongest spirit; but the liquor gradually decreases in strength as the process continues, and at last contains so little spirit, as to be almost devoid of taste. When this happens, the fire is put out, and the contents left in the alembic are thrown away as useless: these may be known to be exhausted of spirit, by taking a little of the distilled liquor then running over, putting it on the hot part of the capital, and applying a lighted stick; if the vapour does not catch fire, the liquor is little else than water.

The *emphyreuma*, or burnt taste, is a frequent defect in all distilled liquors, and very notably so in the common brandies. This has been attributed, in general, to the burning of some of the vegetable particles contained in the liquid; but others have supposed it to be owing to the decomposition of the *malic acid* existing in it. The addition of chalk, alkali, or lime-water to the wine, remedies this very effectually, and renders the spirit much purer; but from some cause, not easy to understand, it remarkably diminishes the total quantity of product.

Another substance which gives a strong, and generally a very unpleasant, flavour to brandy, is an essential oil, of a peculiar nature, found most abundantly in the richest and fullest-bodied wines; which is altered by the process, so as to become highly nauseous. When the brandy is much loaded with this oil, it is usual to add a sufficient quantity of water, and re-distil it.

The greater part of the common spirituous liquors consumed in this, and other, countries of Europe, where the vine is not grown for the purpose, is prepared from fermented corn, of one kind or other, mixed occasionally with molasses, and sometimes with carrots, and other saccharine vegetables. The spirit thus procured is rectified for sale, and termed *whisky*; or is re-distilled with juniper-berries, turpentine, and many other substances, to give it the desired flavour, and appearance.

It is not necessary to malt grain in order to make it ferment sufficiently to yield a good spirit; and not only barley, but any other grain will answer the same purpose. In this country, a mixture of barley and

malt is generally preferred; in Holland, the finest *geneva* is made from wheat and malt, but more commonly from malt and rye, which latter yields more spirit than wheat. Buck-wheat has lately been much cultivated in England for the purpose of distillation, being found to yield a very large quantity of spirit.

The following is the process usually adopted by distillers. A quantity of rye-flour, coarsely ground, is mixed with a third or fourth part of malt, and put into the fermenting tub with cold water, stirring it well with the hands, to prevent the meal from clotting. Sufficient water is then added of a blood warmth; after which the ferment is mixed with the whole, which is composed of the yeast of former operations, dried and kept for a certain length of time. If the weather be favourable, and the heat well regulated, the fermentation begins in six hours, and terminates on the third day, when the liquor becomes transparent, and assumes a hot pungent taste. The distillation is then proceeded upon immediately, before the liquor turns sour, which is avoided as much as possible. The distillation is conducted very slowly, that the spirit may be as little as possible impregnated with the oil of the grain. The first spirit is then rectified by a second distillation, and is termed, when pure, *spirit of wine*; or it is distilled the second time from juniper-berries, when it is called *geneva*. In some instances, the juniper-berries are mixed with the fermenting materials, and one distillation suffices. In the common gin of this country, the flavour of the juniper is imitated by turpentine.

The distillers in Scotland generally proceed in the following manner:—The grain, if barley be used, is generally first malted in the usual manner, and dried with peat, the smoke of which gives that peculiar flavour found in *whisky*, the spirit distilled from it. It is then ground to coarse powder, mashed, and the infusion fermented with yeast, in large tuns. The fermented liquor, termed *wash*, is then fit for the first distillation.

Rum is prepared by distilling a fermented liquor made from molasses, and other refuse saccharine matter, which is procured during the manufacture of sugar in the West Indies. The following is the process employed in Jamaica:—the materials for fermentation are, molasses, scummings of the hot cane-juice, or sometimes raw cane liquor, lees, or *dunder* as it is called, and water. The *dunder* answers the purpose of yeast, and is usually prepared by a separate fermentation of cane, sweets, and water. The materials being mixed in due proportions, (which are about equal parts of scummings, *dunder*, and water,) the fermentation soon begins, and in twenty-four hours the liquor is fit for the first charge of molasses, which

is added in the proportion of three gallons for every hundred gallons of the liquor. Another charge is added in a day or two, or afterwards. The heat in fermentation should not exceed ninety, or ninety-four degrees. The fermentation falls in six or eight days, and the liquor grows fine and fit for distillation. In about two hours after lighting the fire the spirit begins to run (in a still of 1200 gallons), and it is collected as long as it is inflammable. The first spirit is called, in the country, *low wines*, and it is rectified in a smaller still to the Jamaica proof, which is that in which olive oil will sink.

In the distillation of *aromatic waters*, no further process is required than to put the vegetable substance in the alembic, with sufficient water to prevent its burning throughout the operation. The fire is then applied, which should be only just sufficiently powerful to keep the liquor at the boiling point. The distilled water is collected as long as it retains any flavour. Where a water-bath is used for the reception of the alembic, (which, however, is tedious, and seldom if ever necessary,) all danger of excess of heat is avoided, but it is often requisite to increase the heat of the bath, by adding salt to the water.

A considerable quantity of essential oil passes over from many vegetables, which may be separated by letting the water stand for a few hours, and then passing it gently through a tunnel.

Distilled spirituous waters are obtained in the same way, only a proportionate quantity of spirit must be put into the alembic previously to the application of the fire.

DISTILLER, he who makes distillations, and commonly a tradesman who makes spirits from malt, &c.

Distillers may be divided into three classes; viz. 1st, Malt. 2d, Compound-distillers, who add juniper-berries, aniseeds, or other ingredients to the malt-spirits. 3d, The distillers of molasses or treacle.

Every distiller must take out a licence at the Excise-office, and renew the same annually.

Distillers or their servants are prohibited selling any spirituous liquors to be drunk in their shops, houses, or other places belonging thereto. They are to make entries at the Excise-office, to permit gaugers, on request, to enter and take accounts of commodities made or making; are not to have any stills in their custody containing less than 100 gallons; nor wash-stills, containing less than 400 gallons; nor low wine-stills, containing less than 100 gallons; nor private pipes, &c. under penalties by the laws of Excise. The provisions on this subject are much too numerous to be inserted here, being only for the purpose of preventing

frauds on the revenue. Suffice it, therefore, to notice, that the last statute on the subject is 57 Geo. 3. c. 128., by which the whole process, so far as respects the revenue, is regulated.

DISTRESS is of two kinds, viz. Distress for trespass, as cattle doing damage upon the premises of another, or distress for rent, which is a remedy given by law to a landlord, to seize the goods of his tenant upon the premises, to sell the same within a certain period, and to re-imburse himself for the rent in arrear, and the charges consequent upon the distress.

Rent in arrear may be distrained for, though the lease whereon it is reserved be determined, so as that such distress be made within six months after such lease has expired, and during the continuance of the landlord's title and the tenant's possession.

A distress may be taken of all goods and chattels personal found on the demised premises, whether they be the property of a tenant, or of a stranger; but money cannot be distrained unless in a bag; nor dogs, deer, conies, &c.; nor things fixed to the freehold; as, chimney-pieces, anvils, mill-stones, &c.

Neither can any thing be distrained that is in the actual use of another; as, a horse which a man is riding, the tools he is working with; the goods of a carrier are also privileged; and the tools and implements of a man's trade, as, the books of a scholar, the axe of a carpenter, the loom of a weaver, &c.: but it has been recently held, that the implements of a man's trade are no longer privileged than whilst he is actually using them, and so long as there is any other distress upon the premises.

Wearing apparel cannot be distrained upon the person of the owner.

When distress is made, notice of the place where the goods are lodged shall, within one week after the lodging thereof, be given to the tenant, or left at the place of his abode.

Although it is a general rule of law, that the landlord may distrain every thing he finds on the premises; there are nevertheless several exceptions for the benefit of trade; as, cloth in a tailor's shop, yarn in a weaver's, or a horse in a smith's.

Every distress for rent must be made in the day-time, and on the day after the rent becomes due, and no distress can be made after the arrears are tendered.

Where there is not a sufficient distress on the premises, or the landlord mistakes in the value of the things distrained, and takes too little, he or his executors or administrators may take a second distress.

No outer door can be broken open to make a distress: landlords may follow the goods of a tenant fraudulently removing to prevent distress, within 30 days next after

such goods shall be so removed away; and the tenant so removing these shall forfeit double the value.

Upon oath, of a reasonable suspicion that any goods are concealed in any house or place fastened, to prevent a distress, the landlord, with the assistance of a peace-officer, or other officer of the parish, may break open, in the day-time, the place where such goods are suspected to be concealed, and seize such goods for rent in arrear, in the same manner as if they had been in any open field or place.

How to make a distress for Rent in Arrear, and of the Sale of the same.

The landlord himself, or any other person, as his bailiff, by an authority from him in writing, may make the distress. The warrant or authority may be in the following form:

To Mr. A. B. my bailiff, greeting. Distrain the goods and chattels of C. D. (the tenant), in the house he now dwells in, or on the premises in his possession, situated in ———, in the county of ———, for ——— pounds, being ——— rent due to me for the same, at ——— day last: and for your so doing, this shall be your sufficient warrant and authority. Dated the ——— day of ———.

J. C.

Being legally authorized to distrain, you enter on the premises, and make a seizure of the distress; if it be made in a house, seize a chair or other piece of furniture, and say, "I seize this chair in the name of "all the goods in this house, for the sum of "—— pounds, being ——— rent due to me, "or to J. C. the landlord, at ——— last "past, by virtue of an authority from the "said J. C. for that purpose (provided you "distrain as bailiff)."

Then take an inventory of so many goods as you judge will be sufficient to cover the rent distrained for, as also the charges of the distress, and make a copy thereof as follows:

AN INVENTORY of the several goods and chattels distrained by me, A. B. this ——— day of ———, in the year of our Lord ———, in the houses, outhouses, and lands (as the case is) of C. D. situate in ———, in the county of ———, by the authority and on the behalf of J. C. (provided you distrain as bailiff), the sum of ——— pounds, being ——— rent due to me, or to the said J. C. (as the case is) at ——— last.

In the dwelling-house, two tables, two chairs, &c.

In the barn, six hurdles, and so on.

At the bottom of the inventory subscribe the following notice to the tenant:

Mr. C. B.

TAKE NOTICE, That I have this day dis-

trained (or that as bailiff to J. C. your landlord, I have this day distrained), on the premises above-mentioned, the several goods and chattels specified in the above inventory, for the sum of ——— pounds, being ——— rent due to me, or to the said J. C., at ——— last, for the said premises; and that unless you pay the said rent, with the charges of distraining for the same, within five days from the date hereof, the said goods and chattels will be appraised and sold according to law. Given under my hand this ——— day of ———, in the year of our Lord ———.

W. T.

A true copy of the above inventory and notice must either be given to the tenant himself, or left at his house; or, if there be no house, on the most conspicuous place on the premises; and it is proper to have a person with you when you make the distress, and also when you serve the inventory and notice, to examine the same, and to attest the regularity of the proceedings.

The goods may be removed immediately, and in the notice the tenant may be acquainted whither they are removed; but it is now most usual to put a man into possession, and let him remain on the premises till you are entitled by law to sell them, which is on the sixth day, inclusive, after the distress made, (that is,) goods distrained on the Saturday may be removed and sold on the Thursday afternoon following.

If the tenant require further time for the payment of the rent, and the landlord choose to allow it, it is best to take a memorandum, in writing, from the tenant, "That he does consent that he should continue in possession of his goods and chattels in his house, or upon the premises, "for such a time longer, you having agreed "not to sell them for that time, and that he "will pay the expenses of keeping possession." This memorandum prevents the landlord from being deemed a trespasser, which, after the expiration of five days, he otherwise would be, and might have an action of trespass brought against him for staying longer upon the premises.

If there is no allowance of, or agreement for, further time, search at the expiration of the five days at the sheriff's office, to see if the goods have been replevied; if not, and the rent and charges still remain unpaid, send for a constable and two sworn appraisers, who, having viewed the goods, the former must administer to the latter the following oath:

You, and each of you, shall and will well and truly appraise the goods and chattels mentioned in this inventory (holding it in his hand), according to the best of your judgment—So help you God.

Then indorse on the inventory the following:

MEMORANDUM, that on the — day of —, in the year of our Lord —, A. B. of, &c. and C. D. of, &c. two sworn appraisers, were sworn upon the Holy Evangelists, by me, J. K. of, &c. constable, well and truly to appraise the goods and chattels mentioned in this inventory, according to the best of their judgment. As witness my hand,

J. K. Constable.

Present at the time of swearing the said A. B. and C. D. as above, and witnesses thereto,

L. M.

O. P.

After the appraisers have valued the goods, continue the indorsement on the inventory as follows :

WE, the above-named A. B. and C. D. being sworn upon the Holy Evangelists, by J. K., the constable above-named, well and truly to appraise the goods and chattels mentioned in this inventory, according to the best of our judgment, and having viewed the said goods and chattels, do appraise the same at the sum of — pounds. As witness our hands this — day of —, in the year of our Lord —

A. B. }
C. D. } Sworn Appraisers.

By 11 Geo. 2. c. 19. a remedy was given to landlords to recover possession of deserted premises after twelve months, before justices of the peace, where nothing was left on which to take distress.

By 57 Geo. 3. c. 52. further relief was given on this subject ; and by the latter statute, the broker who appraises the goods and distrains for the landlord, where the sum does not exceed 20*l.*, is laid under specific restrictions as to his charges, to be cognizable before justices of the peace. See *ante*, title BROKER ; and 3 *Dick. Pract. Expos.* 226.

DISTRIBUTION, in legal language, is generally applicable to the disposition which the law makes of the estates of intestates. This differs in the two provinces, into which the ecclesiastical polity of the realm is divided, viz. Canterbury, and York.—For the particulars of these customs, see 2 *Burn's Ecc. Law*, 746. and 2 *Black. Com.* 515.

DISTRIBUTION, in printing, the taking of a form asunder, separating the letters, and dispersing them in the cases again, each in its proper box.

DIVIDEND of *Stock*, is a share or proportion of the interest of stocks erected in public funds, as the South Sea, &c. divided among, and paid to, the proprietors half yearly. See STOCKS.

DIVISION, in arithmetic, the separation or parting of any number or quantity given, into any parts assigned.

DIVISION, in the sea language, the third part of a fleet of men of war, and

sometimes the ninth part: which last happens when the fleet is divided into three squadrons; for then each squadron is distributed into three divisions.

DOCK, in maritime affairs, is an artificial basin, by the side of a harbour, made convenient either for the building or repairing of ships. It is of two sorts: 1. *Dry dock*, where the water is kept out by great flood-gates, till the ship is built or repaired, when the gates are opened, and the water let in to float and launch her. 2. *Wet docks*, a place into which the ship may be hauled, out of the tide's way, and so dock herself, or sink for herself a place to lie in.

The *West India Docks*, in the Isle of Dogs. These immense works are intended to receive the whole of the ships in the West India trade; and may be accounted among the prominent curiosities of British commerce. They were undertaken according to an act of parliament, passed 1799, entitled "The West India Dock Act." The entrances to them are at Blackwall and Limehouse-hole; their scite is wholly on the Isle of Dogs; and upon the wharfs and quays adjoining them, all the West India ships are to unload and load their cargoes. The northern dock for unloading inwards covers a space of thirty acres, and is capable of containing from 2 to 500 sail of ships.

The smaller dock, situated to the south of the other, covers an area of 24 acres, and is devoted solely to the business of loading outwards. Both docks are surrounded by a chain of immense warehouses. The proprietors of this capital improvement are styled "*The West India Dock Company*." They commenced their undertaking with a subscription of 500,000*l.* and are empowered to increase it to 600,000*l.* if needful. They are reimbursed by a tonnage of 6*s.* upon the burthen of every ship which enters the docks; for wharfage, landing, heaving, weighing, cooperage, and warehouse-room, they are entitled to certain rates upon all goods that are discharged, such as 8*d.* per cwt. upon sugar; 1*d.* per gallon upon rum; 1*s.* 6*d.* per cwt. upon coffee; 2*s.* 6*d.* per cwt. upon cotton-wool, &c.

The *Docks at Wapping*, called also the *London Docks*. This important improvement is made in the angle formed by the Thames between Hermitage dock and Shadwell dock. One immense dock, called St. George's dock, covers the space extending from Virginia-street, almost to Old Gravel-lane, in one direction, and in the other from Artichoke-lane to the south side of Pennington-street. This dock alone is capable of holding 200 ships, with room for shifting.

Another dock, called Shadwell Dock, adjoining to the other, will hold about fifty ships. The entrance to the docks is from

the Thames by three basons, capable of containing an immense quantity of small craft : and the inlets from the Thames into the basons are at the Old Hermitage dock, at the Old Wapping dock, and Old Shadwell dock.

The capital of the company is 1,200,000*l.* sterling. The warehouses for the reception of tobacco are situated at the eastern extremity : they are two in number. The largest is 762 feet long, and 160 feet wide, equally divided by a strong partition-wall with double iron doors : the smallest is 250 feet by 200. Both of them consist of a ground-floor and vaults ; the first is to be wholly applied to the reception of tobacco ; the cellars in the smaller warehouses are appropriated to the housing of wine. They are solely under the care and controul of the officers of the customs : the proprietors of the docks having nothing more to do with them than to receive the rent.

Besides these docks, those of *Liverpool, Hull, Dublin, &c.* are of very great consequence.

DOCK-YARDS, are magazines of all sorts of naval stores. The principal in England are those of Chatham, Portsmouth, Plymouth, Woolwich, Deptford, and Sheerness. In time of peace, ships of war are laid in these docks : those of the first rate mostly at Chatham, where, and at other yards, they receive, from time to time, such repairs as are necessary. These yards are generally supplied from the northern parts of Europe with hemp, pitch, tar, resin, &c. but the best masts, particularly those of the larger size, are brought from America.

DOGGER, a small ship built after the Dutch fashion, with a narrow stern, and commonly with but one mast.

DOILEY, a kind of woollen stuff, so called, as it is supposed, from the name of the first maker. Doiley is also applied to small, square, folded cloths, placed on dinner-tables with the wine glasses, after the removal of the dinner cloth ; and which, probably, received that appellation from a similar fortuitous source.

DOLLAR, a foreign coin, worth about 4*s.* 6*d.* sterling. See MONIES, in the *Appendix*.

DONATIO MORTIS CAUSA, a death-bed disposition of property, so called, viz. when a person in his last sickness, apprehending his dissolution near, delivers or causes to be delivered to another the possession of any personal goods, (under which have been included bonds, and bills drawn by the deceased upon his banker,) to keep in case of his decease. This gift, if the donor dies, needs not the assent of his executor ; yet it shall not prevail against creditors ; and is accompanied with this implied trust, that if the donor lives, the property thereof shall revert to himself, being only given in con-

templation of death, or *mortis causa*. 2 *Black. Com.* 514.

DOOSOOTIES, a species of East India calico.

DOREAS, a sort of fine India muslin.

DOTTES, an Indian calico or muslin.

DOUBLOON, a Spanish and Portuguese coin, being the double of a pistole, worth about 1*l.* 8*s.* 8*d.* sterling. See MONIES, *Appendix*.

DOUDOU, a copper money, current in some parts of the East Indies, particularly at Surate and Pondicherry : fourteen of them make a gold fanon of those places, equal to about six sols tournois, or 3*d.* sterling. *Id.*

DOVE-TAILING, in carpentry, is the manner of fastening boards together by letting one piece into another, in the form of the tail of a dove. The dove-tail is the strongest of the assemblages or jointings, because the tenon, or piece of wood which is put into the other, goes widening to the extreme, so that it cannot be drawn out again, because the extreme or tip is larger than the hole.

DOWLAS, a sort of coarse linen cloth, manufactured principally in the north of Ireland, Lancashire, &c.

DOWN, (*GER.* *Dunen*, *Flaumfedern*. *Du.* *Dons*. *DA.* *Duun*. *Sw.* *Dun*, *Tjun*. *Fr.* *Duuet*. *It.* *Penna matta*, *Piumini*. *Sr.* *Flojel*, *Plumazo*. *Port.* *Frouzel*. *Rus.* *Puch*. *Pol.* *Puchy*. *LAT.* *Plumae*.) the fine feathers from the breasts of several birds, particularly that of the duck kind. That of the eider duck is the most valuable. These birds pluck it from their breasts and line their nests with it. Three pounds of this down may be compressed into a space scarcely larger than one's fist, yet is afterwards so dilatable as to fill a quilt five feet square. That found in the nest is most valued, and termed *live down* ; it is infinitely more elastic than that plucked from the dead bird, which is little esteemed in Iceland. The best sort is sold at 45 fish per pound when cleansed, and at 16 when not cleansed. There are generally exported every year, on the Iceland company's account, 1500 to 2000*lb.* weight of both sorts, exclusive of what is privately exported by foreigners.

DOZEN, the number of twelve. Bottled wine, porter, cider, &c. are usually sold by the dozen ; it is customary to give thirteen bottles to the dozen of Portuguese and Spanish wines ; but of Burgundy and fine French wines only twelve.

DRAW, is a sort of thick woollen cloth, woven purposely for great coats, and it is sometimes double-milled. This kind of cloth is manufactured in Yorkshire, and also in many parts of the west of England in the greatest perfection. See CLOTH.

DRAWLE, in the sea language, a small sail in a ship, which is the same to a bonnet, as a bonnet is to a course, and is only used

when the course and bonnet are too shoal to clothe the mast.

DRABS, in the salt-works, a kind of wooden boxes for holding the salt when taken out of the boiling-pan. The bottoms of them are made shelving or inclining forwards, that the briny moisture of the salt may drain off.

DRACHM, a Grecian coin of the value of seven-pence three farthings. *Drachm* is also a weight used by apothecaries, &c. containing just sixty grains three scruples, the eighth part of an ounce.

DRAFT or **DRAUGHT**, in commerce, called also *cloff* or *clough*, is a small allowance on goods sold by weight, made by the king to the importer, or by the seller to the buyer, that the weight may hold out when the goods are weighed again. The king allows one pound draft for goods weighing less than one hundred weight; two pounds for goods weighing between one and two hundred weight; three pounds for goods weighing between two and three hundred weight; four pounds, from three to ten hundred weight; seven pounds, from ten to eighteen hundred weight; nine pounds, from eighteen to thirty hundred weight or upwards.

Draft or *Draught* is also a common colloquial term for a bill of exchange.

DRAG, in sea language, is a machine consisting of a sharp square iron ring, encircled with a net, and commonly used to take the wheel off from the platform or bottom of the decks.

DRAGOMAN, or **DROGMAN**, a term of general use through the East for an interpreter, whose office is to facilitate commerce between the orientals and occidentals. These are kept by the ambassadors of Christian nations residing at the Porte for this purpose.

DRAGON'S BLOOD, (GER. *Drachenblut*. DU. *Draakenbloed*. DA. *Drageblod*. SW. *Drakblod*. FR. *Sang-dragon*. IT. *Sangue di drago*. SR. *Sangre de drago*. PORT. *Sangue de drago*. RUS. *Drakonowa Krow*. POL. *Smocza Krew*. LAT. *Sanguis draconis*.) a gummy resinous substance so called, which is brought from the East Indies, either in oval drops wrapped up in flag leaves, or in large masses composed of smaller tears. It is obtained from the *palmijuncus draco*, the *calamus rotang*, the *dracena draco*, the *pterocarpus draco*, and several other vegetables. It is at present very little used in medicine. A solution of dragon's blood in spirit of wine is used for staining marble, to which it gives a red tinge, which penetrates more or less deeply, according to the heat of the marble during the time of application. But as it spreads at the same time that it sinks deep, for fine designs the marble should be cold. M. du Fay says, that by adding pitch to this solution the colour may be rendered deeper.

DRAM, See **DRACHM**.

DRAPER, a name given to a person who sells either linen or woollen cloth, as *Linen-draper*, *Woollen-draper*, &c.

DRAPERY, in commerce, signifies linen or woollen cloth, &c. and in sculpture or painting, the representation of the clothing of human figures, and also hangings, tapestry, curtains, and most other things that are not figures or landscapes.

DRAW, in the sea language. A ship is said to draw so much water, according to the number of feet she sinks into it; so that if a ship sinks into the water 18 feet perpendicularly, she is said to draw 18 feet water; and according as she draws more or less, she is said to be of greater or less draught.

DRAWBACK, in commerce, certain duties, either of the customs or of the excise, allowed upon the exportation of some of our manufactures, or upon certain merchandise that has paid duty upon importation. The oaths of the merchants importing, and exporting, are required to obtain the drawback on foreign goods, affirming the truth of the officer's certificate of the entry, and the due payment of the duties; and these may be made by the agent of any corporation or company, or by the known servant of any merchant, usually employed in making his entries and paying his customs.

In regard to foreign goods entered outwards, if less quantity or value is fraudulently shipped out than is expressed in the exporter's certificate, the goods mentioned in it, or their value, are forfeited, and no drawback allowed. Foreign goods exported by certificate, in order to obtain the drawback, if they are not shipped or exported, or if they are reloaded, in Great Britain, unless in case of distress, to save them from perishing, are to lose the benefit of the drawback, and are forfeited, all their value, with the vessels, horses, carriages, &c. employed in relanding them; and the persons employed in the relanding, or by whose privity they are reloaded, or into whose hands they shall knowingly come, are to forfeit double the amount of the drawback.

Officers of the customs conniving at, or assisting in any fraud relating to certificated goods, besides other penalties, are to forfeit their office, and to suffer six months' imprisonment, without bail or mainprize; as are also masters, or persons belonging to the ships employed therein. Bonds given for the exportation of certificate goods to Ireland, must not be delivered up, nor drawback allowed for any goods, till a certificate under the hands and seals of the collector or comptroller, &c. of the customs is produced, testifying the landing. See **DUTIES** and **DRAWBACKS**, *App.*

DRAWEE, the person on whom Bills of Exchange are drawn. See **BILLS OF EXCHANGE**.

DRAWER, the person who draws a Bill of Exchange. *See* **BILLS OF EXCHANGE**.

DRIFT, in mining, a passage cut out under the earth, betwixt shaft and shaft, or turn and turn; or a passage or way wrought under the earth, to the end of a meer of ground, or part of the meer.

DRIFT, in navigation, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the wind and waves, and is not governed by the power of the helm; it also implies the distance which the ship drives on that line. A ship's way is only called drift, in a storm: and then it blows so vehemently as to prevent her from carrying any sail, or at least restrains her to such a portion of sail, as may be necessary to keep her sufficiently inclined to one side, that she may not be dismasted by the violent labouring produced by the turbulence of the sea.

DRIFT-SAIL, a sail used under water, veering out right a-head by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to hinder her diving too fast in a current.

DRINKING-GLASSES. (*GER.* *Gläser.* *Du.* *Drinkglazen, Glazen.* *DA.* *Glase.* *Sw.* *Dricksglas.* *FR.* *Verres.* *IT.* *Bicchieri.* *SP.* *Vasos y copas.* *PORT.* *Copos, Vidros.* *RUS.* *Stakani.* *POL.* *Sklanki.*) *See* **GLASS**.

DRIVING, in the sea language, is said of a ship when an anchor being let fall will not hold her fast, nor prevent her sailing away with the tide or wind. The best help in this case is to let fall more anchors, or to veer out more cable; for the more cable she has out the safer she rides. When a ship is a-hull or a-try, they say she drives to leeward.

DROMO, a name given to a swift-sailing vessel.

DROVERS, are those who buy cattle in one place to sell in another, and are licensed by stat. 5 Eliz. c. 12. *Drovers* not to be subject to the operation of the bankrupt laws. 5 Geo. 2. c. 30. s. 40.

DRUG, (*Drugs.* *GER.* *Droguerien.* *Du.* *Drogeryen, Drogen.* *DA.* *Specerie.* *Sw.* *Speceri.* *FR.* *Drogues, Droguerie.* *IT.* *Droghe, Drogherie.* *SP.* and *PORT.* *Drogas.* *RUS.* *Prünie Korenja,*) in a commercial sense, is applied to every article of a medicinal nature, such as gums, jalap, senna, &c. It is also used, being probably by corruption for *drag*, an inconvenient weight, to signify any thing without worth or value, or for which no purchaser can be found: thus we say, "such an article is a mere drug in the market."—*Drug* among fan-makers, is a composition of gum-arabic, and some other ingredients, used in the manufacture of fans. *Drug* signifies also a salt

or cinder of glass used in bleaching cloth, but which is prohibited in France.

DRUGGET, a thin and narrow kind of stuff, sometimes all wool, and sometimes half wool, half thread; sometimes corded, but usually plain. The English, Irish, and Dutch, are those most esteemed, being cheap, common, woollen cloths.

DRUGGIST, a dealer in all kinds of uncompound drugs, both foreign and domestic: most druggists compound drugs for sale in their own shops, the same as apothecaries do. The druggists as well as apothecaries are under the inspection of the college of physicians, but the former are specially excepted out of the provisions for the regulation of apothecaries by statute 55 Geo. 3. c. 194.

DRUMS, (*GER.* *Trommeln.* *Du.* *Trommels.* *DA.* *Trommer.* *Sw.* *Trommor.* *FR.* *Tambours, Caisses.* *IT.* *Tamburi, Casse.* *SP.* *Tambores.* *PORT.* *Caxas, Tambores.* *RUS.* *Barabanü.* *POL.* *Bebny,*) a martial, musical instrument in form of a cylinder, hollow within, and covered at both ends with vellum, which is stretched or slackened at pleasure by means of small cords and sliding knots. The bodies of some drums are made of brass, but they are usually of wood.

DRY-SALTER, is a wholesale dealer in all sorts of colours for dyers' use, as indigoes, cochineal, alum, galls, &c.

DUCAT, a coin current in Germany and other countries abroad, for the different values of which, *see* **MONIES**, *App.*

DUCATOON, a silver coin, struck chiefly in Italy; though there are *ducatons* in Holland and Flanders, value about 4s. 8d. sterling. *Idem.*

DUCKS, a sort of strong brown cloth, used chiefly by sail-makers; the best is manufactured in Russia.

DUCK-UP, at sea, is a term used by the steersman when the mainsail, foresail, or spritsail hinders his seeing to steer by a land mark; upon which he calls out, "Duck the clew-lines of these sails," that is, hale the sails out of the way. Also when a shot is made by a chace-piece, if the clew of the spritsail hinder the sight, they call out, "Duck up, &c."

DUNG, a small Persian weight, 1-6th of a mescal, and of which about 3600 go to the small batman of Persia, called the batman of Tauris, and near 7200 to the great, or king's batman.

DUNG is also a silver coin, made and current in Persia, weighing twelve grains.

DUNGARES, a species of calico, manufactured at Surate, in pieces of fourteen ells in length, and in breadth 3-4ths of an ell.

DUODECIMO, among booksellers, &c. is a sheet of paper folded so as to form 12 leaves.

DURESSE, in law, a plea used by way of exception, by him who being cast into prison at a man's suit, or otherwise by threats, &c. hardly used, seals any bond to him during his restraint.

DUTY, in policy and commerce, signifies the impost laid on merchandises, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp duties, &c. See **CUSTOMS**, and **EXCISE**. For **DUTIES** and **DRAWBACKS**, see *App.*

DYEING or **DYING**. *Principles of dying.*—The substances commonly employed for clothing may be reduced to four; namely, wool, silk, cotton, and linen. Permanent alterations in the colour of cloth can only be induced two ways; either by producing a chemical change in the cloth, or by covering its fibres with some substance which possesses the wished-for colour. Recourse can seldom be had to the first method, because it is hardly possible to produce a chemical change in the fibres of cloth, without spoiling its texture. The dyer, therefore, when he wishes to give a new colour to cloth, has recourse to the second method. The substances employed for this purpose are called colouring-matters, or dye-stuffs. They are for the most part extracted from animal, and vegetable, substances, and have usually the colour which they are to give to the cloth. Since the particles of colouring matters with which the cloth, when dyed, is covered, are transparent, it follows, that all the light reflected from dyed cloth must be reflected, not by the dye-stuff itself, but by the fibres of the cloth below the dye-stuff. The colour therefore does not depend upon the dye alone, but also upon the previous colour of the cloth. If the cloth is black, it is clear that we cannot dye it any other colour whatever; because as no light in that case is reflected, none can be transmitted. Hence the importance of a fine white colour, when cloth is to receive bright dyes. It then reflects all the rays in abundance, and therefore any colour may be given, by covering it with a dye-stuff which transmits only some particular rays. If the colouring matters were merely spread over the surface of the fibres of cloth by the dyer, the colours produced might be very bright, but they could not be permanent; because the colouring matter would be very soon rubbed off, and would totally disappear whenever the cloth was washed, or even barely exposed to the weather. The colouring matter then, however perfect a colour it possesses, is of no value, unless it also adheres so firmly to the cloth, that none of the substances usually applied to cloth, in order to clean it, &c. can displace it. Now this can only happen, when there is a strong affinity between the colouring matter and the cloth, and when they are actually combined toge-

ther, in consequence of that affinity. Dyeing then is merely a chemical process, and consists in combining a certain colouring matter with the fibres of cloth. This process can in no instance be performed, unless the dye-stuff is first reduced to its integrant particles; for the attraction of aggregation between the particles of dye-stuffs, is too great to be overcome by the affinity between them and the cloth, unless they could be brought within much smaller distances than is possible while they both remain in a solid form. It is necessary, therefore, previously to dissolve the colouring matter in some liquid or other, which has a weaker affinity for it than the cloth has. When the cloth is dipped into this solution, the colouring matter, reduced by this contrivance to a liquid state, is brought within the attracting distance; the cloth therefore acts upon it, and from its stronger affinity takes it from the solvent, and fixes it upon itself. By this contrivance too, the equality of the colour is in some measure secured, as every part of the cloth has an opportunity of attracting to itself the proper proportion of colouring particles. The facility with which cloth imbibes a dye, depends upon two circumstances; namely, the affinity between the cloth and the dye-stuff, and the affinity between the dye-stuff and its solvent. It is directly as the former, and inversely as the latter. It is of importance to preserve a due proportion between those two affinities, as upon that proportion much of the accuracy of dyeing depends. If the affinity between the colouring matter and the cloth is too great, compared with the affinity between the colouring matter and the solvent, the cloth will take the dye too rapidly, and it will be scarcely possible to prevent its colour from being unequal. On the other hand, if the affinity between the colouring matter and the solvent is too great, compared with that between the colouring matter and the cloth, the cloth will either not take the colour at all, or it will take it very slowly and faintly. Wool has the strongest affinity for almost all colouring matters, silk the next strongest, cotton a considerably weaker affinity, and linen the weakest affinity of all. In order, therefore, to dye cotton or linen, the dye-stuff should in many cases be dissolved in a substance for which it has a weaker affinity than for the solvent employed in dyeing wool, or silk. Thus we may use oxyd of iron dissolved in sulphuric acid, in order to dye wool; but for cotton and linen, it is better to dissolve it in acetic acid. Were it possible to procure a sufficient number of colouring matters having a strong affinity for cloth, to answer all the purposes of dyeing, that art would be exceedingly simple and easy. But this is by no means the case; if we except indigo, the dyer is scarcely possessed of a

dye-stuff which yields of itself a good colour, sufficiently permanent to deserve the name of a dye. This difficulty, which at first sight appears insurmountable, has been obviated by a very ingenious contrivance. Some substance is employed which has a stronger affinity both for the cloth and the colouring matter. This substance is previously combined with the cloth, which is then dipped into the solution containing the dye-stuff. The dye-stuff combines with the intermediate substance, which, being firmly combined with the cloth, secures the permanence of the dye. Substances employed for this purpose are denominated mordants. The most important part of dyeing, is undoubtedly the proper choice, and the proper application of mordants, as upon them the permanency of almost every dye depends. Every thing which has been said respecting the application of colouring matters, applies equally to the application of mordants. They must be previously dissolved in some liquid, which has a weaker affinity for them, than the cloth has to which they are to be applied; and the cloth must be dipped, or even steeped in this solution, in order to saturate itself with the mordant. Almost the only substances used as mordants, are earths, metallic oxides, tan, and oil. — Of earthy mordants, the most important, and most generally used, is alumina. It is used either in the state of common alum, in which it is combined with sulphuric acid, or in that of acetite of alumina. Alum, when used as a mordant, is dissolved in water, and very frequently a quantity of tartar is dissolved along with it. Into this solution the cloth is put, and kept in it, till it has absorbed as much alumina as is necessary. It is then taken out, and for the most part washed and dried. It is now a good deal heavier than it was before, owing to the alumina which has combined with it. The tartar serves two purposes; the potass which it contains, combines with the sulphuric acid of the alum, and thus prevents that very corrosive substance from injuring the texture of the cloth, which otherwise might happen: the tartareous acid, on the other hand, combines with part of the alumina, and forms a tartrate of alumina, which is more easily decomposed by the cloth, than alum. Acetite of alumina has been introduced into dyeing. This mordant is prepared by pouring acetite of lead into a solution of alum; a double decomposition takes place, the sulphureous acid combines with the lead, and the compound precipitates in the form of an insoluble powder, while the alumina combines with the acetous acid, and remains dissolved in the liquid. This mordant is employed for cotton and linen, which have a weaker affinity than wool for alumina. It answers much better than alum; the cloth is more easily saturated

with alumina, and takes, in consequence, both a richer, and a more permanent, colour.

Besides alumina, lime is sometimes used as a mordant. Cloth has a strong affinity enough for it; but in general it does not answer so well, as it does not give so good a colour. When used, it is either in the state of lime-water, or of sulphate of lime dissolved in water. Almost all the metallic oxides have an affinity for cloth, but only two of them are extensively used as mordants, namely, the oxides of tin, and of iron. The oxide of tin was first introduced into dyeing by Kuster, a German chemist, who brought the secret to London in 1553. This period forms an era in the history of dyeing. The oxide of tin has enabled the moderns greatly to surpass the ancients in the fineness of their colours; by means of it alone, scarlet, the brightest of all colours, is produced.

Tin, as Proust has proved, is capable of two degrees of oxydation. The first oxide is composed of 0.70 parts of tin, and 0.30 of oxygen; the second or white oxide, of 0.60 parts of tin, and 0.40 of oxygen. The first oxide absorbs oxygen with very great facility, even from the air, and is rapidly converted into white oxide. This fact makes it certain, that it is the white oxide of tin alone which is the real mordant; even if the other oxide was applied to cloth, as it probably often is, it must soon be converted into white oxide, by absorbing oxygen from the atmosphere. Tin is used as a mordant in three states: dissolved into nitro-muriatic acid, in acetous acid, and in a mixture of sulphuric and muriatic acids. Nitro-muriate of tin is the common mordant employed by dyers. They prepare it by dissolving tin in diluted nitric acid, to which a certain proportion of muriate of soda (common salt), or of ammonia (sal ammoniac) is added. Part of the nitric acid decomposes these salts, combines with their base, and sets the muriatic acid at liberty. It was prepared at first with nitric acid alone, but that was very defective, because the nitric acid very commonly converts tin to white oxide, and then is incapable of dissolving it; the consequence of which is, the precipitation of the whole of the tin. To remedy this defect, common salt, or sal ammoniac, was very soon added: muriatic acid having the property of dissolving white oxide of tin very readily. A considerable saving of nitric, might be obtained by employing as much sulphuric acid, as is just sufficient to saturate the base of the common salt, or sal ammoniac employed. When the nitro-muriate of tin is to be used as a mordant, it is dissolved in a large quantity of water, and the cloth is dipped in the solution, and allowed to remain till sufficiently saturated. It is then taken out, and washed, and dried.

Tartar is usually dissolved in the water along with the nitro-muriate. The consequence of this is a double decomposition: the nitro-muriatic acid combines with the potash of the tartar, while the tartareous acid dissolves the oxide of the tin. When tartar is used, therefore, in any considerable quantity, the mordant is not a nitro-muriate, but a tartarite of tin. Iron, like tin, is capable of two degrees of oxydation; but the green oxide absorbs oxygen so readily from the atmosphere, that it is very soon converted into the red oxide: it is only this last oxide which is really used as a mordant in dyeing. The green oxide is indeed sometimes applied to cloth, but it very soon absorbs oxygen, and is converted into the red oxide. This oxide has a very strong affinity for all kinds of cloth. The permanency of iron spots on linen and cotton is a sufficient proof of this. As a mordant it is used in two states, in that of sulphate of iron (copperas), and acetite of iron. The first is commonly used for wool. The salt is dissolved in water, and the cloth dipped in it. It may be used also for cotton, but in most cases acetite of iron is preferred. It is prepared by dissolving iron or its oxide in vinegar, sour beer, &c. and the longer it is kept, the more it is preferred. The reason is, that this mordant succeeds best when the iron is in the state of red oxide. It would be better then to oxidate the iron, or convert it into rust before using it; which might be easily done by keeping it for some time in a moist place, and sprinkling it occasionally with water. Tan has a very strong affinity for cloth, and for several colouring matters; it is therefore very frequently employed as a mordant. An infusion of nut-galls, or of sumach, or any other substance containing tan, is made in water, and the cloth is dipped in this infusion, and allowed to remain till it has absorbed a sufficient quantity of tan. Silk is capable of absorbing a very great proportion of tan, and by that means acquires a great increase of weight. Manufacturers sometimes employ this method of increasing the weight of silk.

Tan is often employed also along with other mordants, in order to produce a compound mordant.

Oil is also used for the same purpose in the dyeing of cotton and linen. The mordants with which tan most frequently is combined, are alumina, and oxide of iron. Besides these mordants, there are several other substances frequently used as auxiliaries, either to facilitate the combination of the mordant with the cloth, or to alter the shade of colour; the chief of those are tartar, acetite of lead, common salt, sal ammoniac, sulphate, or acetite of copper, &c.

Mordants not only render the dye permanent, but have also considerable influence on the colour produced. The same colouring matter produces very different dyes ac-

cording as the mordant is changed. Suppose, for instance, that the colouring matter is cochineal; if we use the aluminous mordant, the cloth will acquire a crimson colour, but the oxide of iron produces with it a black.

In dyeing, then, it is not only necessary to procure a mordant which has a sufficiently strong affinity for the colouring matter and the-cloth, and a colouring matter which possesses the wished-for colour in perfection, but we must procure a mordant, and colouring, of such natures, that, when combined together, they shall possess the wished-for colour in perfection. It is evident, too, that a great variety of colours may be produced with a single dye-stuff, provided we can change the mordant sufficiently.

The colouring matter, with which the cloth is dyed, does not cover every portion of its surface; its particles attach themselves to the cloth at certain distances from each other; for cloth may be dyed different shades of the same colour, lighter or darker, merely by varying the quantity of colouring matter. With a small quantity, the shade is light, and it becomes deeper as the quantity increases. Now, this would be impossible if the dye-stuff covered the whole of the cloth. That the particles of colouring matter, even when the shade is deep, are at some distance, is evident, from this well-known fact, that cloth may be dyed two colours at the same time. Thus cloth gets green colour by being first dyed blue, and then yellow.

The colours denominated by dyers *simple*, because they are the foundation of all their other processes, are four, namely, first, blue; second, yellow; third, red; fourth, black. To these they usually add a fifth, under the name of soot or brown colour.

Of dyeing Blue.—The only colouring matters employed in dyeing blue, are woad and indigo.

Woad is an indigenous plant in this country, but, since its qualities have been duly appreciated, has been *cultivated* with much care and expense. Indigo is a blue powder extracted from a species of plant which is cultivated, for that purpose, in the East and West Indies. These plants contain a peculiar green pollen, which in that state is soluble in water. This pollen has a strong affinity for oxygen, which it attracts greedily from the atmosphere; in consequence of which it assumes a blue colour, and becomes insoluble in water. Indigo has a very strong affinity for wool, silk, cotton, and linen. Every kind of cloth, therefore, may be dyed with it, without the assistance of any mordant whatever.

The colour thus induced is very permanent, because the indigo is already saturated with oxygen, and because it is not liable to be decomposed by those substances, to

the action of which the cloth is exposed. But it can only be applied to cloth in a state of solution, and the only solvent known being sulphuric acid, it would seem at first sight that the sulphuric acid solution is the only state in which indigo can be employed as a dye.

The sulphate of indigo is indeed often used to dye wool and silk, blue; but it can scarcely be applied to cotton and linen, because the affinity of these substances for indigo is not great enough to enable them readily to decompose the sulphate.

The colour given by sulphate of indigo is exceedingly beautiful; it is known by the name of Saxon blue. One part of indigo is to be dissolved in four parts of concentrated sulphuric acid; to the solution, one part of dry carbonate of potash is to be added, and then it is to be diluted with eight times its weight of water. The cloth must be boiled for an hour in a solution containing five parts of alum, and three of tartar, for every thirty-two parts of cloth. It is then to be thrown into a water-bath, containing a greater or smaller proportion of the diluted sulphate of indigo, according to the shade which the cloth is intended to receive.

In this bath it must be boiled till it has acquired the wished-for colour. The alum and tartar are not intended to act as mordants, but to facilitate the decomposition of the sulphate of indigo. The alkali added to the sulphate answers the same purpose. These substances, also, by saturating part of the sulphuric acid, serve in some measure to prevent the texture of the cloth from being injured by the action of the acid, which is very apt to happen in this process. But sulphate of indigo is by no means the only solution of that pigment employed in dyeing. By far the most common method is, to deprive indigo of the oxygen to which it owes its blue colour, and thus reduce it to the state of green pollen; and then to dissolve it in water, by means of alkalies, or alkaline earths, which in that state act upon it very readily.

Two different methods are employed for this purpose. The first of these methods is to mix with indigo a solution of some substance which has a stronger affinity for oxygen than the green basis of indigo; green oxide, for instance, and different metallic sulphurets. If therefore indigo, lime, and green sulphate of iron, are mixed together in water, the indigo gradually loses its blue colour, becomes green, and is dissolved; while the green oxide of iron is converted into the red oxide.

The manner in which these changes take place is obvious: part of the lime decomposes the sulphate of iron; the green oxide, the instant that it is set at liberty, attracts oxygen from the indigo, decomposes it, and reduces it to the state of green pollen. This

green pollen is immediately dissolved by the action of the rest of the lime.

The second method is, to mix the indigo in water with certain vegetable substances, which readily undergo fermentation. During this fermentation, the indigo is deprived of its oxygen, and is dissolved by means of quick-lime or alkali, which is added to the solution. The first of these methods is usually followed in dyeing cotton and linen; the second in dyeing wool and silk. In the dyeing of wool, woad and bran are commonly employed as vegetable ferments, and lime as the solvent of the green base of the indigo.

Woad itself contains a colouring matter precisely similar to indigo; and by following the common process, indigo may be extracted from it. In the usual state of woad, when purchased by the dyer, the indigo, which it contains, is probably not far from the state of the green pollen.

Its quantity in woad is but small, and it is mixed with a great proportion of other vegetable matter. When the cloth is first taken out of the vat, it is of a green colour, but it soon becomes blue, by attracting oxygen from the air. It ought to be carefully washed, to carry off the uncombined particles.

This solution of indigo is liable to two inconveniences: first, it is apt sometimes to run too fast into the putrid fermentation; this may be known by the putrid vapours which it exhales, and by the disappearing of the green colour. In this state it would soon destroy the indigo altogether. The inconvenience is remedied by adding more lime, which has the property of moderating the putrescent tendency.

Secondly, sometimes the fermentation goes on too languidly. This defect is remedied by adding more bran or woad, in order to diminish the proportion of quick-lime.

Silk is dyed light blue, by a ferment of six parts of bran, six of indigo, six of potash, and one of madder. To dye it of a dark blue, it must previously receive what is called a ground colour; a red dye-stuff, called archil, is used for this purpose. Cotton and linen are dyed blue by a solution of one part of indigo, one part of green sulphate of iron, and two parts of quick-lime.

Of dyeing Yellow.—The principal colouring materials for dyeing yellow are, weld, fustic, and quercitron-bark. Weld is a plant which grows commonly in this country. Fustic is the wood of a large tree, which grows in the West Indies. Quercitron is a tree growing in North America, the bark of which contains colouring matter. Yellow colouring matters have too weak an affinity for cloth to produce permanent colours without the use of mordants. Cloth, therefore, before it is dyed yellow, is always prepared by combining some mordant or other with it. The mordant most common-

ly employed for this purpose is alumina. Oxide of tin is sometimes used when very fine yellows are wanting. Tan is often employed as a subsidiary to alumina, and in order to fix it more copiously on cotton and linen.

Tartar is also used as an auxiliary to brighten the colour; and muriate of soda, sulphate of lime, and even sulphate of iron, in order to render the shade deeper. The yellow dyed by means of fustic is more permanent, but not so beautiful as that given by weld, or quercitron. As it is permanent and not much injured by acids, it is often used in dyeing compound colours, where a yellow is required. The mordant is alumina. When the mordant is oxide of iron, fustic dyes a good permanent drab colour.

Weld, and quercitron-bark, yield nearly the same kind of colour; but as the bark yields colouring matter in much greater abundance, it is much more convenient, and upon the whole cheaper than weld. It is probable, therefore, that it will gradually supersede the use of that plant. The method of using each of these is nearly the same.

Wool may be dyed yellow by the following process. Let it be boiled for an hour or more with about 1-6th of its weight of alum dissolved in a sufficient quantity of water. It is then to be plunged without being rinsed into a bath of warm water, containing in it as much quercitron-bark as equals the weight of the alum employed as a mordant. The cloth is to be turned through the boiling liquid till it has acquired the intended colour. Then a quantity of clean powdered chalk, equal to the hundredth part of the weight of the cloth, is to be stirred in, the operation of dyeing being continued for eight or ten minutes longer. By this method a pretty deep and lively yellow may be given, fully as permanent as weld yellow. For very bright orange or golden yellow, it is necessary to have recourse to the oxide of tin as a mordant.

For producing bright golden yellows, some alum must be added along with the tin.

In order to give the yellow that delicate green shade so much admired for certain purposes, tartar must be added in different proportions, according to the shade. By adding a small proportion of cochineal the colour may be raised to a fine orange, or even an aurora.

Silk may be dyed different shades of yellow, either by weld, or quercitron-bark, but the last is the cheapest of the two. The proportion should be from one to two parts of bark to twelve parts of silk, according to the shade. The bark tied up in a bag should be put into the dyeing vessel while the water which it contains is cold; and when it has acquired the heat of about 100°, the silk, having been previously alumed, should be dipped in, and continued, till it assumes the desired colour.

When the shade is required to be deep, a little chalk, or pearl-ash, should be added towards the end of the operation.

The best method of dyeing cotton and linen yellow, is as follows:

The mordant should be acetite of alumina, prepared by dissolving one part of acetite of lead, and three parts of alum, in a sufficient quantity of water. This solution should be heated to the temperature of 100°, the cloth should be soaked in it for two hours, then wrung out, and dried. The soaking may be repeated and the cloth again dried as before. It is then to be barely wetted with lime-water, and afterwards dried. The soaking in the acetite of alumina may again be repeated; and if the shade of yellow is required to be very bright and durable, the alternate wetting with lime-water, and soaking in the mordant, may be repeated three or four times. By this contrivance a sufficient quantity of alumina is combined with the cloth, and the combination is rendered more permanent by the addition of some lime. The dyeing bath is prepared by putting 12 or 18 parts of quercitron-bark (according to the depth of the shade required), tied up in a bag, into a sufficient quantity of cold water. Into this bath the cloth is to be put, and turned round in it for an hour, while its temperature is gradually raised to about 120°. It is then to be brought to a boiling heat, and the cloth allowed to remain in it after that only a few minutes. If it is kept long at a boiling heat, the yellow acquires a shade of brown.

Of dyeing Red.—The colouring matters employed for dyeing red, are kermes, cochineal, archil, madder, carthamus, and Brazil-wood.

Kermes is a species of insect, affording a red colour by solution in water; but it is not so beautiful as cochineal. The decoction of cochineal is a very beautiful crimson colour. Alum brightens the colour of the decoction, and occasions a crimson precipitate. Muriate of tin gives a copious fine red precipitate. Archil is a paste formed of a species of lichen pounded and kept moist for some time with stale urine. Madder is the root of a well-known plant. Carthamus is the flower of a plant (*Carthamus tinctorius*) cultivated in Spain and the Levant. It contains two colouring matters: a yellow which is soluble in water, and a red which is insoluble in water, but soluble in alkaline carbonates. The red colouring matter of carthamus, extracted by carbonate of soda, and precipitated by lemon juice, constitutes the rouge employed by ladies as a paint. It is afterwards ground with a certain quantity of talc. The fineness of the talc, and the proportion of it mixed with the carthamus, occasion the difference between the cheaper, and dearer, kinds of rouge.

Brazil-wood is the wood of a tree growing on the Continent of America, and in the West Indies; its decoction is a fine red colour. None of the red colouring matters has so strong an affinity for cloth as to produce a permanent red, without the assistance of mordants. The mordants employed are alumina, and oxide of tin; oil, and tan in certain processes, are also used; and tartar, and muriate of soda, are frequently called in as auxiliaries. Coarse woollen stuffs are dyed red with madder, or archil; but fine cloth is almost exclusively dyed with cochineal, though the colour which it receives from kermes is much more durable. Brazil-wood is scarcely used, except as an auxiliary, because the colour which it imparts to wool is not permanent. Wool is dyed crimson by first impregnating it with alumina, by means of an alum bath, and then boiling it in a decoction of cochineal, till it has acquired the wished-for colour. The crimson will be finer if the tin mordant be substituted for alum; indeed it is usual with dyers to add a little nitro-muriate of tin, when they want fine crimsons. The addition of archil, and potass, to the cochineal, both renders the crimson darker, and gives it more bloom; but the bloom very soon vanishes. For paler crimsons, one half of the cochineal is withdrawn, and madder substituted in its place.

Wool may be dyed scarlet, the most splendid of all colours, by first boiling it in a solution of murio-sulphate of tin, then dyeing it pale yellow with quercitron-bark, and afterwards crimson with cochineal; for scarlet is a compound colour, consisting of crimson mixed with a little yellow.

Silk is usually dyed red with cochineal, or carthamus, and sometimes Brazil-wood. Kermes does not answer for silk; madder is scarcely ever used for that purpose, because it does not yield a colour bright enough. Archil is employed to give silk a bloom; but it is scarcely used by itself, unless when the colour wanted is lilac. Silk may be dyed crimson by steeping it in a solution of alum, and then dyeing it in the usual way in a cochineal bath. The colours known by the names of poppy, cherry, rose, and flesh-colour, are given to silks by means of carthamus. The process consists merely in keeping the silk, as long as it extracts any colour, in an alkaline solution of carthamus, into which as much lemon-juice, as gives it a fine cherry colour, has been poured.

Silk cannot be dyed a full scarlet; but a colour approaching to scarlet may be given it, by first impregnating the stuff with murio-sulphate of tin, and afterwards dyeing it in a bath, composed of four parts of cochineal, and four parts of quercitron-bark. To give the colour more body, both the mordant and the dye may be repeated. A

colour approaching scarlet may be also given to silk, by first dyeing it in crimson, then dyeing it with carthamus, and lastly yellow without heat. Cotton and linen are dyed red with madder. The process was borrowed from the East; hence the colour is often called Adrianople or Turkey red. The cloth is first impregnated with oil, then with galls, and lastly with alum. It is then boiled for an hour in a decoction of madder, which is commonly mixed with a quantity of blood. After the cloth is dyed, it is plunged into a soda ley, in order to brighten the colour. The red given by this process is very permanent, and when properly conducted, it is exceedingly beautiful. The whole difficulty consists in the application of the mordant, which is by far the most complicated in the whole art of dyeing.

Cotton may be dyed scarlet, by means of murio-sulphate of tin, cochineal, and quercitron-bark, used as for silk, but the colour is too fading to be of any value.

Of dyeing Black.—The substances employed to give a black colour to cloth, are red oxide of iron, and tan. These two substances have a strong affinity for each other, and when combined, assume a deep black colour, not liable to be destroyed by the action of air or light.

Logwood is usually employed as an auxiliary, because it communicates lustre, and adds considerably to the fullness of the black. It is the wood of a tree, which is a native of several of the West India islands, and of that part of Mexico which surrounds the Bay of Honduras. It yields its colouring matter to water. The decoction is at first a fine red, bordering on violet, but if left to itself, it gradually assumes a black colour. Acids give it a deep red colour; alkalies a deep violet, inclining to brown; sulphate of iron renders it as black as ink, and occasions a precipitate of the same colour.

Cloth, before it receives a black colour, is usually dyed blue; this renders the colour much fuller, and finer, than it would otherwise be. If the cloth be coarse, the blue dye may be too expensive; in that case a brown colour is given by means of walnut-peels.

Wool is dyed black by the following process. It is boiled for two hours in a decoction of nut-galls; afterwards immersed for two hours more in a bath composed of logwood, and sulphate of iron, kept during the whole time at a scalding heat, but not boiled. During the whole operation, it must be frequently exposed to the air; because the green oxide of iron, of which the sulphate is composed, must be converted into red oxide by absorbing oxygen, before the cloth can acquire a proper colour. The common proportions are five parts of galls, five of sulphate of iron, and thirty of log-

wood, for every hundred of cloth. A little acetite of copper is commonly added to the sulphate of iron, because it is thought to improve the colour.

Silk is dyed nearly in the same manner. It is capable of combining with a great deal of tan; the quantity given is varied at the pleasure of the artist, by allowing the silk to remain a longer, or shorter, time in the decoction. It is by no means so easy to give a full black to linen or cotton. The cloth, previously dyed blue, is steeped for 24 hours in a decoction of nut-galls. A bath is prepared containing an acetite of iron, formed by saturating acetic acid with brown oxyd of iron; into this bath the cloth is put in small quantities at a time, wrought with the hand for a quarter of an hour, then wrung out, and aired again; wrought in a fresh quantity of the bath, and afterwards aired. These alternate processes are repeated, till the colour wanted is given: a decoction of alder-bark is usually mixed with the liquor containing the nut-galls.

Of dyeing Brown.—Brown, or fawn colour, though in fact a compound, is usually ranked among the simple colours, because it is applied to cloth by a single process. Various substances are used for brown dyes.

Walnut-peels, or the green covering of the walnuts, when first separated, are white internally, but soon assume a brown, or even a black, colour, on exposure to the air. They readily yield their colouring matter to water. They are usually kept in large casks, covered with water for above a year before they are used. To dye wool brown with them, nothing more is necessary than to steep the cloth in a decoction of them, till it has acquired the wished-for colour. The depth of the shade is proportional to the strength of the decoction. The root of the walnut-tree contains the same colouring matter, but in a smaller quantity. The bark of the birch also, and many other trees, may be used for the same purpose. It is very probable that the brown colouring matter is in these vegetable substances combined with tan. This is certainly the case in sumach, which is often employed to produce a brown. This combination explains the reason why no mordant is necessary: the tan has a strong affinity for cloth, and the colouring matter for the tan. The dye-stuff, and the mordant, are already, in fact, combined together.

Of dyeing compound colours.—Compound colours are produced by mixing together two simple ones; or, which is the same thing, by dyeing cloth first one simple colour, and then another. These colours vary to infinity, according to the proportion of the ingredients employed. They may be arranged under the following classes. Mixtures of, 1. blue and yellow; 2. blue and red; 3. yellow and red; 4. black and other colours.

Mixture of blue and yellow.—This forms green, which is distinguished by dyers into a variety of shades, according to the prevalence of either of the component colours. Thus we have sea-green, grass-green, pea-green, &c. Wool, silk, and linen, are usually dyed green by giving them first a blue colour, and afterwards dyeing them yellow; because when the yellow is first given, several inconveniences follow: the yellow partly separates again in the blue vat, and communicates a green colour to it, and thus renders it useless for every other purpose except dyeing green. Any of the usual processes for dyeing blue and yellow may be followed, taking care to proportion the depth of the shades to that of the green required. When sulphate of indigo is employed, it is usual to mix all the ingredients together, and to dye the cloth at once; this produces what is known by the name of Saxon or English green.

Mixtures of blue and red.—These form different shades of violet, purple, and lilac. Wool is generally first dyed blue, and afterwards scarlet, in the usual manner. By means of cochineal mixed with sulphate of indigo, the process may be performed at once. Silk is first dyed crimson, by means of cochineal, and then dipped into the indigo vat. Cotton and linen are first dyed blue, then galled, and soaked in a decoction of logwood; but a more permanent colour is given by means of oxide of iron.

Mixtures of yellow and red.—These produce orange. When blue is combined with red and yellow on cloth, the resulting colour is olive. Wool may be dyed orange, by first dyeing it scarlet and then yellow. When it is dyed first with madder, the result is cinnamon-colour. Silk is dyed orange by means of carthamus; a cinnamon colour by logwood, Brazil-wood, and fustic mixed together. Cotton and linen receive a cinnamon colour by means of weld and madder: and an olive colour by being passed through a blue, yellow, and then a madder-bath.

Mixtures of black with other colours.—These constitute greys, drabs, and browns. If cloth is previously combined with brown oxide of iron, and afterwards dyed yellow with quercitron-bark, the result will be a drab of different shades, according to the proportion of the mordant employed. When the proportion is small, the colour inclines to olive, or yellow; on the contrary, the drab may be deepened, or saddened, as the dyers term it, by mixing a little sumach with the bark.

DYERS. By stat. 3 & 4 Edw. VI. c. 2. no dyer may dye any cloth with orchal, or with Brazil-wood, to make a false colour in cloth wool, &c. on penalty of 20s.

By stat. Eliz. c. 9. dyers are to fix a

seal of lead to cloths, with the letter M, to show that they are well maddered, &c. or forfeit 3s. 4d. per yard.

By stat. 23 Geo. 3. c. 15. several penalties are inflicted on dyers who dye any cloth deceitfully, and not woaded throughout with indigo, and madder. Dyeing blue with logwood, to forfeit 20*l*. Dyers in London are subject to the inspection of the Dyers' Company, who appoint searchers. In other places, these are appointed by the justices, and opposing the searchers incurs a penalty of 10*l*.

DYER'S GREEN WEED, or **WOOD-WAXEN**, is an indigenous plant growing in pastures, the flowers of which afford a

yellow colour, which is much esteemed for dyeing wool green. This plant also yields the fine yellow lacker of painters, by boiling the stalks and leaves in lime-water, and again placing the clarified decoction over the fire with chalk of alum.

DYER'S WEED, or **YELLOW WEED**. This also gives a most beautiful yellow colour to wool, cotton, mohair, silk, and linen, and is principally used for this purpose, as it affords an uncommonly bright dye. A decoction of this plant also communicates a green colour to blue cloths, and forms the basis of what is termed *Dutch Pink*. The tinging properties are in the stems and roots.

E A R

E, the second vowel, and fifth letter of the alphabet, as a numeral stands for 250. In the calendar, it is the fifth of the dominical letters. And in sea charts, it distinguishes all the easterly points: thus E. alone denotes east, E. by S. and E. by N. east by south, and east by north.

EAGLE WOOD, (GER. *Alderholz*. DU. *Agelhout*. DA. *Ornetræ*. SW. *Ornträ*. FR. *Bois d'Aigle*. IT. *Legno d'Aquila*. SP. *Madera del Aguila*. PORT. *Páo de Aguia*. LAT. *Lignum Aquile*.) a species of beautiful wood, employed chiefly by turners in the formation of the finer articles: it comes to us from many parts of Asia.

EARING, in the sea language, is that part of the bolt-rope, which, at the four corners of the sail, is left open, in the shape of a ring. The two uppermost parts are put over the ends of the yard-arms, and so the sail is made fast to the yard; and into the lowermost earings, the sheets and tacks are seized or bent at the clew.

EARNEST, is the money advanced to bind the parties to the performance of a verbal agreement. The person who gives it, is in strictness obliged to abide by his bargain; and, if he declines, is not discharged on forfeiting his earnest, but may be sued for the money stipulated, and damages; and by statute of frauds, 29 C. 2. cap. 3. no contract for sale of goods to the value of 10*l*. or more, is valid, unless such earnest is given, or unless the contract be in writing.

EAR-RING, (*Ear-rings*. GER. *Ohr-ringe*. DU. *Oor-ringen*. DA. *Oxeringe*. SW. *Orringar*. FR. *Boucles d'oreille*, *Pendants*. IT. *Orrechini*, *Pendenti*. SP. *Arracadas*. PORT. *Arrecadas*, RUS. *Ssergü*. POL. *Kolczyki*.) an ornament worn by women, usually composed of gold, and frequently adorned with precious stones, pearls, &c. Those

E B O

of superior value are chiefly manufactured in London; those of an inferior description, almost exclusively at Birmingham.

EARTHEN-WARE. (GER. *Irdene Waaren*. DU. *Aardegoed*. DA. *Leerkar*. SW. *Lerkärl*. FR. *Vaisselle de terre*, *Poterie*. IT. *Stoviglie*, *Terraglia*. SP. *Loza de barro*. PORT. *Louca de barro*. RUS. *Gorschetschnüe possudü*. POL. *Gliniane naczynia*.) This is a general term made use of to express all kinds of articles made of earth for culinary and such like purposes; the principal English potteries are in Staffordshire. See **POTTERIES**.

EASING, in the sea language, signifies the slackening of a rope, or the like: thus, "to ease the bow-line or sheet," is to let them go slacker; "to ease the helm," is to let the ship go more large, more before the wind, or more larboard.

EAST INDIA COMPANY. See **COMPANY**.

EBONY-WOOD, (GER. *Ebenholz*. DU. *Ebbenhout*. DA. *Ebentræ*. SW. *Ebenträd*. FR. *Ébène*. IT. and SP. *Ebano*. PORT. *Ebano*, *Evano*. RUS. *Ebenowoderewo*. POL. *Heban*. LAT. *Eberus*.) is brought from the Indies, exceedingly hard, and heavy, susceptible of a very fine polish, and on that account used in mosaic and inlaid works, toys, &c. There are many kinds of ebony: the most usual among us are black, red, and green, all of them the product of the island of Madagascar, where the natives call them indifferently *hazon mainthi*, black wood. The island of St. Maurice, belonging to the Dutch, likewise furnishes part of the ebonies used in Europe. Authors and travellers give very different accounts of the tree that yields the black ebony. By some of their descriptions, it should be a sort of palm-tree; by others, a cytisus, &c. Black

ebony is much preferred to that of other colours. The best is a jet black, free of veins and rind, very massive, astringent, and of an acrid pungent taste. Its rind, infused in water, is said to be antiscorbutic. It yields an agreeable perfume when laid on burning coals: when green, it readily takes fire, from the abundance of its fat. If rubbed against a stone, it becomes brown. The Indians make statues of their gods, and sceptres for their princes, of this wood. It is now much less used amongst us than formerly; since the discovery of so many ways of giving other hard woods a black colour. As to the green ebony, besides Madagascar, and St. Maurice, it likewise grows in the Antilles, and especially in the island of Tobago. Under its bark is a white substance about two inches thick; all beneath which, to the very heart, is a deep green, approaching towards a black, though sometimes streaked with yellow veins. Its use is not confined to mosaic work: it is likewise useful in dyeing, as yielding a fine green tincture. As to red ebony, called also *grenadilla*, we know little of it more than the name. The cabinet-makers, inlayers, &c. make pear-tree and other woods pass for ebony, by giving them the same black colour. This some do by a strong decoction of galls, to which is added a small quantity of vitriolated iron.

EDDY-TIDE, or **EDDY-WATER**, among seamen, is where the water runs back contrary to the tide; or that which hinders the free passage of the stream, and so causes it to return again.

ELDER, or **DWARF ELDER**, an indigenous plant growing wild in hedges. Its berries communicate a violet colour, and their juice mixed with vinegar, dyes raw linen, as well as morocco leather, of an azure blue. Another species, or the common elder, as its wood is remarkably hard and tough, is made into meat-skewers, tops for fishing-rods, and needles for weaving nets; it is also used for turning.

ELDER WINE. To make this wine, the following are the directions. To one quart of berries put two quarts of water, boil half an hour, run the liquor, and break the fruit through a hair sieve; then, to every quart of juice put three-quarters of a pound of Lisbon sugar. Boil the whole a quarter of an hour, with ginger, and cloves. Pour it into a tub, and when of a proper warmth, into the barrel, with toast and yeast to work. When it ceases to hiss, put one quart of brandy to eight gallons, and stop up. Bottle in the spring, or at Christmas. The liquor must be in a warm place to make it work.

ELEMI. See **GUM, GUM-RESIN**.

ELEPHANTS' TEETH, (*Ger. Elephantenzähne. Du. Olyfantianden. Da. Elefanttänder. Sw. Elefantständer. Fr. Dents d'éléphant. It. Denti di liofante.*

Sr. Dientes de elefante. Port. Dentes de elephante.) See **IVORY**.

ELK. The hair of this animal, which is very common in North America, is used for stuffing saddles; its hoofs are employed in pharmacy, and its hide is turned to various uses.

ELL, a measure of length, different in different countries; but the English ell used in this country, is equal to five quarters, or to a yard and a quarter. In Scotland, the ell contains $37\frac{2}{10}$ English inches. See **WEIGHTS and MEASURES**.

EMBARGO, an arrest on ships or merchandise, by public authority; or a prohibition of the state, commonly on foreign ships, in time of war, to prevent their going out of port, sometimes to prevent their coming in, and sometimes both, for a limited time. The king may lay embargoes on ships, or employ those of his subjects, in time of danger, for service and defence of the nation; but they must not be for the private advantage of a particular trader, or company, and therefore a warrant to stay a single ship is no legal embargo. No inference can be made from embargoes which are only in war-time, and are a prohibition by advice of council, and not a prosecution of parties. If goods are laden on board, and after embargo or restraint from the prince or state, comes forth, and then the master of the ship breaks ground or endeavours to sail, if any damage accrues, he must be responsible for the same; the reason is, because his freight is due, and must be paid, even though the goods be seized as contraband. Embargo differs from *quarantine*, as this last is usually for the term of forty days, in which persons from foreign ports are not permitted to come on shore, to prevent the introduction of the plague into these countries. See **QUARANTINE SHIPPING**.

EMBASSADOR. See **AMBASSADOR**.

EMBEZZLEMENT means, technically, larceny by servants of their masters' goods. The first statute on this subject was 21 Hen. 8. c. 7. The provisions of this early statute were extended, and made more precise, by 39 Geo. 3. c. 85. which recites, that it is for protecting masters against embezzlements by their clerks and servants, or persons employed for the purpose, or in the capacity of servants or clerks, who shall, by virtue of such employment, receive or take into their possession any money, goods, bond, bill, note, banker's draft, or other valuable security or effects, for, or in the name, or on account of, their master or employer; and who shall fraudulently embezzle, secrete, or make away with the same, or any part thereof; and enacts that every such offender shall be deemed to have feloniously stolen the same from his master or employer, for whose use, or on whose

account, the same was delivered to, or taken into the possession of such servant, clerk, or other person so employed, although such money, goods, bond, bill, note, banker's draft, or other valuable security, was or were no otherwise received into the possession of his or their servants, clerk, or other person so employed; and every such offender, his adviser, procurer, aider, or abettor, being thereof lawfully convicted or attainted, shall be liable to be transported to such part beyond the seas as his Majesty, by and with the advice of his Privy Council, shall appoint, for any term not exceeding 14 years, in the discretion of the court before whom such offender shall be convicted or adjudged.

This statute, however, extended only to the embezzlement of the matters described in it; and doubts also frequently were suggested respecting its application to cases where property was deposited in the hands of agents of different descriptions, from those to whom the statute was supposed especially to refer; wherefore at length the 52 Geo. 3. c. 63. was passed in terms so comprehensive, as to be supposed to comprise every possible case of personal effects, or securities, of all description, being deposited in the hands of agents of all denominations, for any purpose whatever. See 2 *Dick. Pract. Expos.* 17.

EMBROIDERY, (GER. *Stickerey*. DU. *Borduurwerk*. DA. *Brodering*. SW. *Borderwerk*. FR. *Broderie*. IT. *Ricamo*. SP. *Bordado*. PORT. *Bordadura*. RUS. *Шитье*. POL. *Wyszywianie*.) a work of gold or silver, or silk thread, wrought by the needle upon cloth, stuffs, or muslin, into various figures. In embroidering stuffs, the work is performed in a kind of a loom, because the more the piece is stretched, the easier it is worked. As to muslin, they spread it upon a pattern ready designed; and sometimes, before it is stretched upon the pattern, it is starched, to make it more easy to handle. Embroidery on the loom is less tedious than the other, in which, while the flowers are worked, all the threads of the muslin, both lengthwise, and breadthwise, must be continually counted; but on the other hand this last is much richer in points, and susceptible of greater variety. Cloths too much milled are scarcely susceptible of this ornament, and in effect we seldom see them embroidered. The thinnest muslins are the best for this purpose, and they are embroidered to the greatest perfection in Saxony.

In other parts of Europe, however, they embroider very prettily, and especially in France. There are several kinds of embroidery, viz. 1. Embroidery on the stamp, where the figures are raised and rounded, having cotton or parchment put under them to support them. 2. Low embroidery, where the gold and silver lie low

upon the sketch, and are stitched with silk of the same colour. 3. Guimped embroidery: this is performed either in gold or silver; first a sketch is made upon the cloth, then put on cut vellum, and afterwards sewed on the gold and silver with silk thread. On this kind of embroidery are often put gold and silver cord, tinsel, and spangles. 4. Embroidery on both sides; that which appears on both sides of the stuff. 5. Plain embroidery; where the figures are flat and even, without cords, spangles, or other ornaments. No foreign embroidery, or gold or silver brocade, is permitted to be imported into this kingdom, on pain of being seized and burnt, and a penalty of 100*l.* for each piece. By stat. 22 Geo. 2. c. 36. no person is allowed to sell any foreign embroidery, gold or silver thread-lace, fringe, or brocade, or make up the same into any garment, upon pain of having it burnt, and incurring a penalty of 100*l.*

EMERALD, (GER. DU. DA. and SW. *Smaragd*. FR. *Emeraude*. IT. *Smeraldo*. SP. and PORT. *Esmeralda*. RUS. *Изумруд*. POL. *Szmaragd*. LAT. *Smaragdus*.) is one of the most beautiful of all the class of coloured gems, when perfect; its colour a pure green. Our jewellers distinguish emeralds into two kinds, the oriental, and occidental: the emeralds of the East Indies are evidently finer than those of any other part of the world; but our jewellers, seldom meeting with these, call the American emeralds the oriental, and usually sell crystals accidentally tinged with green, under the name of occidental emeralds: these being also the most common, there has grown an opinion among the lapidaries, that the emerald is no harder than the crystal; because what they take to be emeralds, are in general only crystals. The genuine emerald is found of various sizes, but usually small; great numbers of them are met with of about the 16th part of an inch in diameter, and they are found from this size to that of a walnut. Emeralds are found in the East Indies, and in many parts of America, particularly about the gold mines of Peru; they are also met with in Silesia, Bohemia, and in other parts of Europe. The emerald is next in hardness to the ruby, and varies in colour from the pale to the perfect green. When heated to 120° Wedgewood, it becomes blue, but recovers its colour when cold.

EMERY, (GER. and SW. *Smirgel*. DU. *Ameril*, *Smergel*. DA. *Smergel*. FR. *Emeril*, *Emeri*. IT. *Smeriglio*, *Smeregio*. SP. and PORT. *Esmeril*. RUS. *Nashdak*. POL. *Szmergiel*. LAT. *Smiris*.) in natural history, a rich iron-ore found in large masses, of no determinate shape, or size, extremely hard, and very heavy. It is usually of a dusky brownish-red on the surface, but when broken is of a fine, bright, iron-grey, but

not without some tinge of redness, and is spangled all over with shining specks, which are small flakes of foliaceous talc, highly impregnated with iron. It is also sometimes very red, and then usually contains veins of gold. It is imported from the island of Naxos, where it exists in great abundance, and is also found in Sweden, Germany, Italy, England, and many other places. The island of Guernsey furnishes a great deal of it. It is opaque and brittle; its specific gravity is about four.

Emery is prepared for the manufacturers by grinding in mills, and the powder is separated into parcels of different degrees of fineness by washing; these are called the first, second, and third sort; the first being that which remains longest suspended in water, the others, such as sink sooner from the same liquor, and from which it is poured, while yet turbid, to settle for the finer kind. These several sorts are of great use to various artificers in polishing and burnishing iron and steel works, marble, cutting, and scalloping glass, &c. The lapidaries cut the ordinary gems in their wheels, by sprinkling the wetted powder of emery over them, the wheels they use being usually of lead, with a small admixture of pewter, that their softness may admit the emery the better. It will not cut diamonds.

EMMERITES, a species of Indian calico.

ENAMEL, (GER. *Schmelz*, *Email*. DE. *Emaus*. DA. *Smelt*. SW. *Smalta*, *Smaltglas*. FR. *Email*. IT. *Smalto*. SP. and PORT. *Esmalte*. RUS. *Finist*, *Steklariss*. POL. *Smelc*.) a kind of coloured glass, used in enamelling and painting in enamel. Enamels have for their basis a pure crystal-glass or frit, ground up with a fine calx of lead and tin prepared for the purpose, with the addition, usually, of white salt of tartar. These ingredients baked together are the matter of all enamels, which are made by adding colours of different kinds, in powder, to this matter, and melting or incorporating them together in a furnace.

For white enamel, Meri De Arte Vitriar directs only manganese to be added to the matter, which constitutes the basis; for azure, zaffer mixed with calx of brass; for green, calx of brass with scales of iron, or with crocus martis; for black, zaffer with manganese, or with crocus martis; or manganese with tartar; for red, manganese or calx of copper and red tartar; for purple, manganese with calx of brass; for yellow, tartar and manganese; and for violet-coloured enamel, manganese with thrice-calcined brass. In making these enamels, the following general cautions are necessary to be observed. 1. That the pots be glazed with white glass, and be such as will bear the fire. 2. That the matter of enamels

be very nicely mixed with the colours. 3. When the enamel is good, and the colour well incorporated, it must be taken from the fire with a pair of tongs. 4. The general way of making the coloured enamels is this; powder, sift, and grind all the colours very nicely, and first mix them with one another, and then with the common matter of enamels; then set them in pots in a furnace, and when they are well mixed and incorporated, cast them into water, and when dry, set them in a furnace again to melt, and when melted take a proof of it. If too deep-coloured, add more of the common matter of enamels; and if too pale, add more of the colours.

Enamels are used either in counterfeiting or imitating precious stones, in painting in enamel, or by enamellers, jewellers, and goldsmiths, in gold, silver and other metals. The first two kinds are usually prepared by the workmen themselves, who are employed in these arts. That used by jewellers, &c. is brought to us chiefly from Venice or Holland, in little cakes of different sizes, of about four inches in diameter, having the mark of the maker struck upon them with a puncheon.

ENAMELLER. The enameller differs from other painters, inasmuch as he uses metallic colours, which, to acquire their proper hues, must be submitted to the action of fire; and this requires considerable art, and great vigilance.

Copper, and gold, are the most usual metals which are used as a substratum; but copper is the best, because it will bear the greatest heat before it is brought into fusion.

The enamel-painter has more occasion for chemical knowledge than the painter in oil, because he must carry his ideas of colours in his head; thus, he lays on black when he wishes to produce red; and colours which are unburned have not the least resemblance to those produced by the heat of fire; consequently, he has no opportunity of judging by the eye, as painters in oil, or water-colours, have.

The art of painting in enamel is performed by laying white enamel on plates of metal, and then painting it with colours, melted in the fire, where they receive a lustre like that of glass. This painting is the most prized of all, for its peculiar brightness and vivacity, which is very permanent; the force of its colours not being effaced or sullied by time, as in other painting, and continuing always as fresh as when it came out of the workman's hands. It is usual in miniature, it being the more difficult the larger it is, by reason of certain accidents it is liable to in the operation. Fine enamelling should only be practised on plates of gold, the other metals being less pure: copper, for instance, scales with the application, and yields fumes; and silver

turns the yellow white. Nor must the plate be made entirely flat; for in such case the enamel cracks; to avoid which, they usually forge them a little convex, and not too thick. The plate being well, and evenly, forged, they begin the operation by laying on a couch of white enamel, on both sides, which prevents the metal from swelling and blistering; and this coat serves for the ground of all the other colours. The plate being thus prepared, they begin at first by drawing out exactly the subject to be painted, with red vitriol, mixed with oil of spike, marking all parts of the design very lightly with a small pencil. After this, the colours (which are to be previously ground with water in a mortar of agate extremely fine, and mixed with oil of spike somewhat thick) are to be laid on, observing the mixtures and colours that agree to the different parts of the subject; for which it is necessary to understand painting in miniature. Great caution is necessary as to the qualities of the oil employed in preparing the colours, for it is very subject to adulterations. Great care must likewise be taken that the least dust imaginable come not to the colours while grinding or using them; for the least speck, when it is worked up with it, and when the work comes to be put into the reverberatory to be red-hot, will leave a hole, and so deface the work. When the colours are all laid, the painting must be gently dried over a slow fire to evaporate the oil, and the colours afterwards melted to incorporate them with the enamel, making the plate red-hot in a fire such as enamelers use. Afterwards, that part of the painting must be passed over again, which the fire has any way effaced, strengthening the shades and colours, and committing it again to the fire, observing the same method as before, which is to be repeated till the work is finished.

The white enamel, of which the glazing of fine earthen-ware vessels consists, is made of 100 parts of lead melted with from 15 to 40 parts of tin, and the mixture is oxydized completely, by exposing it to the heat in an open vessel. 100 parts of this oxide are mixed with an equal quantity of white sand, three parts of silica, one of talc, and 25 of common salt. This mixture is melted, then reduced to powder, and formed into a kind of paste, which is spread over the porcelain vessel before it is baked. The excellence of good enamel is, that it easily fuses into a kind of paste at the heat which is necessary for baking porcelain, and spreads equally on the vessel, forming a smooth glassy surface, without losing its opacity, or flowing completely into a glass. Its whiteness depends on the proportion of tin, and fusibility on the lead.

To prepare the flux or principal matter for enamelling on glass vessels.—Take one pound

of *saturnus glorificatus* (and prepare glorificatus, thus: take litharge of white lead, put it in a pan, pour on distilled vinegar, stirring it well over a gentle fire till the vinegar becomes impregnated with the salt of lead; evaporate half the vinegar, put it in a cool place to crystallize, and keep the crystals dry for use); half a pound of natural crystal calcined to a whiteness; one pound of salt of pulverine, or other fit alkali; mix them together, and bake in a slow heat for about twelve hours, then melt the mass, and pulverize the same in an agate mortar, or any other proper vessel which is not capable of communicating any metallic or other impurity.

To make green.—Take one ounce of copper-dust, two ounces of sand, one ounce of litharge, half an ounce of nitre; or two of copper, one of sand, two of litharge, one and a half of nitre; mix them with equal parts of flux, or vary the proportions of them, as may be found necessary, according to the tint of the colour required.

To make black.—Take calcined iron one ounce; cobalt, crude or prepared, one ounce; or zaffer, two ounces; and manganese one ounce; mix these well together with equal parts of flux, by melting or grinding together.

To make yellow.—Take of lead and tin ashes one ounce, litharge one ounce, antimony one ounce, sand one ounce, nitre four ounces; calcine or melt them together; pulverize and mix them with a due proportion of flux, as the nature of the glass may require; or take more, or less, of any or all the above, according to the depth of colour desired.

To make blue.—Take prepared cobalt one ounce, sand one ounce, red lead one ounce, nitre one ounce, flint-glass two ounces; melted together by fire, pulverized and fluxed according to the degree of softness or strength of colour required.

To make olive.—Take one ounce of the blue, as prepared above, half an ounce of black, half an ounce of yellow; grind them for use: if necessary, add flux to make it softer.

To make white.—Take tin, prepared by aqua-fortis, one ounce; red lead, one ounce; of white pebble-stone or natural crystal, two ounces; nitre, one ounce; arsenic, one drachm; with equal parts of flux, or more or less, as the softness or opacity may require; melted, calcined, or used raw.

To make purple.—Take the finest gold, dissolve it in aqua-regia, regulated with sal ammoniac; put it in a sand-heat for about forty-eight hours to digest the gold, collect the powder, grind it with six times its weight of sulphur, put it into a crucible on the fire till the sulphur is evaporated, then amalgamate the powder with twice its weight of mercury, put it into a mortar or other vessel, and rub it together for about six hours, with

a small quantity of water in the mortar, which change frequently; evaporate the remaining mercury in a crucible, and add to the powder ten times its weight of flux, or more, or less, as the hardness or softness of the colour may require.

To make rose-colour.—Take purple as prepared above, mix it with thirty times its weight of flux, and 100th part of its weight of silver leaf, or any preparation of silver, or vary the proportion of the flux and silver as the quality of the colour may require: or any of the other preparations for purple will do, varying the proportion of the flux and silver as above; or any materials from which purple can be produced, will, with the addition of silver and flux, answer.

To make brown.—Take red lead one ounce, calcined iron one ounce, antimony two ounces, litharge two ounces, zaffer one ounce, sand two ounces, calcined or melted together, or used raw, as may be most expedient; or vary the proportions of any or all the above, as tint or quality may require.

Method of application.—The aforesaid colours may be applied to vessels of glass in the following manner, viz. by painting, printing, or transferring, dipping, floating, and grounding.

To paint.—Mix the colours (when reduced by grinding to a fine powder) with spirit of turpentine, temper them with thick oil of turpentine, and apply them with a camel's-hair pencil, or any other proper instrument; or mix them with nut or spike oil, or any other essential or volatile oil, or with water, in which case use gum-arabic, or any other gum that will dissolve in water, or with spirits, varnishes, gums of any kind, waxes, or resins; but the first is conceived to be the best.

To print.—Take a glue bat, full size, for the subject, charge the copper-plate with the oil or colour, and take the impression with the bat from the plate, which impression transfer to the glass: if the impression is not strong enough, shake some dry colour on it, which will adhere to the moist colour; or take any engraving or etching, or stamp, or cast, and having charged it with the oil or colour, transfer it to the glass by means of prepared paper, vellum, leather, or any other substance that will answer; but the first is the best. Any of the aforesaid engravings, etchings, stamps, casts, or devices may be charged with waters, oils, varnishes, or glutinous matters of any kind, reduced to a proper state, as is necessary in printing in general; any or all of these may be used alone, or mixed with the colours. When used alone, the colour is to be applied in powder, as before mentioned.

To dip.—Mix the colour to about the consistency of a cream with any of the ingredients used for printing, in which dip

the glass vessel, and keep it in motion till smooth.

To ground.—First, charge the glass vessel with oil of turpentine, with a camel's-hair pencil, and while moist apply the colour in a dry powder, which will adhere to the oil; or, instead of oil of turpentine, use any of the materials used for printing; but the first is the best.

To float.—Mix the colour, with any of the ingredients used for printing, to a consistency according to the strength of ground required, float it through a tube, or any other vessel, moving or shaking the piece of glass till the colour is spread over the part required.

ENCHASING, INCHASING, or CHASING, the art of enriching and beautifying gold, silver, and other metal work, by some design or figures represented thereon in low relieve.

Enchasing is practised only on hollow thin works, as watch-cases, cane-heads, tweezer-cases, &c. It is performed by punching, or driving out, the metal to form the figure from withinside, so as to stand out prominent from the plane or surface of the metal. In order to this, they provide a number of fine steel blocks or puncheons of different sizes, and the design being drawn on the surface of the metal, they apply the inside upon the heads or tops of these blocks, directly under the lines or parts of the figures; then with a fine hammer, striking on the metal, sustained by the block, the metal yields, and the block makes an indenture or cavity on the inside, corresponding to which there is a prominence on the outside, which is to stand for that part of the figure. Thus the workman proceeds to chase and finish all the parts by successive application of the block, and hammer, to the several parts of the design. And it is wonderful to observe with what beauty and justness, by this simple piece of mechanism, the artists in this line will represent foliages, grotesques, animals, histories, &c.

ENDORSE, ENDORSEE, ENDORSER, &c. See **BILLS OF EXCHANGE**.

ENGINE, is a generic term in mechanics, comprehending all descriptions of large compound machines for raising, projecting, and sustaining, weights; or producing other compound effects by artificial means. Thus we have *Fire Engines, Steam Engines, Mine and Mill Engines, &c. &c.*

The fire-engine is properly a forcing-pump; and the motion of the water effected by the pressure of the atmosphere, the force of men acting upon the extremities of a lever, and thence giving motion to two pistons, and by the elasticity of condensed air in the following manner: there are two barrels, and two pistons, situated at each extremity of the engine; when one piston is raised, a vacuum would be made in the bar-

rel in which it operates, if the water did not follow it from a canal which is the undermost part of the engine (through a valve), which rises through a tube, immersed in the water of a vessel by the pressure of the atmosphere on its surface. The water of the barrel, by the succeeding depression of the piston, shuts the valve, and is forced, through a superior canal, to enter by another valve into the air-vessel, which is situated exactly in the middle of the engine; and the like being done alternately with respect to the other barrel and piston, the air-vessel is, by these means, continually filling with water, which greatly compresses the air above the surface of the water in that vessel, and thereby proportionally augments its spring; which, at length, is so far increased, as to re-act with great force on the surface of the subjacent water, and compel it to ascend through a small tube to a stop-cock, where upon turning the cock the water is suffered to pass through a pipe fixed at the top of the engine to a ball and socket; from the orifice of which it issues in a continued stream with a great velocity to a considerable height or distance; and it is usually kept from diverging too soon in its progress, by means of a long series of flexible leather pipes, properly joined together, and known among firemen by the name of the hose.

The greatest artifice in the engine, according to the construction just described, is the contrivance to produce a continual stream, which is done by the compression, and proportional elasticity, of air in the barrel, called the air-vessel. For the air, being an elastic fluid, will be susceptible of compression in any degree by the water forced in through those valves, by which the water is made to pass immediately from the barrels, at the extremities, into the air-vessel; and since the force of the air's spring will always be inversely as the space it possesses, it follows, that when the air-vessel is half full of water, the air will be compressed into half the space it possessed at first, and therefore its spring will be twice as great as at first.

But this spring at first was equal to the pressure of the atmosphere on the same surface; for if it was not, it could not have sustained or resisted the pressure of the atmosphere which stood over it, and consequently could not have filled the vessel before the water was driven in; which yet we find it did, and maintained an equilibrium with the common air. The vessel then being half-filled with water, or the air compressed into half the first space, its spring will in this case be equal to twice the pressure of the atmosphere; and therefore when the stop-cock is turned, the air within, pressing on the subjacent water with twice the force it meets with from the external air in the small tube mentioned above, will cause the water to

spout out of the engine to the height of 32 or 33 feet, if the friction is not too great.

When the air-vessel is two-thirds full of water, the air takes up one-third part; whence its spring will be three times as great at that of the common air, and it will project the water with twice the common atmospheric pressure; consequently it will rise to the height of 62 or 64 feet. When the air-vessel is three-fourths full of water, the air will be compressed into its one-fourth part, and so will protrude the water with three times the atmospheric pressure, and carry it to the height of 96 or 99 feet. Hence it will be easy to state the law by which the spring of the air will act on the surface of the water below it, as in the following table:

Height of water in air-bar.	Of the air compressed.	Proportion of air's elasticity.	Height of the spout.
1-half.	1-half.	2	33
2-3ds.	1-3d.	3	66
3-4th.	1-4th.	4	99
4-5th.	1-5th.	5	132
5-6th.	1-6th.	6	165
6-7th.	1-7th.	7	198
7-8th.	1-8th.	8	231
8-9th.	1-9th.	9	264
9-10th.	1-10th.	10	297

Various alterations and improvements have been made, from time to time, in the construction of fire-engines. The contrivers of some of them secured their inventions from infringement by patents, the specifications of most of which may be seen in the Repertory of Arts and Manufactures.

A very cheap and simple fire-engine was invented in America by Mr. Benjamin Dearborn, who communicated it to the American academy of arts and sciences, in whose Memoirs for 1794, an account of it is to be found.

This machine is confined within a box set on wheels, as in the common fire-engines. The whole is made of wood, excepting the spears of the pumps, and a few bolts, &c. The advantages of this machine are, that it can be made in any place where common pumps are manufactured; the interior work will not exceed one-fourth of the price of those which are constructed on the usual plan; and they are incomparably more easy to work than the common ones: circumstances which strongly recommend the American fire-engine to the attention of the public.

Engine, pile, a machine by which piles are driven into the earth for the foundations of piers, and other structures, with extraordinary celerity.

The contrivance consists in drawing up a

great weight, called a ram or hammer, to a certain height, and then letting it fall freely with a considerable momentum upon the head of the pile. The simple mode is to draw up the ram, by pulling at a cord running over a fixed pulley, and suffering the cord to slip when the weight is sufficiently elevated. The complex engine does the same sort of service in a better, and more expeditious, manner.

The weight, called the ram or hammer, may be raised with the least force; and when it is raised to a proper height, it readily disengages itself and falls with the utmost freedom: then the forceps or tongs are lowered down speedily, which instantly of themselves again lay hold of the ram and lift it up.

Engine, steam. The steam-engine is one of the noblest monuments of human ingenuity. It was originally invented by the marquis of Worcester, in the reign of Charles II.

Towards the end of that century, a Captain Savary, having probably seen the account of the marquis of Worcester's invention, was convinced of its practicability, and succeeded in constructing a machine of this kind. He obtained a patent for the invention, and erected several steam-engines, which he described in a book entitled "*The Miner's Friend*," published in 1696.

Savary succeeded in raising water to small heights, and erected several engines in different parts of England; but he could make nothing of deep mines.

In the beginning of the eighteenth century, Newcomen, an ironmonger or smith, and Crauly, a glazier at Dartmouth, in Devonshire, first conceived the project of applying other machinery. They were contented to share the profits of the invention with Savary, who procured a patent for it in 1705, in which they were all three joined.

Newcomen's engine was first offered to the public in 1705. But many difficulties occurred in the execution of it, which were removed one by one; and it was not till 1712, that the engine seemed to give confidence in its efficacy.

About 1762, Mr. Watt began to turn his attention to this machine, which has since then been brought to a great degree of perfection.

But before we explain Mr. Watt's engines, it is necessary to premise a short account of the imperfections of the old steam-engines, and their causes.

The steam or vapour, which arises from water confined in a close vessel, and heated a few degrees above the point at which it boils in the open air, becomes an elastic fluid, uniform, and transparent, about half the gravity of atmospheric air, very much greater in bulk than the water of which it is composed, and capable of being again reduced to water, when brought into contact with matter of a less degree of heat than itself.

The pressure of the atmosphere, or any equivalent resistance, prevents the production of steam, until the water is heated to 212 degrees of Fahrenheit's thermometer; but when that pressure is removed, or the water is placed in a vessel exhausted of air, steam is produced from it when it is colder than the human blood. On the contrary, if water is pressed upon by air or steam, which are more compressed than the atmosphere, a degree of heat above 212 degrees is necessary for the production of steam; and the difference of heats, at which water boils under different pressures, increases in a less proportion than the pressures themselves; so that a double-pressure requires less than a double increase of sensible heat.

The experiments which have been published concerning the bulk of water when converted into steam are erroneous; and the conclusions drawn from them make that bulk greater than it really is. It has been known for some time, that water would boil in an exhausted receiver at a low degree of heat.

If we consider the common steam-engine, we shall find it defective; first, because the vacuum is produced by throwing cold water into the cylinder to condense the steam: that water becomes hot, and, being in a vessel partially exhausted, produces a steam, which in part resists the pressure of the atmosphere upon the piston, and lessens the power of the engine. The second defect is the destruction of steam, which unavoidably happens upon attempting to fill a cold cylinder with that fluid; for the injection-water, at the same time that it condenses the steam, not only cools the cylinder, but remains there until it is extruded, at the education-pipe, by the steam which is let in to fill the cylinder for the next stroke; and that steam will be condensed into water as fast as it enters, until all the matter it comes in contact with is nearly as hot as itself.

Every attempt to make the vacuum more perfect by the addition of injection-water, will cool the cylinder more effectually, and cause a greater destruction of steam in the next filling; and, if the engine has already a proper load, the destruction of steam will proceed in a greater ratio than the increase of power by the amendment of the vacuum.

Though it appears that the constructors of steam-engines have never investigated these causes, yet they have been so sensible of the effects, that a judicious engineer does not attempt to load his engine with a column of water heavier than seven pounds for each square inch of the area of the piston.

Mr. Watt's improvements are founded upon these, and some other collateral, observations. He preserves an uniform heat in the cylinder of his engines, by suffering no cold water to touch it; and by protecting it from the air, or other cold bodies, by a surrounding case filled with the steam, or with

hot air or water, and by coating it over with substances that transmit heat slowly. He makes his vacuum to approach nearly that of the barometer, by condensing the steam in a separate vessel, called the condenser; which may be cooled at pleasure, without cooling the cylinder, either by injection of cold water, or by surrounding the condenser with it, and generally by both. He extracts the injection-water and detached air from the cylinder or condenser by pumps, which are wrought by the engine itself; or he blows it out by the steam.

As the inside of the cylinder was, in the old engine, exposed to the air at every stroke when the piston descended, and was considerably cooled thereby, he encloses the top of the cylinder by a metal plate, having a hole in it, through which the piston-rod works in a collar of leathers; and instead of employing the pressure of the atmosphere to force down the piston, he introduces the steam above the piston when the vacuum is formed underneath, and employs it to produce this effect: thus making the direct pressure of the steam the moving power, as in the original construction of the engine.

The last great improvement made by Mr. Watt, was his giving an impulse to the piston by the steam, both in descending, and ascending, instead of being impelled, as in the old engine, during the descent of the piston only.

Having thus briefly mentioned the principal improvements made in the steam-engine by Mr. Watt, we shall proceed to describe one of his engines on the latest construction.

To the boiler Mr. Watt has paid very great attention. It is generally of an oblong form; and the flame, after striking on its concave bottom, circulates round the sides, and sometimes returns in a pipe through the body of the water before it is suffered to go up into the chimney. In his engines there are commonly two of these boilers, so that one of them may work while the other is repairing. A steam-pipe conveys the steam from the boiler to a cylinder which is cased, and closed at top by a plate, having a collar of leather through which a piston-rod works. There are two steam-valves, through which the steam enters into the cylinder: it is admitted through an upper valve, when it is to press the piston downwards; and through a lower one, when it presses it upwards. There are two education-valves, through which the steam passes from the cylinder into the condenser, which is a separate vessel placed in a cistern of cold water, and which has a jet of cold water continually playing up in the inside of it. There is one air-pump, to extract the fire and water from the condenser: it is worked by a great beam or lever; and the water brought by it from the condenser, after being brought into a hot-well, is pumped

up again by the pump communicating with the well, and is brought back again into the boiler by a pipe passing from the top of the aforesaid pump to the boiler. Another pump is also worked by the engine itself, which supplies the cistern in which the condenser is placed with cold water.

In the old engines, where the working-stroke was always downwards, the piston-rod was attached to the beam by chains, which bent round an arch on the end of the beam, in order to make the piston-rod move always in a perpendicular direction. But in Mr. Watt's engines, where the working-stroke is doubled, that is, both upwards and downwards, chains could not answer this purpose, as, when the piston was forced upwards they would slacken, and would not communicate the motion to the beam. It was necessary, therefore, that the piston-rod should be fastened to the beam by inflexible bars; but that the stroke might be perpendicular, a particular contrivance was invented by Mr. Watt, which answers the intended purpose admirably. It is usually called the parallel joint. In order to make the engine itself open, and shut, the steam and education valves, long levers are attached to them, which are moved by the piston-rod of the air-pump. This part of the apparatus is called the working-geer, and is so contrived, that the valves may be worked either by hand, or by the perpendicular rod. By shutting these valves, the engine may be stopped in an instant.

In order to communicate a rotatory motion to any machinery by the motion of the beam of the steam-engine, Mr. Watt made use of a very large fly-wheel; on the axis of which is a small concentric toothed wheel. A similar toothed wheel is fastened by straps to a rod coming from the end of the beam, so that it cannot turn round on its axis, but must rise, and fall, with the motion of the great beam.

A bar of iron connects the centres of these two small toothed wheels, so that they cannot quit each other. When, therefore, the beam raises the second small concentric toothed wheel, it must move round the circumference of the first wheel, and turn it together with the fly; and it will be evident upon consideration, that the fly, driven in this manner, will make two revolutions, for every one of the second wheel. This mode of moving the fly is preferable to a crank; as it goes with twice the velocity. This contrivance is called the sun and planet wheel, from the resemblance of the motion to that of those luminaries.

It would far exceed the limits of this work to enter into an examination of all the steam-engines invented by different persons. It is sufficient to mention, that no engine of this kind has been found, upon careful trial, to be superior to those of Mr. Watt.

From this brief description of the steam-

engine, the reader will be enabled to perceive the nature, and appreciate the value, of Mr. Watt's improvements. It had hitherto been the practice to condense the steam in the cylinder itself, by the injection of cold water; but the water which is injected acquires a considerable degree of heat from the cylinder, and being placed in air highly rarified, part of it is converted into steam, which resists the piston, and diminishes the power of the engine. When the steam is next admitted, part of it is converted into water by coming in contact with the cylinder, which is of a lower temperature than the steam, in consequence of the destruction of its heat by the injection-water. By condensing the steam, therefore, in the cylinder itself, the resistance to the piston is increased by a partial reproduction of this elastic vapour, and the impelling power is diminished by a partial destruction of the steam which is next admitted. Both these inconveniences Mr. Watt has in a great measure avoided, by using a condenser separate from the cylinder, and encircled with cold water; and by surrounding the cylinder with a wooden case, and interposing light wood-ashes, in order to prevent its heat from being abstracted by the ambient air.

The greatest of Mr. Watt's improvements consists in his employing the steam both to elevate, and depress, the piston. In the engines of Newcomen, and others, the steam was not the impelling power: it was used merely for producing a vacuum below the piston, which was forced down by the pressure of the atmosphere, and elevated by the counterweight at the farther extremity of the great beam. The cylinder, therefore, was exposed to the external air at every descent of the piston, and a considerable portion of its heat being thus abstracted, a corresponding quantity of steam was of consequence destroyed. In Mr. Watt's engines, however, the external air is excluded by a metal plate at the top of the cylinder, which has a hole in it for admitting the piston-rod; and the piston itself is raised and depressed merely by the force of steam.

When these improvements are adopted, and the engine is constructed in the most perfect manner, there is not above $\frac{1}{4}$ th part of the steam consumed in heating the apparatus; and, therefore, it is possible that the engine can be rendered $\frac{1}{4}$ th more powerful. It would be very desirable, however, that the force of the piston could be properly communicated to the machinery without the intervention of the great beam. This, indeed, has been attempted by Mr. Watt, who has employed the piston-rod itself to drive the machinery; and a Mr. Cartwright has, in his engine, converted the perpendicular motion of the piston into a rotatory motion, by means of two cranks

fixed to the axis of two equal wheels which work in each other. Notwithstanding the simplicity of these methods, none of them have come into general use; and Mr. Watt still prefers the intervention of the great beam, which is generally made of hard oak, with its heart taken out, in order to prevent it from warping. A considerable quantity of power, however, is wasted by dragging, at every stroke of the piston, such a mass of matter from a state of rest to a state of motion, and then from a state of motion to a state of rest. To prevent this loss of power, a light frame of carpentry has been employed by several engineers, instead of the solid beam: but after being used for some time, the wood was generally cut by the iron bolts, and the frame itself was often instantaneously destroyed. In some of the engines constructed by Mr. Watt, he formed the great beam of cast iron; and while he thus added to its durability, he at the same time diminished its weight, and increased the power of his engine.

Encouraged by Mr. Watt's success, several improvements upon the steam-engine have been attempted by Hornblower, Trevethick, and many other engineers of this country. But it does not appear that they have either increased the power of the engine, or diminished its expense. It appears, on the contrary, that many of these pretended improvements, excepting those of Hornblower, consist merely in having adopted Mr. Watt's discoveries, in such a manner as not to infringe upon his patent.

Some years since, a Mr. Arthur Woolf announced to the public a discovery respecting the expansibility of steam. Mr. Watt had formerly ascertained, that steam which acts with the expansive force of four pounds per square inch, against a safety-valve exposed to the weight of the atmosphere, after expanding itself to four times the volume it thus occupies, is still equal to the pressure of the atmosphere. But Mr. Woolf has gone much farther, and has proved that quantities of steam, having the force of 5, 6, 7, 8, 9, 10, &c. pounds on every square inch, may be allowed to expand 5, 6, 7, 8, 9, 10, &c. times its volume, and will still be equal to the atmosphere's weight, provided that the cylinder in which the expansion takes place, has the same temperature as the steam before it began to expand. It is evident, however, that an increase of temperature is necessary both to produce, and maintain, this augmentation of the steam's expansive force above the pressure of the atmosphere. At the temperature of 212° of Fahrenheit, the force of steam is equal only to the pressure of the atmosphere; and in order to give it an additional elastic force of five pounds per square inch, the temperature must be increased to about $227\frac{1}{2}^{\circ}$; when it will have acquired a power to expand itself to five

times its volume, and still be equal in pressure to the atmosphere, and capable of being applied as such in the working of steam-engines, according to his invention. The ratio of other pressures, temperatures, and expansive forces of steam, is shown in the following table; which gives the relative

pressure per square inch, temperatures, and expansibility of steam, at degrees of heat above the boiling point of water; beginning with a temperature of steam of an elastic force equal to five pounds per square inch, and extending to steam able to sustain forty pounds on the square inch.

Table of the Pressures, Temperatures, and Expansibility of Steam, equal to the Force of the Atmosphere.

Elastic force of steam predominating over the pressure of the atmosphere, and acting upon a safety-valve.	Degrees of temperature requisite for bringing the steam to the different expansive forces in the preceding column.	No. of times its volume that steam of the preceding force and temperature will expand, and still continue equal to the pressure of the atmosphere.
Pounds per square inch.	Degrees of heat.	Expansibility.
5	227 $\frac{1}{2}$	5
6	230 $\frac{3}{4}$	6
7	232 $\frac{3}{4}$	7
8	235 $\frac{1}{4}$	8
9	237 $\frac{1}{2}$	9
10	239 $\frac{1}{2}$	10
15	250 $\frac{1}{2}$	15
20	259 $\frac{1}{2}$	20
25	267	25
30	273	30
35	271	35
40	282	40

In this manner, by small additions of temperature, an expansive power may be given to steam, which will enable it to expand 50, 100, 200, 500, &c. times its volume, and still have the same force as the atmosphere.

Upon this principle Mr. Woolf took out a patent for various improvements on the steam-engine; the words of the specification are as follow:

“If the engine be constructed originally with the intention of adopting the preceding improvement, it ought to have two steam-vessels of different dimensions, according to the expansive force to be communicated to the beam, for the smaller steam-cylinder must be a measure for the larger. For example, if steam of forty pounds the square inch is fixed on, then the smaller steam-vessel should be at least one-fortieth part the contents of the larger one. Each steam-vessel should be furnished with a piston, and the smaller cylinder should have a communication both at its top and bottom, with the boiler which supplies the steam; which communications, by means of cocks or valves, are to be alternately opened and shut during the working of the engine. The top of the small cylinder should have a communication with the bottom of the larger cylinder, and the bottom of the smaller one with the top of the larger, with

proper means to open and shut these alternately by cocks, valves, or any other contrivance. And both the top and bottom of the larger cylinder should, while the engine is at work, communicate alternately with a condensing vessel, into which a jet of water is admitted to hasten the condensation. Things being thus arranged, when the engine is at work, steam of a high temperature is admitted from the boiler to act by its elastic force on one side of the smaller piston, while the steam which had last moved it has a communication with the larger cylinder, where it follows the larger piston now moving towards that end of its cylinder which is open to the condensing vessel. Let both pistons end their stroke at one time, and let us now suppose them both at the top of their respective cylinders ready to descend; then the steam of 40 pounds the square inch, entering above the smaller piston, will carry it downwards, while the steam below it, instead of being allowed to escape into the atmosphere, or applied to any other purpose, will pass into the larger cylinder above its piston, which will take its downward stroke at the same time that the piston of the smaller cylinder is doing the same thing; and, while this goes on, the steam which last filled the larger cylinder, in the upward stroke of the engine, will be passing into the condenser, to be condensed

in the downward stroke. When the pistons in the smaller and larger cylinders have thus been made to descend to the bottom of their cylinders, then the steam from the boiler is to be shut off from the top, and admitted to the bottom of the smaller cylinder, and the communication between the bottom of the smaller, and the top of the larger cylinder, is also to be cut off, and the communication to be opened between the top of the smaller and the bottom of the larger cylinder; the steam which, in the downward stroke of the engine, filled the larger cylinder, being now opened to the condenser, and the communication between the bottom of the larger cylinder and the condenser cut off; and so on alternately, admitting the steam to the different sides of the smaller piston, while the steam last admitted into the smaller cylinder passes alternately to the different sides of the larger piston in the larger cylinder, the top and bottom of which are made to communicate alternately with the condenser.

“ In an engine where these improvements are adopted, that waste of steam which arises in other engines from steam passing the piston, is totally prevented; for the steam which passes the piston in the smaller cylinder, is received into the larger.”

Mr. Woolf has also shown how the preceding arrangement may be altered, and has pointed out various other modifications of his invention, and the method of applying his improvements to steam-engines which are already constructed.

On the power of steam-engines, and the method of computing it.

From the account which has been given of the steam-engine, and the mode of its operation, it must be evident that its power depends upon the breadth and height of the cylinder, or, in other words, on the area of the piston, and the length of its stroke. If we suppose that no force is lost in overcoming the inertia of the great beam, and that the lever by which the power acts, is equal to the lever of resistance; then, if steam of a certain elastic force is admitted above the piston, so as to press it downwards with a force of little more than 100 pounds, it will be able to raise a weight of 100 pounds hanging at the end of the great beam. When the piston has descended to the bottom of the cylinder, through the space of four feet, the weight will have risen through the same space; and 100 pounds raised through the height of four feet, during one descent of the piston, will express the mechanical power of the engine. But if the area of the piston, and the length of the cylinder, are doubled, while the expansive force of the steam, and the time of the piston's descent, remain the same, the mechanical energy of the engine will be

quadruple, and will be represented by 200 pounds raised through the space of eight feet during the time of the piston's descent. The power of steam-engines therefore is, *ceteris paribus*, in the compound ratio of the area of the piston, and the length of the stroke. These observations being premised, it will be easy to compute the power of steam-engines of any size.

Thus, let it be required to determine the power of steam-engines, whose cylinder is twenty-four inches diameter, and which make twenty-two double strokes in a minute, each stroke being five feet long, and the force of the steam being equal to a pressure of twelve pounds avoirdupois upon every square inch. The diameter of the piston being multiplied by its circumference, and divided by 4, will give its area in

square inches; thus $\frac{24 \times 3.1416 \times 24}{4} = 452.4$

the number of square inches exposed to the pressure of the steam. Now if we multiply this area by twelve pounds, the pressure upon every square inch, we shall have $452.4 \times 12 = 5428.8$ pounds, the whole pressure upon the piston, or the weight which the engine is capable of raising. But since the engine performs 22 double strokes, five feet long, in a minute, the piston must move through $22 \times 5 \times 2 = 220$ feet in the same time; and therefore the power of the engine will be represented by 5428.8 pounds avoirdupois, raised through 220 feet in a minute; or by 10.4 hogsheads of water, ale measure, raised through the same height in the same time.

Now this is equivalent to $5428.8 \times 220 = 1194336$ pounds, or $10.4 \times 220 = 2288$ hogsheads, raised through the height of one foot in a minute. This is the most unequivocal expression of the mechanical power of any machine whatever, that can possibly be obtained. But as steam-engines were substituted in the room of horses, it has been customary to calculate their mechanical energy in horse-powers, or to find the number of horses which could perform the same work. This indeed is a very vague expression of power, on account of the different degrees of strength which different horses possess. But still, when we are told that a steam-engine is equal to sixteen horses, we have a more distinct conception of its power, than when we are informed that it is capable of raising a number of pounds through a certain space in a certain time.

Messrs. Watt and Boulton suppose a horse capable of raising 32,000 pounds, avoirdupois, one foot high in a minute; while Dr. Desaguliers makes it 27,500 pounds, and Mr. Smeaton only 22,916. If we divide, therefore, the number of pounds which any steam-engine can raise one foot high in a minute, by these three numbers, each quotient will represent the number of horses to

which the engine is equivalent. Thus in the present example, $\frac{1194336}{32000} = 37\frac{1}{4}$ horses, according to Watt & Boulton; $\frac{1194336}{27500} = 43\frac{1}{4}$ horses, according to Desaguliers; & $\frac{1194336}{22916} = 52\frac{1}{4}$ horses, according to Smeaton. In this calculation it is supposed that the engine works only eight hours a day; so that if it wrought during the whole twenty-four hours, it would be equivalent to thrice the number of horses found by the preceding rule.

Except for the propulsion of boats, for culinary concerns, and for the heating of conservatories, we are not aware of any extraordinary improvements on the subject of steam, sufficiently important to call upon us for notice, more recent than those we have been considering, in addition to *that*, with which we mean to conclude this article. In 1812, a patent was obtained by a Mr. Witty, of Kingston-upon-Hull, for improvements upon the steam-engine.

The improvements described in the specification, are, in fact, additions to, or alterations in, another specification, which the patentee presented something more than two years before; to which we must refer the reader for further information.

These recent improvements consist in making the piston draw, or force, the machinery to be worked by it, whilst itself moves both in a rectilinear, and rotary direction, in a cylinder or steam-vessel, which also revolves upon an axis placed either in a horizontal, vertical, or oblique position. The mechanical contrivances, by which this is effected, are of various kinds, but not within the compass of description here.

Mr. Witty observes, in addition to the remarks made in his other specification, "I retain the principle formerly described, *viz.* a revolving cylinder and piston, with the mode of communicating steam to them. But I dispense with heavy pistons, and now apply the force of the steam directly, with, or without, condensation. I have pointed out how this power may be applied, and how to regulate and connect the piston-rod with the machinery. The advantages which this engine possesses are obvious. The combination of rectilinear, with rotary, motion is simple. The beam, its parallel apparatus, the hand-gear, valves, and plug-frame, are entirely done away; and the consequent loss of power, arising from their alternate motion, avoided. The ponderous fly-wheel, used to regulate the motion, is in a great measure dispensed with."

For the scientific and inquisitive, this is sufficient notice to take of the subject; and

to those of any other description it will perhaps be considered as even too much.

ENGINE to lower heavy weights, known by the name of a *crane*, is too well known, to render any explanation necessary.

Engines in mines, mills, and manufactories, are protected by divers statutes.

By 9 Geo. 3. c. 29. pulling down and destroying them is made felony *sans* clergy.

By 41 Geo. 3. c. 24. damages done to them may be recovered from the hundred.

By 52 Geo. 3. both these former statutes are confirmed, and their provisions extended.

By 56 Geo. 3. c. 73. all these statutes are recited, their provisions extended, and the proceedings more distinctly specified. 3 *Dict. Pract. Expos.* 536.

By 3 Geo. 4. no action shall be brought against the hundred, &c. where the damages are less than 50*l.*; in which case, summary redress before magistrates is given.

ENGRAVER. The business of an engraver is generally divided into several branches: thus those who engrave maps, generally engrave nothing but the maps and words, and send the ornament, which surrounds the title, to be done by another hand; those who engrave ornaments, and other devices, seldom engrave portraits; and there are some who engrave landscapes only.

Engravers who shall invent, design, and engrave prints, are to have the sole right of printing them for fourteen years, and they shall be engraved with the names of the proprietors; and others copying and selling such prints, though by varying, &c. without their consent, shall forfeit 5*l.* for every print, and also the plates and sheets, &c. Stat. 8 Geo. 2. c. 15., extended by 17 Geo. 3. c. 57.

ENGRAVING, the art of cutting wood, metals, and precious stones, and representing thereon figures, letters, or whatever device or design the artist fancies. Engraving, properly a branch of sculpture, is divided into several other branches, according to the matter whereon it is employed, and the manner of performing it. Engraving, or *graving*, as it is generally called, is the cutting lines upon a copper-plate, by means of a steel instrument, called a graver, without the use of aqua-fortis. This was the first mode of producing copper-plate prints, that was practised; and it is still much used in historical subjects, portraits, and in finishing landscapes. The tools necessary for this art are gravers, a scraper, a burnisher, an oil-stone, a sand-bag or cushion, an oil-rubber, and some good charcoal. The *gravers* are instruments of tempered steel, fitted into a short wooden handle. They are of two sorts, square, and lozenge: the first is used in cutting very broad strokes, and the other for fainter and more delicate lines. The *scraper* is a three-edged tool, for scraping off

the burr raised by the graver. *Burnishers* are for rubbing down any lines that are too deep, or burnishing out any scratches or holes in the copper: they are of very hard steel, well rounded and polished. The *oil-stone* is for whetting the gravers, etching-points, &c. The *sand-bag*, or cushion, is for laying the plate upon, for the convenience of turning it round in any direction. The *oil-rubber* and *charcoal*, are for polishing the plate when necessary.

As great care is required to whet the graver nicely, particularly the belly of it, care must be taken to lay the two angles of the graver, which are to be held next the plate, flat upon the stone, and rub them steadily, till the belly rises gradually above the plate; so that, when you lay the graver flat upon it, you may just perceive the light under the point; otherwise it will dig into the copper, and then it will be impossible to keep a point, or execute the work with freedom. In order to this, keep your right arm close to your side, and place the fore-finger of your left hand upon that part of the graver which lies uppermost on the stone. When this is done, in order to whet the face, place the flat part of the handle in the hollow of your hand, with the belly of the graver upwards, upon a moderate slope, and rub the extremity, or face, upon the stone, till it has an exceedingly sharp point, which you may try upon your thumb-nail. When the graver is too hard, as is usually the case when first bought, and may be known by the frequent breaking of the point, the method of *tempering* it is as follows:—Heat a poker red-hot, and hold the graver upon it, within half an inch of the point, till the steel changes to a light straw-colour; then put the point into oil, to cool; or hold the graver close to the flame of a candle, till it be of the same colour, and cool it in the tallow; but be careful either way not to hold it too long, for then it will be too soft; and in this case the point, which will then turn blue, must be tempered again. Be not too hasty in tempering; for sometimes a little whetting will bring it to a good condition, when it is but a little too hard. To hold the graver, cut off that part of the handle which is upon the same line with the belly, or sharp edge of the graver; making that side flat, that it may be no obstruction. Hold the handle in the hollow of your hand, and, extending your fore-finger towards the point, let it rest on the back of the graver, that you may guide it flat and parallel with the plate. Take care that your fingers do not interpose between the plate and the graver; for they will hinder you from carrying the graver level with the plate, and from cutting your strokes so clean as they ought to be. To lay the design upon the plate, after you have polished it fine and smooth, heat it so that it will melt virgin-wax, with which rub it

thinly and equally over, and let it cool. Then the design which you lay on, must be drawn on paper with a black-lead pencil, and laid upon the plate with its pencilled side upon the wax: then press it to, and with a burnisher go over every part of the design; and when you take off the paper, you will find every line which you drew with the black-lead pencil upon the waxed plate, as if it had been drawn: then, with a sharp-pointed tool, trace all your design through the wax upon the plate, and you may then take off the wax, and proceed to work. Let the table or board you work at be firm and steady; upon which place your sand-bag with the plate upon it; and holding the graver as above directed, proceed in the following manner:—

For straight strokes, hold your plate firm upon the sand-bag with your left hand, moving your right hand forwards; leaning lighter where the stroke should be fine, and harder where you would have it broader. For circular or crooked strokes, hold the graver steadfast, moving your hand, or the plate, as you see convenient. Learn to carry your hand with such dexterity, that you may end your stroke as finely as you began it; and if you have occasion to make one part deeper or blacker than another, do it by degrees; and that you may do it with greater exactness, take care that your strokes be not too close nor too wide. In the course of your work, scrape off the roughness which arises with your scraper; but be careful, in doing this, not to scratch the plate; and that you may see your work properly as you go on, rub it with the oil-rubber, and wipe the plates clean; which will take off the glare of the copper, and show what you have done to the best advantage. Any mistakes or scratches in the plate may be rubbed out with the burnisher, and the part levelled with the scraper, polishing it again afterwards lightly with the burnisher, or charcoal. Having thus attained the use of the graver, according to the foregoing rules, you will be able to finish any piece previously etched by graving up the several parts to the colour required; beginning, as in the etching, with the fainter parts, and advancing gradually with the stronger, till the whole is complete. See ETCHING.

The *dry point*, or needle, (so called, because not used till the ground is taken off the plate,) is principally employed in the extremely light parts of water, sky, drapery, architecture, &c. To prevent any obstruction from too great a degree of light, the use of a sash, made of transparent or fan paper, pasted in a frame, and placed sloping at a convenient distance between your work and the light, will preserve the sight; and when the sun shines, it cannot possibly be dispensed with.

Of mezzotinto engraving or scraping.—

This art, which is of late date, is recommended by the amazing ease with which it is executed, especially by those who understand drawing. Mezzotinto prints are those which have no patching, or strokes of the graver, but whose lights and shades are blended together, and appear like a drawing in Indian ink. They are different from aqua tinta; but as both resemble Indian ink, the difference is not easily described. Mezzotinto is applied to portraits and historical subjects, and aqua tinta is used only for landscape and architecture.

The tools necessary for mezzotinto scraping are the grounding-tool, burnishers, and scrapers.

To lay the mezzotinto ground, lay your plate, with a piece of flannel under it, upon your table: hold the grounding-tool in your hand perpendicularly; lean upon it moderately hard, continually rocking your hand in a right line, from end to end, till you have wholly covered the plate in one direction: next cross the strokes, from side to side, afterwards, from corner to corner, working the tool each time all over the plate, in every direction, almost like the points of a compass; taking all possible care not to let the tool cut (in one direction) twice in a place. This done, the plate will be full, or, in other words, all over rough alike; and would, if it was printed, appear completely black. Having laid the ground, take the scrapings of black chalk, and with a piece of rag rub it over the plate; or you may smoke it with candles, as before directed for etching. Now take your drawing, and having rubbed the back with red chalk-dust, mixed with flake-white, proceed to trace it on the plate. To form the lights and shadows, take a blunt needle, and mark out the outlines only: then with a scraper scrape off the lights in every part of the plate, as clean and smooth as possible, in proportion to the strength of the lights in your drawing, taking care not to hurt your outlines. The use of the burnisher is to soften or rub down the extreme light parts, after the scraper is done with; such as the tip of the nose, forehead, linen, &c. which might otherwise, when proved, appear rather misty, than clear. Another method used by mezzotinto-scrappers is, to etch the outlines of the original, as also the folds in drapery, making the breadth of the shadows by dots; which having bit to a proper depth with aqua fortis, they take off the ground used in etching, and having laid the mezzotinto-ground, proceed to scrape as above. When your plate is ready for taking a proof, or impression, send it to the copper-plate printer, and get it proved. When the proof is dry, touch it with white chalk where it should be lighter, and with black chalk where it should be darker: and when the print is retouched, proceed as before for the lights; and for the shades use a

small grounding-tool, as much as you judge necessary, to bring it to a proper colour; and when you have done as much as you think expedient, prove it again; and so proceed to prove and touch till it is entirely to your mind.

Engraving in aqua tinta. — Aqua tinta is a method of producing prints very much resembling drawings in Indian ink. The principle of the process consists in corroding the copper with aqua fortis, in such a manner, that an impression from it has the appearance of a tint laid on the paper. This is effected by covering the copper with a powder, or some substance which takes a granulated form, so as to prevent the aqua fortis from acting where the particles adhere; and by this means cause it to corrode the copper partially, and in the interstices only. When these particles are extremely minute and near to each other, the impression from the plate appears to the naked eye exactly like a wash of Indian ink; but when they are larger, the granulation is more distinct: and as this may be varied at pleasure, it is capable of being adapted, with great success, to a variety of purposes and subjects. This powder, or granulation, is called the aqua-tinta grain, and there are two general modes of producing it. We shall first describe what is called the powder-grain, because it was the first that was used. Having etched the outline on a copper-plate, prepared in the usual way by the coppersmith (for which see the article ETCHING), some substance must be finely powdered and sifted, which will melt with heat, and when cold will adhere to the plate, and resist the action of aqua fortis. The substances which have been used for this purpose, either separately, or mixed, are asphaltum, Burgundy pitch, rosin, gum-copal, gum-mastich; and, in a greater or less degree, all the resins and gum-resins will answer the purpose. Common rosin has been most generally used, and answers tolerably well; though gum-copal makes a grain that resists the aqua fortis better. The substance, intended to be used for the grain, must now be distributed over the plate, as equally as possible; and different methods of performing this essential part of the operation have been used by different engravers, and at different times. The most usual way is, to tie up some of the powder in a piece of muslin, and strike it against a piece of stick, held at a considerable height above the plate; by this, the powder that issues falls gently, and settles equally over the plate. Every one must have observed how uniformly hair-powder settles upon the furniture, after the operations of the hair-dresser. This may afford a hint towards the best mode of performing this part of the process. The powder must fall upon it from a considerable height, and there must be a sufficiently large cloud of dust formed.

The plate being covered equally over with the dust, or powder, the operator is next to proceed to fix it upon the plate, by heating it gently, so as to melt the particles. This may be effected by holding under the plate lighted pieces of brown paper rolled up, and moving them about till every part of the powder is melted; this will be known by its change of colour, which will turn brownish. It must now be suffered to cool, when it may be examined by a magnifier, and if the grains or particles appear to be uniformly distributed, it is ready for the next part of the process. The design or drawing to be engraved must now be examined, and such parts of it as are perfectly white are to be re-marked. Those corresponding parts of the plates must be covered, or stopped out, as it is called, with turpentine-varnish, diluted with turpentine, to a proper consistence to work freely with the pencil, and mixed with lamp-black, to give it colour; for if transparent, the touches of the pencil would not be so distinctly seen. The margin of the plate must also be covered with varnish. When the stopping out is sufficiently dry, a border of wax must be raised round the plate, in the same manner as in etching, and the aqua fortis properly diluted with water poured on. This is called biting in, and is the part of the process which is most uncertain, and which requires the greatest degree of experience. When the aqua fortis has lain on so long that the plate, when printed, would produce the lightest tint in the drawing, it is poured off, and the plate washed with water, and dried. When it is quite dry, the lightest tints in the drawing are stopped out, and the aqua fortis poured on as before, and the same process is repeated as often as there are tints to be produced in the plate. Although many plates are etched entirely by this method of stopping out, and biting in, alternately, yet it may easily be conceived, that in general, it would be very difficult to stop round, and leave out all the finishing touches; as also the leaves of trees, and many other objects, which it would be impossible to execute with the necessary degree of freedom, in this manner. To overcome this difficulty, another very ingenious process has been invented, by which these touches are laid on the plate with the same ease and expedition, as they are in a drawing of Indian ink. Fine washed whiting is mixed with a little treacle or sugar, and diluted with water in the pencil, so as to work freely: and this is laid on the plate covered with the aqua-tint ground, in the same manner, and on the same parts, as ink on the drawing. When this is dry, the whole plate is varnished over with a weak, and thin, varnish of turpentine, asphaltum, or mastich, and then suffered to dry, when the aqua fortis is poured on. The varnish will

immediately break up in the parts where the treacle mixture was laid, and expose all these places to the action of the acid, while the rest of the plate remains secure. The effect of this will be, that all the touches or places where the treacle was used, will be bit in deeper than the rest, and will have all the precision and firmness of touches in Indian ink. After the plate is completely bit in, the bordering wax is taken off, by heating the plate a little with a lighted piece of paper; and it is then cleared from the ground, and varnished by oil of turpentine, and wiped clean with a rag, and a little fine whiting, when it is ready for the printer. The principal disadvantages of this method of aqua-tinting are, that it is extremely difficult to produce the required degree of coarseness, or fineness, in the grain, and that plates so engraved do not print many impressions before they are worn out. It is therefore now very seldom used, though it is occasionally of service. We next proceed to describe the second method of producing the aqua-tint ground, which is generally practised. Some resinous substance is dissolved in spirit of wine, as common rosin, Burgundy pitch, or mastich, and this solution is poured all over the plate, which is then held in a slanting direction till the superfluous fluid drains off; and it is laid down to dry, which it does in a few minutes. If the plate is then examined with the magnifier, it will be found that the spirit, in evaporating, has left the rosin in a granulated state, or rather, that the latter has cracked in every direction, still adhering firmly to the copper. A grain is thus produced with the greatest ease, which is extremely regular and beautiful, and much superior, for most purposes, to that produced by the former method. After the grain is formed, every part of the process is conducted in the same manner, as above described.

Having thus given a general idea of the art, we shall mention some particulars necessary to be attended to, in order to insure success in the operation. The spirit of wine used for the solution, must be highly rectified, and of the best quality. What is sold in the shops, generally contains camphor, which would entirely spoil the grain. Rosin, Burgundy pitch, and gum mastich, when dissolved in spirit of wine, produce grains of a different appearance and figure: and are sometimes used separately, and sometimes mixed in different proportions, according to the taste of the artist, some using one substance, and some another. In order to produce a coarser, or a finer, grain, it is necessary to use a greater or smaller quantity of rosin; and to ascertain the proper proportions, several spare pieces of copper must be provided, on which the liquid may be poured, and the grain exa-

mined, before it is applied to the plate to be engraved. After the solution is made, it must stand still and undisturbed for a day or two, till all the impurities of the rosin have settled to the bottom, and the fluid is quite pellucid. No other method of freeing it from those impurities has been found to answer; straining it through linen or muslin, only fills it with hairs, which are ruinous to the grain. The room in which the liquid is poured on the plate, must be perfectly still, and free from dust; which, whenever it falls on the plate while wet, causes a white spot, which it is impossible to remove without laying the grain afresh. The plate must also be previously cleaned, with the greatest possible care, with a rag and whiting, as the smallest stain, or particle of grease, produces a streak or blemish in the grain. All these attentions are absolutely necessary to produce a tolerably regular grain; and, after every thing that can be done by the most experienced artists, still there is much uncertainty in the process. They are sometimes obliged to lay on the grains several times, before they procure one sufficiently regular. The same proportions of materials do not always produce the same effect, as much depends on their qualities; and something on the weather. These difficulties are not to be surmounted but by a great deal of experience; and even those, who are daily in the habit of practising the art, are frequently liable to unaccountable accidents. Indeed it is much to be lamented, that so elegant and useful a process should be so extremely delicate, and uncertain. It being necessary to hold the plate in a slanting direction, in order to drain off the superfluous fluid, there will naturally be a greater body of the liquid at the bottom than at the top of the plate. On this account, a grain laid in this way is always coarser at the lower side of the plate. The most usual way is, to keep the coarsest side for the foreground, that being generally the part which has the deepest shadows. In large landscapes, sometimes various parts are laid with different grains, according to the nature of the subject. The finer the grain is, the more nearly does the impression resemble Indian ink, and the fitter it is for imitating drawings; but very fine grains have several disadvantages; for they are apt to come off before the aqua fortis has lain on long enough to produce the desired depth; and as the plate is not corroded so deep, it sooner wears out in printing; whereas coarser grains are firmer, the acid goes deeper, and the plate will throw off a great many more impressions. The reason of all this is evident, when it is considered, that, in the fine grains, the particles are small, and near each other, and consequently the aqua fortis, which acts laterally as

well as downwards, soon undermines the particles, and causes them to come off. If left too long on the plate, the acid would eat away the grain entirely. On these accounts, therefore, the moderately coarse grains are more sought after, and answer better the purpose of the publisher, than the fine grains which were formerly in use. Although there are considerable difficulties in laying properly the aqua-tint grain, yet the corroding of the copper, or biting in, so as to produce exactly that tint required, is still more precarious and uncertain. All engravers allow that no positive rules can be laid down, by which the success of this process can be secured; nothing but a great deal of experience, and attentive observation, can enable the artist to do it with any degree of certainty. There are some hints, however, which may be of considerable importance to the person who wishes to attain the practice of this art. It is evident that the longer the acid remains on the copper, the deeper it bites, and consequently the darker will be the shade in the impression. It may be of some use, therefore, to have several bits of copper laid with aqua-tint grounds, of the same kind to be used in the plate, and to let the aqua fortis remain for different lengths of time on each; and then to examine the tints produced in one, two, three, four minutes, or longer. Observations of this kind, frequently repeated, and with different degrees of strength of the acid, will at length assist the judgment, in guessing at the tint which is produced in the plate. A magnifier is also useful to examine the grain, and to observe the depth to which it is bitten. It must be observed, that no proof of the plate can be obtained till the whole process is finished. If any part appears to have been bitten too dark, it must be burnished down with a steel burnisher; but this requires great delicacy, and good management, not to make the shade streaky; and as the beauty, and durability, of the grain are always somewhat injured by it, it should be avoided, as much as possible.

Those parts which are not dark enough, must have a fresh grain laid over them, and be stopped round with varnish, and subjected again to the aqua fortis. This is called re-biting, and requires peculiar care and attention. The plate must be very well cleaned out with turpentine, before the grain is laid on, which should be pretty coarse, otherwise it will not lie upon the heights only, as is necessary in order to produce the same grain. If the new grain be different from the former, it will not be so clear, nor so firm, but rotten.

Engraving on wood. — Engraving on wood is a process exactly the reverse to engraving on copper. In the latter, the strokes to be printed are sunk, or cut into the cop-

per, and a rolling-press is used for printing it; but in engraving on wood, all the wood is cut away, except the lines to be printed, which are left standing up like types, and the mode of printing is the same, as that used in letter-press. The wood used for this purpose is boxwood, which is planed quite smooth. The design is then drawn upon the wood itself with black lead; and all the wood is cut away with gravers, and other proper tools, except the lines that are drawn. Or sometimes the design is drawn upon paper, and pasted upon the wood, which is cut as before. The art is of considerable difficulty, and there are very few who practise it. It is, however, useful for books, as the printing of it is cheaper than that of copper-plates. It cannot be applied equally well to all the purposes, to which copper-plate engraving is applicable.

Engraving on precious stones.—In this process they use either the diamond, or emery. The diamond, which is the hardest of all stones, is only cut by itself, or with its own matter. The first thing to be done in this branch of engraving, is to cement two rough diamonds to the end of two sticks large enough to hold them steady in the hand, and rub or grind them against each other till they are brought to the desired form. The dust, or powder, that is rubbed off, serves to polish them, which is performed with a kind of mill that turns a wheel of soft iron. The diamond is fixed in a brass dish, and thus applied to the wheel, is covered with diamond-dust, mixed up with oil of olives; and when the diamond is to be cut facet-wise, they apply first one face, then another, to the wheel. Rubies, sapphires, and topazes, are cut and formed the same way on a copper wheel, and polished with tripoli diluted in water. As to agates, amethysts, emeralds, hyacinths, granites, rubies, and others of the softer stones, they are cut on a leaden wheel, moistened with emery and water, and polished with tripoli, on a pewter wheel. Lapis-lazuli, opal, &c. are polished on a wooden wheel. To fashion and engrave vases of agate, crystal, lapis-lazuli, or the like, they make use of a kind of lathe, like that used by pewterers to hold the vessels, which are to be wrought with proper tools: that of the engraver generally holds the tools, which are turned by a wheel; and the vessel is held to them to be cut and engraved, either in relief or otherwise; the tools being moistened, from time to time, with diamond-dust and oil, or at least emery and water. To engrave figures or devices on any of these stones, when polished, such as medals, seals, &c. they use a little iron wheel, the ends of whose axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought closer, or set further apart, at pleasure: at one end of the

axis are fitted the proper tools, being kept tight by a screw. Lastly, the wheel is turned by the foot, and the stone applied by the hand to the tool, and is shifted and conducted, as occasion requires. The tools are generally of iron, and sometimes of brass: their form is various; but it generally bears some resemblance to chisels, gauges, &c. Some have small round heads like buttons; others like ferules, to take the pieces out; and others flat, &c. When the stone has been engraved, it is polished on wheels of hair-brushes and tripoli.

Engraving on steel, is chiefly employed in cutting seals, punches, matrices, and dyes proper for striking coins, medals, and counters, &c. The method of engraving with the instruments, &c. is the same for coins as for medals and counters. All the difference consists in their greater or less relief, the relief of coins being much less considerable than that of medals, and that of counters still less than that of coins. Engravers in steel commonly begin with punches which are in relief, and serve for making the creux, or cavities of the matrices and dyes: though sometimes they begin with the creux, or hollowness, but then it is only when the intended work is to be cut very shallow. The first thing done, is that of designing the figures; the next is the moulding of them in wax, of the size, and depth, they are to lie, and from this wax the punch is engraved. When the punch is finished, they give it a very high temper, that it may the better bear the blows of the hammer, with which it is struck, to give the impression to the matrix. The steel is made hot to soften it, that it may the more readily take the impression of the punch; and after striking the punch on it, in this state, they proceed to touch up or finish the strokes and lines, where, by reason of their fineness, or the too great relief, they are in any wise defective, with steel gravers of different kinds, chisels, flatters, &c. being the principal instruments used in graving on steel. The figure being thus finished, they proceed to engrave the rest of the medal, as the mouldings of the border, the engrailed ring, letters, &c. with little steel punches, well tempered, and very sharp.

ENGRAVINGS are a special property in the authors of them for a certain number of years, as has been observed. See ENGRAVERS.

ENSURANCE. See INSURANCE.

ENTREPOST, or ENTREPOT, the public magazine, appointed by the sovereign or state, in most foreign countries, for the reception of all kind of merchandise imported, with a design, either to carry them through the dominions of the sovereign or state where they are debarked, or to reship them for some other country: merchandise thus

landed not being subject to the duties of import, the care of them must be confided to the officers of the customs, who give receipts for all goods thus deposited, for which a small sum is paid for the warehouse rent, &c. of them.

An *entrepot* city, is a city which trading nations make choice of as the general magazine for all sorts of merchandise destined for that part of the world where it is situated. Thus Smyrna is the magazine of the Levant, where the English, French, Dutch, and the Venetians lay up their merchandise destined for Persia, and some parts of India. Dunkirk and Ostend were likewise *entrepot* cities, as Marseilles now is.

ENTRY, *Bill of*. In making entries inwards, it is usual for merchants to include all the goods they have on board the same ship in one bill, though sometimes they may happen to be upwards of twenty several kinds, and in case the goods are short-entered, additional or post-entries are now allowed, though formerly the goods so entered were forfeited. As to bills of entry outwards, or including goods to be exported, upon delivering them, and paying the customs, you shall receive a small piece of parchment, called a *cocket*, which testifies your payment thereof, and all duties for such goods. If several sorts of goods are exported at once, of which some are free, and others pay customs, the exporter must have two *cockets*, and therefore must make two entries; one of the goods that pay, and the other of the goods that do not pay custom. Entries of goods on which a drawback is allowed, must likewise contain the name of the ship in which the goods were imported, the importer's name and the time of entry inwards. The entry being thus made, and an oath taken that the customs for those goods were paid as the law directs, you must carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant a warrant, which must be given to the surveyor, searcher, or land-waiter, further to certify the quantity of goods; after which the certificate must be brought back to the collector and comptroller, or their deputies, and oath made that the said goods are really shipped, and not to be landed again in any part of Great Britain.

ERMIN, or ERMINE. (GER. DA. and Sw. *Hermelin*. Du. *Hermyn*. Fr. *Hermine*, *Ermine*. It. *Armellina*, *Ermellino*. Sp. *Armino*. PORT. *Arminho*. Rus. *Gornostai*. Pol. *Gronostay*. LAT. *Ermineæ*.) The animal that produces this fur is the *Mustela candida* of Linnæus. It is a species of weasel, and abounds in all the cold countries, especially Russia, Norway, and Lapland. The English white stoat is of the same family. Furriers have given the

name of *ermin* to the skin of the sea-otter, the *mustela lutris*, which is also an inhabitant of the most northern countries; but for what reason they have so applied the appellation does not appear. The colour of this animal is extremely dark, and its fur is reckoned among the most valuable. It is sold principally to the Chinese.

ESSENCES. Several of the volatile or essential oils are thus called by the perfumers; such are the essences of bergamot, lemon, lavender, origanum, rosemary, spike, &c. &c.

ESSENCE, ORIENTAL, among the jewellers of Paris, denotes a certain ingredient made from the scales of the little fish called the blay, with which they contrive to imitate oriental pearls.

ESCAUN, a Dutch and Flemish silver current coin, value 6d. sterling.

ESTRICH, or ESTRIDGE, (GER. Fr. *Duvet d'autruche*. It. *Penna matta di strozzo*. Sp. *Plumazo de avestruz*. PORT. *Frouxel de abestruz*. LAT. *Struthionum plumæ molliores*.) is the fine soft down which lies immediately under the feathers of the bird called the ostrich. The finest is used as a substitute for beaver in the manufacture of hats, and the coarser or stronger sort is employed in the fabrication of a stuff, which resembles a fine woollen cloth. We usually import our estridge from the Levant, from Italy, and from other parts of the Mediterranean.

ETCHING, is a manner of engraving on copper, in which the lines, instead of being cut with a graver, are corroded in with aqua fortis. It has many advantages over engraving by cutting. In all the engravings on copper that are executed in the stroke manner, etching, and graving, are combined, the plate being generally begun by etching, and finished by the graver. Landscapes, architecture, and machinery, are the subjects that receive most assistance from the art of etching, for it is not so applicable to portraits, and historical designs. We shall first describe the various instruments and materials used in the art.

Copper-plates may be had ready prepared in most large towns; but when these cannot be had, procure a pretty thick sheet of copper, rather larger than your drawing, and let the brazier from whom you get it planish it well; then take a piece of pumice stone, and with water rub it all one way, till it becomes tolerably smooth and level; a piece of charcoal is next used with water for polishing it still farther, and removing the deep scratches made by the pumice stone, and it is then finished with a piece of charcoal of a finer grain, with a little oil.

Etching points, or needles, are pointed steel instruments, about an inch long, fixed in handles of hard wood, about six inches

in length, and of the size of a goose-quill. They should be well tempered, and very accurately fixed in the centre of the handle. They must be brought to an exactly conical point, by rubbing upon an oil-stone. Several of these points will be necessary. A parallel ruler is necessary for drawing the straight lines. Compasses are useful for striking circles, and measuring distances. Aqua fortis, or rather nitrous acid, is used for corroding the copper, or for biting in, as it is called. This must be kept in a bottle with a glass stopple, for its fumes destroy corks. A stopple made of wax, or a cork well covered with wax, will serve as a substitute. Bordering-wax for surrounding the margin of the copper-plate when the aqua fortis is pouring on, may be bought ready prepared, but it may be made as follows: Take one-third of bees' wax to two-thirds of pitch; melt them in an iron ladle, and pour them, when melted, into water lukewarm; then mould it with your hand till it is well mixed, and the water squeezed out. Form it into rolls of convenient size. Turpentine varnish is used for covering the copper-plate with, in any part where you do not wish the aqua fortis to bite. This may be diluted to a proper consistence with turpentine, and mixed with lamp-black when laid upon the plate. Etching-ground is used for covering the plate all over, previously to drawing the lines on it with the needles. It is prepared in the following manner: Take of virgin wax and asphaltum, each 20 ounces; of black pitch and Burgundy pitch, each half an ounce; melt the wax and pitch in a new earthen-ware glazed pipkin, and add to them, by degrees, the asphaltum, finely powdered. Let the whole boil till such time as, by taking a drop upon a plate, it will break when it is cold, on bending it double two or three times between the fingers. The varnish being then enough boiled, must be taken off from the fire, and, letting it cool a little, must be poured into warm water, that it may work the more easily with the hand, so as to form into balls for use. It must be observed, first, that the fire be not too violent, for fear of burning the ingredients; a slight immersing will be sufficient; secondly, that while the asphaltum is putting in, and even after it is mixed with them, the ingredients should be stirred continually with a spatula: and, thirdly, that the water, into which this composition is thrown, should be nearly of the same degree of warmth with it, to prevent a kind of cracking, which happens when the water is cold. The varnish ought always to be harder in summer than winter, and it will become so, if it be permitted to boil longer, or a greater portion of the asphaltum be used. To lay the ground for etching, proceed in the following manner:

Having cleaned the copper-plate with some fine whiting and a linen rag, to free it from all grease, fix a hand-vice to some part of it, where no work is to be done, to serve as a handle for managing it by when warm. Roll up some coarse brown paper, and light one end of it; then hold up the back of the plate over the burning paper, moving it up until ever part is heated, so as to melt the etching ground, which should be rolled up in a bit of taffeta, to prevent any dirt, that may happen to be among it, from mixing with what is melted upon the plate. If the plate be large, it will be best to heat it over a chafing-dish, with some clean coals. It must only just sufficiently be heated to melt the ground. When a proper quantity of the etching ground has been rubbed upon the plate, it must be dabbed, or beaten gently, while the plate is hot, with a small dabbler made of cotton, wrapped up in a piece of taffeta: by which operation the ground will be distributed equally over the plate. When the plate is thus uniformly and thinly covered with varnish, it must be blackened by smoking it with a wax taper. For this purpose, twist together three or four pieces of wax taper to make a larger flame, and while the plate is yet warm, hold it with the varnished side downwards, and move the smoky part of the lighted taper over its surface, till it is made almost quite black: taking care not to let the wick touch the varnish, and that the latter get no stain or smear. In laying the etching ground, great care must be taken that no particles of dust or dirt of any kind settle upon it, as those would be found very troublesome in etching; the room, therefore, in which it is laid, should be as still as possible, and free from dust. The ground being now laid, and cool, the next operation is to transfer the design to the plate. For this purpose, a tracing on oiled paper must be made, from the design to be etched, with pen and ink, having a very small quantity of ox's gall mixed with it, to make the oiled paper take it; also a piece of thin paper, of the same size, must be rubbed over with red chalk, powdered by means of some cotton. Then laying the red chalked paper, with its chalked side next the ground, on the plate, put the tracing over it, and fasten them both to the ground, by a little bit of bordering wax. When all this is prepared, take a blunt etching needle, and go gently all over the lines in the tracing; by which means the chalked paper will be pressed against the ground, and the lines of the tracing will be transferred to the ground; on taking off the papers they will be seen distinctly. The plate is now prepared for drawing through the lines which have been marked upon the ground. For this, the etching points, or needles, are employed, leaning hard, or lightly, according to the

degree of strength required in the lines. Points of different sizes, and forms, are also used for making lines of different thickness, though commonly this is effected by the biting in of aqua fortis. A margin or border of wax must now be formed all round the plate, to hold the aqua fortis when it is poured on. To do this, the bordering wax must be put into lukewarm water, to soften it, and render it easily worked by the hand. When sufficiently pliable, it must be drawn out into long rolls, and put round the edges of the plate, pressing it down firmly, and forming it with the fingers into a neat wall or margin; a spout must be formed in one corner, to pour off the aqua fortis afterwards. The spirit of nitre is now to be diluted with four or five times as much water, or more, (according as you wish the plate to be bitten quickly, or slowly,) and poured upon the plate. In a few minutes you will see minute bubbles of air filling all the lines that have been drawn on the copper, which must be removed with a feather as they appear. By the more, or less, rapid production of these bubbles, you judge of the rapidity, with which the nitre acts upon the copper. The biting in of the plate is the most uncertain part of the process, and nothing but very great experience can enable any one to tell when the plate is bitten enough, as the thickness, and depth of the line, cannot easily be seen till the ground is taken off. When you judge from the time the acid has been on, and the rapidity of the biting, that those lines, which you desire to be the faintest, are as deep as you wish, you pour off the aqua fortis by the spout, wash the plate with water, and dry it, by blowing with a bellows, or by the fire, taking care not to melt the ground. Those lines that are not intended to be bitten any deeper, must now be stopped up with turpentine varnish, mixed with a little lamp-black, and laid on with a camel's-hair pencil; and when this is thoroughly dry, the aqua fortis may be poured on again, to bite the other lines that are required to be deeper. This process of stopping out, and biting in, is to be repeated as often as there are to be lines of different degrees of thickness, taking care not to make any mistake in stopping out wrong lines. It is also necessary to be particularly careful to stop out with the varnish those parts, from which the ground may happen to have come off, by the action of the nitre, otherwise you will have parts bitten that were not intended, which is called foul biting. When the biting is quite finished, the next operation is to remove the bordering-wax and the ground, in order to see what success you have had; for till then this cannot be known exactly. To take off the bordering-wax, the plate must be heated by a piece of lighted paper, which softens

the wax in contact with the plate, and occasions it to come off quite clean. Oil of turpentine is now poured upon the ground, and the plate is rubbed with a bit of linen rag, which removes all the ground; lastly, it is cleaned off with whiting. The success of the etching may now be known, but it is necessary to get an impression taken upon paper, by a copper-plate printer. This impression is called a proof. If any parts are not bitten so deep as was intended, the process may be repeated, provided the lines are not too faintly bitten to admit of it. This second biting in, in the same lines, is called re-biting, and is done as follows: Melt a little of the etching-ground on a spare piece of copper, and dab it a little, to get some on the dabber; then having cleaned out with whiting the lines that are to be re-bitten, heat the plate gently, and dab it very lightly with the dabber. By this the parts between the lines will be covered with the ground; but the lines themselves will not be filled up, and consequently will be exposed to the action of the aqua fortis. This is a very delicate process, and must be performed with great care. The rest of the plate must now be varnished over, the bordering-wax put on again, and the biting repeated in the same manner as the first. If any part should be bitten too deep, it is more difficult to recover it, or make it fainter. This is generally done by rubbing the part down with a piece of charcoal. This will make the lines shallower, and cause them not to print so black. Should any small parts of the lines have missed altogether in the biting, they must be cut with the graver; which is also sometimes employed to cross the lines of the etching, and thus to work up a more finished effect. Dry pointing, as it is called, is also another method used for softening the harsh effects usually apparent in an etching. This is done by cutting with the etching point upon the copper, without any ground or varnish. This does not make a very deep line, and is used for covering the light, where very delicate tints and soft shadows are wanting. By varying these processes of etching, graving, and dry pointing, as is thought necessary, the plate is worked up to the full effect intended; and it is then sent to the writing engraver, to grave whatever letters may be intended to be put upon it.

Etching on glass.—Glass resists the action of all acids, except the fluoric acid. By this, however, it is corroded in the same manner as copper is by aqua fortis; and plates of glass may be engraven in the same manner as copper. There are several methods of performing this. We shall first describe the mode of etching by means of the fluoric acid in the state of gas. Having covered over the glass to be etched with a

thin coat of virgin-wax, (which is only common bees'-wax bleached white,) draw the design on it in the same manner as in etching on copper. Then take some fluur spar, commonly called Derbyshire spar, pound it fine, and put it into a leaden vessel, pouring some sulphuric acid over it. Place the glass with the etched side lowermost over this vessel, two or three inches above it. Apply a gentle heat to the leaden vessel; this will cause the acid to act upon the fluur spar, and disengage the gas, which will corrode the glass. When it is sufficiently corroded, remove the wax by oil of turpentine. This etching may be also performed by raising a margin of bordering-wax all round the glass, in the same manner as copper etching, and pouring on the liquid fluoric acid which acts upon the glass. When it is sufficiently corroded, remove the ground as before. A third method of etching on glass is as follows: Having put the wax on the glass, draw your design, and raise a margin all round it. Then put the fluur spar, with some sulphuric acid diluted with water, upon the glass. The sulphuric acid will dissolve the fluoric, which will be absorbed by the water and corrode the glass.

ETHER, or ÆTHER. When some of the acids are combined with alcohol at a certain temperature, decomposition takes place, and the product is a peculiar fluid, termed *Ether*. According as the different acids may have been employed, it is called *sulphuric, nitric, muriatic, or acetic ether*.

The ethers are light, colourless fluids, of a peculiar penetrating smell, and a strong spirituous taste. They are volatile at low temperatures. Good sulphuric ether is of specific gravity .750. They possess highly stimulating properties, as medicines.

Sulphuric ether is of considerable use in the arts: it takes up gold from its solution in aqua-regia; and is thence employed for gilding; the ether, being volatile at the common temperature of the atmosphere, leaves the gold thinly distributed over the body to which the solution has been applied. It is also used for dissolving elastic gum.

EUPHORBIIUM. (GER. *Euphorbium-gummi*. DU. DA. and LAT. *Euphorbium*. SW. *Prustkåda*. FR. *Euphorbe*. IT. and SP. *Euforbio*. PORT. *Euforbio, Alforba*.) See GUM.

EUROPE, one of the four quarters of the globe, and, though the smallest, yet is the most important in point of commercial, as well as political, consequence; being the emporium, in which all the trade of the other parts is centered.

We do not enter into an historical detail of the rise and progress of European commerce in this place, having already

treated it at sufficient length, under the article **COMMERCE**; but to develop the state of European traffic, as it exists in modern times, and exhibit the commercial relations, by which the nations that compose it are bound to each other. To accomplish this design, we shall likewise avoid all cosmographical details, and confine our observations and statements to the *Productions, Manufactures, and Commerce* of the different countries of Europe, under their respective heads.

In pursuance of this design, an alphabetical arrangement of the different kingdoms and states of Europe has been considered the best.

DENMARK.—*Copenhagen*, or, in the language of the country, *Kiøbenhavn*, is the capital, not only from being the residence of the king and the public functionaries of the government, but from being the emporium of trade, commerce, and manufactures. It is situated in the island of Zealand, the principal one of those which go to compose this kingdom, and has one of the finest harbours in the Baltic, with a depth of water sufficient for vessels of any burthen.

Productions.—Busching estimates the annual produce of the whole kingdom at 8,361,700 tons of corn, rye, barley, oats, wheat, buck-wheat, pease, vetch, and beans. In a good harvest the Danes export grain. The islands of Fionia, Laland, (which is the most fertile,) Langeland and Jutland, furnish the greatest quantities of corn. The inhabitants of Denmark have used some exertions to derive, from their native soil, wool for the manufacture of cloths and other stuffs; not that this article is scarce in Denmark, on the contrary, flocks of sheep abound here; but, with the exception of a few districts, the wools are of the coarsest description, fit at best for the manufacture of ordinary hats only. In some parts of Jutland the Danes have introduced the race of English sheep. The Danish horses are so beautiful in figure, and so strong, that they are in general preferred to all other horses for the harness. The islands of Zealand, Fionia, and Laland, furnish the best saddle-horses. Those of Jutland are larger, heavier, and have bigger heads. The horses of the duchies are very beautiful, fit for harness, larger than the Danish, but less durable. Those of the district of Anglen are reputed the best. A vast number of horned cattle are pastured in Denmark. We are assured that 100,000 oxen are annually exported, 80,000 of which are furnished by Jutland. Large flocks and herds of sheep, and pigs, are also reared here, several of which are exported to foreign countries. Hides of oxen, sheep, and calves likewise form part of the commodities of this kingdom. The herring-fishery is carried on near the island of Zealand, and might be entirely engrossed by the Danes.

Denmark has long been celebrated for its mines, and several considerable discoveries of ores have been recently made in the mineral world; besides many substances fit for dyeing, such as vitriol, alum, &c. Jutland and Zealand produce ochre, a red earth, called Danish red, besides umber, and a sort of blue earth, &c.

Manufactures.—Sugar-houses have been established in Denmark for nearly half a century; and there is a salt-petre manufactory at Copenhagen. Within five or six miles of the capital there are powder-mills, whence the navy, and army, are supplied with ammunition. The manufacture of cloth is the principal fabric in wool, and, we may add, the chief of the Danish manufactures; it is carried on at Copenhagen. Next to cloth, the most considerable woollen manufactures are camlets, calimancoes, bolting-cloths, serges, swan-skins, plush, &c. Some of these stuffs are made in the capital, and some in different parts of the kingdom. The greater part of the wool, consumed in the manufactures, is brought from Germany ready spun. There are above fifty-four fine woollen-stocking manufactories. The islands of Faro also furnish a great number of woollen stockings for the use of the soldiers and sailors. Stockings, caps, gloves, &c. are made from cotton principally in Jutland, whence they are frequently exported. There are hat manufactories at Copenhagen. The wool of Zealand is very coarse, and serves only for making a sort of stuff called *wadmel*. There are but few silk manufactories in Denmark. At Copenhagen are made painted linens, oil-cloth, calico, cambrics, and most of those articles which we call Manchester goods. Also sail-cloth, for the royal navy, as likewise ropes, &c. The manufacture of lace is chiefly carried on in the duchy of Sleswick, at Tondern; the greater part of the women at this place being employed in the making of it. A great deal of this lace is sent into Norway, Germany, and to the Baltic. There are paper-mills at Lunden, Roschild, and Ingelsholm, in Jutland. At the first is manufactured lapping paper; at the second are made two sorts of writing paper, and lapping paper; and at the third, the paper which bears the name of the place, besides a sort of blue paper, and paste-board. White, yellow, black, and gray, glazed leather gloves are made at Randers in Jutland, at Odensee in Fionia, and in the duchy of Sleswick. There are several soap-boilers in Denmark, and, in fact, there are few towns in which one, or more, are not to be found. There is a vitriol manufactory in Fredericksburgh, and another at Jagers. Delft and porcelain are made in Denmark; but very little of the former, and none of the latter, is exported. There is a manufactory of fire-arms at Elsinore, where are made muskets, pistols, and bayonets.

Commerce.—The situation of Denmark is so well adapted for commerce, as to render this kingdom a staple of the Baltic. Formerly the Hanse Towns possessed the commerce of Denmark, but the English, and the Dutch, wrested it from them. The Danes having very few colonies in America, the traffic which they carry on with that part of the world as well as with Africa, is very inconsiderable in time of peace; but when war takes place between the other maritime powers, they profit by the occasion, and drive a brisk trade to those quarters of the globe. Next to Copenhagen, the chief commercial towns of Denmark are, Usted, Christianstadt, Carlsrona, Saltzburg, Carls haven, and Elsinore. The major part of the commerce with Denmark is conducted in the way of barter. The Danish exports are, occasionally corn, at all times seeds, some dried fruits, spirits distilled from grain, beer, flour, horses, oxen, Jutland pigs, bacon, salted provisions, butter, cheese, tallow, wax, honey, mead, skins, wool, hogs' bristles, horse-hair, quills, herrings, pickled oysters and other fish; cloths, gloves, laces, cord, tin, copper, and ironware; linen-cloths, all sorts of woollen-stuffs, stockings, sheep-skins, spun-wool, sail-cloth, hats, hones, delft, brown crockery, trunks, shoes, slippers, refined sugar, syrup, &c. &c. The species of merchandise which sell well in Denmark are, salt, wines, and brandy; paper, gold, silver, silken, and woollen, stuffs; tobacco, cotton, indigo, and spices. The principal part of the trade of Denmark is under the monopolies of certain companies, as the East India, and Greenland, Companies. They had an Icelandic Company of considerable importance, but this trade is now thrown open; and an African Company, which can scarcely be said to exist since the abolition of the slave trade, in which meritorious act Denmark took a lead. They have a national bank at Copenhagen, but its paper is always at a considerable discount.

Accounts are kept here in rix-dollars, each consisting of 6 marcs, and each marc of 16 skillings Danish; but none of these monies are in general circulation; that which is used in commercial transactions being Bank money, at a discount, as has been observed.

We must not close this article without some account of Elsinore, the second place for importance in the Danish dominions, situated near the straits called "the Sound," where the Baltic and North Seas unite, and from which, though a place having no trade of its own, a great portion of the king of Denmark's revenues arise; for here every merchant-vessel passing the Sound is obliged to pay a certain duty, (differing indeed according to treaties with different companies,) this right being guaranteed by all the commercial nations

of Europe. In 1817, the following ships passed the Sound :

ENGLAND. — To this article we shall dedicate a greater number of pages than to those that have preceded ; because this head must, without doubt, prove much more interesting to the generality of the readers of this work, than any of the foregoing. With respect to the articles *productions* and *commerce*, we shall pursue our usual plan ; but, in detailing that of *manufactures*, we purpose, as well for the sake of perspicuity, as of avoiding omissions, &c. to arrange the *principal* manufacturing cities, and towns, in alphabetical order, assigning to each its proper branches of trade and manufacture, and inserting under every head such observations as shall appear necessary.

Productions. — The principal productions of the soil itself are grain, vegetables, wood, hops, hemp, flax, and the common fruits.

Grain. — England need not to envy France its vines, nor Italy its olives ; for its grain amply compensates (by supplying real necessities for the maintenance of life) for the want of those luxuries. The quantity of wheat and rye annually reaped in England and Wales has been estimated at 5,110,255 qrs., of barley 4,603,272 qrs., and of oats 4,240,947 qrs. Mr. Arthur Young's computation is as follows, viz.

Of corn and rye	9,198,585 quarters.
Barley	- 11,595,792 ditto.
Oats	- 10,285,690 ditto.

The greater part of this grain is consumed at home, and Mr. Young observes, " there is only a quantity to the value of 947,000*l.* sterling exported annually." The population of the kingdom, however, has increased so rapidly since that calculation was made, that of late years, instead of being to any degree an exporting, we have become an importing country, and that to a considerable amount. The English counties are in general fertile in corn ; the most distinguished, however, are Cambridgeshire, Hertfordshire, Dorsetshire, Gloucestershire, Oxfordshire, Cornwall, Kent, Essex, Suffolk, Northamptonshire, Berkshire, Bed-

fordshire, Lancashire, Yorkshire, Somersetshire, Buckinghamshire ; and in Wales, Cardigan, Carmarthen, Brecknock, Montgomery, and Anglesea. The greatest quantity of barley is grown in Essex, Cambridge, Bedford, Norfolk, Huntingdon, Suffolk, Surrey, Bucks, Nottingham, Oxford, and Berks. From the ports situated upon the eastern and southern coasts of England, grain is principally exported ; the chief of these ports are Berwick, Chichester, Colchester, Dover, Exeter, Harwich, Hull, Ipswich, Lynn-Regis, Milford, Newhaven, Poole, Portsmouth, Sandwich, Shoreham, Southampton, Wells in Norfolk, Yarmouth, and London. The English flour has been reckoned the best in the world, and finds its way into many foreign markets, when corn is at such a price that it is lawful to export it ; but the American flour, though different in flavour, is found to be little inferior for use.

Vegetables and Fruits. — Potatoes, it is the common opinion, were first brought from America to Ireland, and thence to England. These valuable vegetables were long cultivated chiefly in Middlesex, Hertfordshire, Nottinghamshire, Lancashire, Staffordshire, Warwickshire, Surrey, and in Carmarthenshire in Wales ; but are now the staple article of food for the poor, and the common appendage of the tables of the wealthy, in every part of the kingdom. Cabbages, artichokes, lettuces, asparagus, celery, &c. &c. are grown throughout the kingdom. Apples, pears, cherries, peaches, plums, and apricots, grow very plentifully in the greater part of it. There are entire fields of turnips, pease, and horse-beans throughout the whole of it. According to the modern course of husbandry, turnips are of the most essential importance, and, of late, cabbages have been much cultivated on a large scale, having been found with very little contrivance to be rendered one of the most productive esculents for the food of milch cows. Mangel wurzel is now also coming much into vogue for the same purpose.

Wood was formerly abundant in Great Britain, and there were many royal forests abounding in timber ; but partly from their having been inclosed, on account of the great demand for corn, and partly from other causes, the timber on these (till very recently at least) has been suffered to decline. For that which supplies our navy we are principally obliged to the forests of Germany, and to some of the northern kingdoms ; and for architectural and domestic purposes to Russia, which produces the best fir of any country in Europe. A great deal of fir is grown in Scotland, but it is not so tough, or so durable, as that from Russia and Sweden. A taste for planting has prevailed much of late years, but it has been rather for ornamental timber, than for that

which alone can be materially serviceable for the purposes of the navy, viz. oak. However, it must not be omitted that considerable discoveries have recently been made of the utility of some other kinds of wood for the internal service of ships. One species of poplar, beside its always resisting conflagration, has been found to harden with time, to be light in weight, and not to be subject to shiver or splinter, qualities beyond all estimate for some purposes. Boards of larch-wood have also been demonstrated to be even more durable than those of oak, *under water*; and the bark of the last mentioned tree to be inferior only to the oak for the purposes of tanning. See further, *title* **TIMBER**.

For vegetables, see further, *title* **ROOTS**.

For hops, hemp, flax, and saffron, those respective *titles*, and *postea*.

For fruits, *title* **CIDER**.

We now come to consider those articles which emanate from, or are supported by, the soil, though not the direct and immediate product of its surface. Such are liquors derived from grain, or from fruits; cattle depastured on its vegetable produce; and minerals extracted from its bowels.

Beer.—This, as a generic term for a staple article of consumption, and of export, has been already treated under that *title*. It ought not, however, to be entirely overlooked under the immediate subject of our observations. Under this head are comprehended all the different kinds of malt liquor brewed in England, namely, ale, porter, and table beer. Ale is brewed in almost every part of the kingdom; but that made in Staffordshire, Bedfordshire, Lincolnshire, Yorkshire, Dorsetshire, and Nottinghamshire, is the most esteemed. The ale made at Burton-upon-Trent in Staffordshire, is smooth, but heady and bitter. Dorsetshire beer is also a kind of ale, but of a lighter quality than those already mentioned. The Nottingham ale possesses a bitter flavour, and is exceedingly wholesome, as is that made at Lichfield in Staffordshire, a great deal whereof is consumed by the manufacturers and other inhabitants of the adjacent populous town of Birmingham. In, and about, London are innumerable ale breweries, some of which send out excellent ale, and others the vilest trash, which, so far from being a wholesome beverage, has in many instances proved absolute poison to its consumers. All the ales of London are made in imitation of the country ales; but seldom are equal to their originals. Porter may be divided into two classes, namely, brown-stout, and porter properly so called. The London porter has deservedly obtained the reputation of being the best in the world; it is a wholesome, cooling, and at the same time nutritive, beverage. The porter breweries in, and about, London are so numerous, that

our limits will not permit us to enter into a detail of their situations, different characters, &c. Vast quantities are annually exported from London for America, the West Indies, India, Africa, and most of the northern nations. When intended for warm climates, the porter is exposed, for several days previously to its being shipped, to the open air, in large vats, in order that it may flatten, as in the voyage it is fermented, and consequently, by the time it reaches the place of its destination, becomes so brisk, and in such high order, as to be fit for immediate use. Brown-stout is only a fuller bodied kind of porter than that which serves for ordinary drinking. A great deal of this is exported to America and the West Indies.

Porter of a quality not much inferior to that made at London, is brewed in many of the provincial towns, and that now in considerable quantities. A liquor inferior in strength, and commonly called "small beer," and sometimes "table beer," is now also to be had at almost all public breweries. So obtained it is generally vapid and spiritless, but when brewed in private families is a delicious beverage. All sorts of beer should be made from malt and hops; of late, however, it has been discovered that noxious ingredients have, in many instances, been substituted both for one, and the other, although prohibited by divers statutes.

Malt, which is grain in an incipient state of vegetation, and afterwards dried and bruised, is, as we have already stated, one of the chief ingredients used in the making of beer. It is a considerable object of English commerce. The following are the principal species of malt, with their different weights, used in the metropolis:

Best pale Kingston,	59½ lbs. per bushel.
Good ditto,	58½ lbs. ditto.
Best brn. Abingdon,	56½ lbs. ditto.
Indifferent ditto,	54 lbs. ditto.
Best brown Norfolk,	54½ lbs. ditto.
Best ditto Hertford,	55½ lbs. ditto.

A prodigious quantity is now manufactured in the middle of the kingdom, especially in the county of Nottingham. More than 50 millions of bushels are annually consumed for breweries and distilleries.

Hops.—The culture of hops occupies large tracts of land in the counties of Kent and Surrey, where the best sort is grown; Worcestershire also yields large quantities, but of a quality inferior to the first mentioned. The counties of Nottingham, Essex, and Sussex, also boast some plantations, as do several parts of Wales. Some writers assert, that the best hops in England are grown near the town of Farnham in Surrey, but others give the preference to those grown in Kent. The duties laid upon malt and hops are very considerable, and yield the crown a large revenue.

Cider.—If any thing can compensate for the almost total defect of wine in England, it is the cider. The English cider is most certainly the best in Europe, notwithstanding the French tell us that the ciders of Brittany, and Normandy, are far superior to ours. The Herefordshire cider is generally reckoned the best, though many give the preference to the Devonshire. The inhabitants of Worcestershire, Gloucestershire, and Somersetshire, make very good cider, and in large quantities: exclusive of what they themselves consume, these counties annually send to London about 30,000 hogsheads of cider. The counties of Kent, Oxford, and Glamorgan in Wales, produce very excellent cider; the latter county is termed, very justly, the garden of Wales.—*Perry* is made to such perfection, that it is not unfrequently sold as Champaign. Perry is in general the produce also of the cider counties, and with it is exported to Ireland, the West Indies, &c.

Wines.—Wines for home consumption (for they are not of sufficiently exquisite flavour to have become an article of export) are made in considerable quantities from currants, gooseberries, and other fruits; are an object of considerable duties when sold, and raise a revenue of some importance.

Spirituuous Liquors.—There are numberless distilleries in, and about, London, and most of the large towns and cities, in which are made spirituuous liquors, principally from grain, in imitation of Hollands, geneva, rum, and brandy; all these are, in quality and flavour, inferior to the genuine spirits, and some of them, particularly the geneva, are oftentimes adulterated by mixtures, such as vitriol, turpentine, &c. There is a neutral spirit made by the London distillers, which, by a mixture of water, they reduce to any degree of strength that suits their purpose. The price of malt spirits varies from about 9s. to 13s. per gallon.

Hemp and Flax are chiefly cultivated in the following places; near Dover and Maidstone in Kent; in some parts of Middlesex; the neighbourhood of Ely, Taunton, and Exeter; in Lincolnshire; in Somersetshire; and Suffolk. On the whole, hemp and flax are not very conspicuous in the list of English productions.

Wax and Honey are found in abundance throughout the country, and form a branch of internal commerce. The cakes of wax for the manufacture of candles are obliged to be stamped with the bleacher's name, to prevent fraud in mixing tallow, or turpentine, with the wax.

Beasts.—The rearing of cattle, their uncommon abundance in England, and the dedication of large tracts of land to their use, are as ancient as the Britons and the Picts. The number pastured in England ought, indeed, to be considerable; for it is

well known, that the English consume more meat, and less bread, than any other European nation. Mr. Arthur Young, in his journey to the north of England, estimated the value of beasts at 36,480,000l. All the counties of England furnish oxen; but Lancashire, Somersetshire, and Buckinghamshire, produce vast herds of excellent quality; the oxen of Lincolnshire, of Romney-marsh in Kent, of Somersetshire, Huntingdonshire, Suffolk, Herefordshire, Salop, Leicestershire, Northamptonshire, and Dorsetshire, are not only numerous, but of a remarkably large size. The Welsh cattle are in general so small that they have obtained the appellation of *runt*, a name of contempt. Oxen are generally considered to have attained their full growth, and consequently to be fit for slaughtering, when they arrive at the age of four or five years. It is very common in some of the counties, particularly in Somersetshire, to employ oxen for the purposes of agriculture till they are three or four years old, after which they are fed to the age of seven, and then slaughtered. Markets are held once, or twice, a week for the sale of cattle in every city, and almost every town in England. The kine of England are not less remarkable for their size and beauty, than for the quantity of rich milk which they yield, and from which are made excellent butter and cheese. England has always reared large flocks of sheep, which have in a very great degree contributed to the welfare of the country. The flat country between East Bourn in Sussex, and Chichester and Portsdown in Hampshire, is entirely covered with sheep: in Romney-marsh there is an extent of 47,110 acres entirely devoted to feeding them: it is computed that upon this tract (allowing three sheep to an acre) 141,330 sheep are fed exclusive of lambs. The number of beasts which pass into Salisbury Plain almost exceeds calculation. The highlands of Coteswold, and the neighbouring plains in Gloucester, Worcester, and Oxford, also abound in sheep. The county of Surrey has its share also; but Lincolnshire and Leicestershire, till very lately, divided the celebrity of the kingdom for wool between them; the former for the large heavy sheep with long coarse wool, adapted to the manufacture of carpets, baizes, &c., the latter to that of cloths for apparel. We must not pass over in silence the sweet-flavoured, but small, sheep of the Welsh mountains, nor the fine wool of those bred in the environs of Leominster in Herefordshire. Some mention should also be made of the flocks fed in the wolds of the East Riding of Yorkshire, and the county of Durham; here are found sheep nearly as large as the Leicestershire breed. These animals have so multiplied in Northumberland and Cumberland, that the inhabitants are obliged annually to

send away great numbers of them; nevertheless it is only forty years since the people of these shires began seriously to attend to the breeding of sheep. On the downs situated towards the middle of Wiltshire, are pastured more sheep than in any other part of England. Within a few years past, the Merino breed of sheep from Spain has been introduced into this country; they will tend to improve considerably the quality of our wools, and, it is said, are of so hardy a nature, that they will thrive even in the Shetland Isles. However, an opinion prevails that their wool is deteriorated, after a generation or two, in this climate, but that by crossing the breed with that of our fine-woolled down sheep, all the benefit we can wish is obtained in point of fleece, and the qualities of our own sheep communicated to the produce of the connection.

Wool has long been considered the staple commodity of our island, and has been viewed with the most jealous attention by great individuals, as well as by the legislature. Hence the exportation of sheep themselves, as well as of their fleeces, have been prohibited by divers statutes, especially by 28 Geo. 3. c. 58. under severe penalties.

Cheese is made in smaller or greater quantities, in all the counties of England. That of Gloucestershire is accounted the best, and is certainly one of the dearest; the finest sort is that called Berkeley hundred. The Worcestershire is similar to that made in Gloucestershire. The Gloucester is distinguished into single, double, and treble, according to its thickness. The Stourbridge is the most celebrated of the cheeses of Worcestershire. The Cheshire is, without doubt, the wholesomest, and the most used of any kind of cheese; and some think that, in respect to flavour and quality, it is by no means inferior, but rather superior, to that of Gloucestershire: about 30,000 tons are annually sent from Cheshire to London, and large quantities to Bristol, York, Scotland, Ireland, &c. A very rich kind, under the name of Stilton cheese, is made in Leicestershire; and an excellent mild cheese is made in Derbyshire and Nottinghamshire. The Warwickshire is very good; great quantities of it are consumed in the large town of Birmingham, and about 19,000 tons are annually sent to London. At Cheddar in Somersetshire, very large ones are made, which come near, in flavour and quality, to Parmesan cheese. All the milk of Somersetshire is used for the making of cheeses. The Banbury cheese of Oxfordshire is very good. The Wiltshire is rich, and much esteemed. The Suffolk is proverbially the worst in England.

Butter. — Butter of very good quality is made in Suffolk; and a fair for the sale of this article is established at Ipswich. The city of York carries on a large traffic in

it. The Cambridge butter is excellent, and forms a valuable branch of Cambridge-shire commerce. Epping, in Essex, furnishes London with great quantities, and is said to be the best made in the kingdom. Cambridge, Suffolk, and York, annually supply London with about 60,000 firkins, and Epping supplies about one-fourth as much.

Pigs are reared in almost every shire. The English pork is very fine, and by far more delicate than that of any other country. The hams of Yorkshire, Wiltshire, &c. and their bacon, are exquisitely flavoured, and the former, as well as the sides of the latter, are of an extraordinary size. Very large quantities of hams, and bacon, are exported to the West Indies, beside which they form a considerable branch of internal commerce.

Goats are reared in all the mountainous parts of England; but Wales abounds in these useful animals. The breed of English and Welsh goats is large, and their skins afford a considerable revenue to their owners: their milk also yields a profit.

Horses. — England abounds in these excellent, noble, and useful animals: they are of every description. The best horses are the Lincolnshire, Northamptonshire, Leicestershire, and Yorkshire. The Welsh are small, but active. The rich pastures, and the extraordinary care that is taken of the colts, as well as the excellence of the various breeds, combine to enhance the value of the horses of England. Those who rear them take uncommon pains to improve the breed, by procuring foreign stallions of the most esteemed species, such as those of Barbary, Turkey, Denmark, Flanders, and Naples. To this attention on the part of the breeders, may be attributed the swiftness and beauty of the English geldings. Buffon says, that in respect to figure, the English horses nearly approach those of Arabia and Barbary, from which, in fact, they derive their origin; nevertheless, the heads of the former are rather larger than those of the latter, but they are well-shaped, though the ears are somewhat longer. By the ears alone, one might discover with ease the difference between a horse of Arabia or Barbary, and one of England; but the grand point of distinction between those species, lies in their height and size. The English horses are in general better filled than the others, and are commonly about 4 feet 10 inches, and not unfrequently 5 feet in height. They are of various colours, and for strength, beauty, activity, and capability of undergoing fatigue, are not to be excelled by any horses in the world. Their beauty and excellence strike every foreigner in passing through the kingdom. The number of races established in various parts of the kingdom may be assigned as so many causes for the high perfection to which the breed has been

brought. Newmarket possesses the first race-course in England, and the most celebrated in the world: hither are brought race-horses, which, for figure and beauty, might serve as models to a sculptor or painter, who wished to give an animated description of the horses of the sun. There are excellent race-courses at Doncaster in Yorkshire, Newcastle-upon-Tyne, Chester, Lichfield, Lewes, Epping, Brighton, York, Derby, &c. &c. The breed of English cart and carriage horses is very fine; to form a just idea of the stateliness, and muscular strength, of these animals, they must be seen in harness. There are numberless horse-fairs throughout the kingdom, which our limits will not permit us to enumerate. The exportation of horses for foreign parts is not prohibited, and is very considerable.

Mules and Asses are very abundant in England, and are in general larger than those of other countries, Spain and Portugal excepted. They are chiefly used by the poorer classes of inhabitants, but of late years the watering places have given the *Donkies* a preference to horses for the purpose of riding; for invalids their milk is recommended in consumptive cases.

Fowl. — The tame fowl of England are turkies, geese, ducks, &c. In Norfolk, turkies are reared to a larger size than any where else, and sent in immense flocks to the London market. Geese are bred in almost every county, and great numbers of them sent to London, particularly about Christmas. The chickens of England, though well-flavoured, are inferior in point of delicacy to those of Ireland, which in their turn are not to be compared to those of France. The wild fowl of England consist chiefly of moor-game, wild ducks, larks, partridges, pheasants, plovers, quails, snipes, teal, widgeons, woodcocks, and wheat-ears. The wheat-ear is delicious; it is about the size of a lark, and is only found in Sussex, particularly in the neighbourhood of Brighton. In enumerating game, we should not forget to name the beasts, as well as birds, which come under that denomination. The deer of the English parks, which were originally a foreign breed, are superior in beauty of skin, and delicacy of flesh, to those of most countries. The hares, rabbits, &c. are also numerous, and truly excellent in their kind.

Fish. — The situation of England secures, in the article of fish, an important source of riches: it forms a considerable branch of internal, as well as external, commerce. No country on the face of the globe is better situated for carrying on fisheries than Great Britain. The Whale fishery is more within its power than that of any nation, and at all seasons of the year the English enjoy the profits arising from some, or other, of their fisheries. The Greenland fishery, although of late there has been a considerable increase of the shipping sent

hither, especially from Hull, does not seem to be completely naturalized. Dr. Franklin, by a bold, but expressive figure of speech, termed the fisheries the "agriculture of the ocean," and certain it is, that they have been a greater source of wealth to some countries than the produce of their land. We shall have occasion to treat of the public fisheries more particularly hereafter under that title, and therefore at present it is unnecessary to say more on the subject.

Cod. — The general name of white fish is given to all kinds of cod, such as haddock, &c. The cod fish used in England is brought from the northern coasts of the island, from the eastern coasts of Scotland, from those of New England in America, or from the banks of Newfoundland.

Haddocks are very common. The large shoal of haddocks makes its appearance periodically on the coast of Yorkshire.

Herrings. — The large shoals of herrings proceeding towards the British coasts, first make their appearance in the latitude of Shetland in April, and May; but these are only, what has frequently and justly been called, the *advanced guard* of the immense multitudes that follow in June. The latter separate at Shetland into two wings, one of which proceeds along the eastern coast of Great Britain to the English channel, the other directs its course to the westward, first visiting the Hebrides, whence they pursue their way to the north of Ireland: here they must again separate; one division enriches the coasts of the Irish sea, the other is soon lost in the immensity of the Atlantic ocean. In 1750, a British herring-fishery was erected, and since that period premiums have been granted by parliament for its encouragement. Of late years, the herring-fishery of the Frith of Forth has become very important and productive, and large quantities are thence exported, chiefly to the West Indies. They are likewise known in Germany by the name of Scotch herrings, but have not been much approved of, though preferable to those of Yarmouth, Cardigan, &c. for exportation. As during the last war the Dutch fishermen were not permitted to visit the British coasts, the English herring-fishery has gained, both in respect to quantity, and quality, but still far from having attained the excellence of the Dutch method of curing the fish. The English herring-fishery is very ancient, and a charter of Edward I. dated 1306, makes mention of its being established at Great and Little Yarmouth. Our great stations for this fishery are off the Shetland and Western isles, and off the coast of Norfolk. There are two seasons for herring fishing; the first from June to the end of August, and the second in autumn.

Lobsters — are taken in abundance in the British channel, on the coasts of Norfolk,

whence they are brought to London for sale; they are also found in great plenty on the coast of Yorkshire, and the east coast of Scotland.

Mackarel — is a summer fish of passage, found in large shoals upon the English coasts. The fishing is usually in the months of April, May, June, and July. The mackarel enter the English channel in April, and proceed up the straits of Dover, as the summer advances, so that by June they are on the coasts of Cornwall and Sussex, where the fishery is most considerable. They are excellent food when fresh, and constitute an article of commerce when well prepared, pickled, and put up in barrels. Cornwall cures the largest quantity of mackarel of any part of England.

Oysters. — This fishery is principally carried on at Colchester, in Essex; Feversham and Milton, in Kent; the Isle of Wight; the Swales of the Medway; and Tenby, on the coast of Wales. From Feversham and the adjacent parts, the Dutch have sometimes loaded a hundred large hoys with oysters, in a year. This fish is also taken in large quantities near Portsmouth, and in all the creeks and rivers between Southampton, and Chichester, and vast numbers are carried round by sea to London and Colchester, to be fed in the pits about Wavenhoe, &c. The oyster season is from the beginning of August to the end of winter. The English oysters were held in high esteem by the Romans.

Pilchards. — This fish at first sight might be easily mistaken for a herring. The chief pilchard fisheries are along the coasts of Cornwall and Devonshire. The English method of catching varies from that of other countries; on our coasts, there are persons posted ashore, who spying the colour of the water where the shoals are, make signs to the boats to go among them and cast their nets. Pilchards, when salted and barrelled, form an article of export. The chief ports whence they are shipped are Falmouth, Fowey, Saint Ives, and Penzance.

Salmon. — In no part of the world is this fish found in greater abundance, and perfection, than in Great Britain. The principal salmon fishery was formerly at Newcastle-upon-Tyne, but has latterly considerably declined. Berwick-upon-Tweed, and Dundee and Perth upon the Tay, seem to have possession of the market; this fish is likewise found in most of the rivers in England, particularly the Trent, the Severn, the Thames, and the river Ribble; its greatest weight is from 70 to 80 pounds. In Wales they smoke salmon, but theirs is far inferior in flavour to the smoked salmon of the Elbe. The English export them pickled to Venice and Leghorn. They are commonly taken in weirs, or with nets, but they are also caught by means of a spear, which the fisherman darts into the fish when he sees it

swimming near the surface of the water; it is customary, likewise, to catch them at night, by means of lights attached to the stem or stern of the boat. The season for salmon is from March to September. Smelts are caught in abundance at high-tide during the summer and autumn months, about Limehouse and Poplar.

Turbots. — Turbots are plentiful, and of all sizes, from that of a flounder, to 30 lbs. They are taken chiefly off the north coast of England, and form a considerable, and profitable, branch of internal commerce.

Besides the salt-water fish already treated of, there are many other sorts caught on the different coasts of England: at Exeter, soles of an amazing size, and exquisite flavour, are taken, the greater part whereof is sent to the city of Bath, also the fish called John Dory. The plaice, commonly called Dutch plaice, are caught upon the coasts of Kent, Sussex, and Essex, as are vast quantities of whittings. Flounders are taken at the Nore, and in the Thames even above London Bridge.

The rivers of England abound in all sorts of fresh-water fish, but particularly in salmon, barbel, bleak, carp, pike, trout, gudgeon, tench, smelts, bream, chub, dace, pope, roach, and umber or grayling. Most of the rivers abound in eels, as indeed do many of the small streams.

The laws in regard to fishing are numerous and strict, and will be found in another part of our work, under the head of FISHERY.

Mines and Minerals. — England has been distinguished for its mines since the time of the Romans, one of whose writers bestows upon it the designation of *metallorum fluens rivis*, but it does not appear that the Britons turned their attention to their mineral treasures till the reign of Henry VI. since which period, they have gradually made valuable discoveries in this respect.

England possesses neither gold nor silver mines, at least none that we know of; but the lead and other mines yield small quantities of these metals.

Iron. — The most considerable iron mines are those of Cumberland, Staffordshire, Hampshire, Warwickshire, Derbyshire, Sussex, Cheshire, and Westmoreland. The steel made in England is much esteemed on account of the fineness of its grain; it is manufactured in many counties, but particularly in Gloucestershire, Warwickshire, Yorkshire, and Northumberland. There are considerable iron mines, and steel works, at Colebrook Dale, in Shropshire; at this place has been cast and erected in the Dale, an iron bridge over the river Severn, made from the produce of the mine; from the example of which, many others have been recently erected in other parts of the kingdom.

Lead. — England has many mines of this metal: the principal ones are situated in Cumberland, in the Peak of Derbyshire, in the S. W. part of Northumberland, Devonshire, Yorkshire, Durham, Mendip Hills in Somersetshire, and in Westmoreland; also in Cardigan, Carmarthen, Flint, and Montgomery, in Wales. The mines of the Peak are very rich; those of Keswick, in Cumberland, also produce a great deal of ore. There are a few lead mines of some value in Cornwall. The lead of Carmarthen-shire is excellent: the lead ore of Devonshire, and of some mines in Wales, yields nearly 30 ounces of silver per ton. That drawn from the mines situate near Holywell, in Flintshire, does not yield above 18 ounces, and there are some mines of lead which do not yield above 4 ounces, whilst from others are drawn nearly 14 grains per lb. The mountains of Cardiganshire are so rich in lead mines, which yield a large quantity of silver, that they are called *Welch Potosi*, or the Welch Potosi; the lead drawn from these mines generally yields 72 oz. of silver. There is a lead company established in London, but it is not endowed with exclusive privileges. At Barrowdale, in Cumberland, there is a black-lead mine, which metal is almost peculiar to this county; it has been since found in the neighbourhood of Ayr in Scotland.

Pewter. — The greater part of this metal which is used throughout Europe, is the produce of England: it is formed with antimony and tin; hence the county producing tin gives us the best pewter.

Tin. — Cornwall is decidedly in possession of the best tin mines of England; the produce of these mines has made the fortunes of thousands of persons, and the working of them gives daily employment and bread to numerous families.

Copper. — Great Britain is not equally rich in copper, as in lead and tin, nevertheless it possesses many mines of the former metal; such are those of Yorkshire, Cornwall, Derbyshire, Staffordshire, Devonshire, and Somersetshire. Copper is also found in Carmarthen, and Cardigan, in Wales, and in the Isle of Man. The copper mines situated in the Quantox hills of Somersetshire, are reckoned the richest in England; two pounds of the ore yield rather more than one pound of metal. There is a company established in London, called "The English Copper Company," but its privileges are not exclusive.

Coal. — Coal mines are spread throughout the kingdom, and nature in the formation of them appears to have specially provided for the astonishing progress, the rapid strides, which British manufactures in general, were to make through the means of this invaluable mineral: most of the mines are apparently inexhaustible. The places which possess the richest coal mines are, Northumberland,

which furnishes an amazing quantity to London, &c. by way of Newcastle, whence they are carried down to Shields, which is the rendezvous of the colliers; Cumberland, which exports coal for Ireland by way of Whitehaven; this trade gives employment to more than 200 vessels: to these we may add Derbyshire, Durham, Yorkshire, and Staffordshire. The coal of the latter is taken from the pits in immense blocks, and supplies the large town of Birmingham with all the coal consumed in its numerous hardware manufactories; beside which, a large quantity of it is now sent to London by canals. Lancashire may truly be said to abound in coal; in the neighbourhood of Wigan, in this county, is found that excellent species of coal called Cannel, with which it not only furnishes most of the towns in that county, but also, through the medium of the port of Liverpool, sends vast quantities to Ireland. In Wales, the counties of Carmarthen and Pembroke possess famous coal mines, with the produce whereof they furnish Devonshire, and some other English shires. By means of the port of Swansea, in Glamorganshire, Wales also supplies the southern coast of England, and many parts of Ireland. This trade employs 1500 vessels of about 200 tons burthen each. The distribution of coal into the interior of England, is effected by means of navigable rivers and canals. Newcastle, Sunderland, and other places in the north, convey their coal to all the ports from Newcastle to London, and even to Portsmouth; from these ports it is sent into the interior, as for example, from Lynn it is sent to the Isle of Ely, to Lincoln, Bedford, Cambridge, and Norfolk. Colchester and Hardwick supply Essex and Suffolk: London sends coals to the other parts of Middlesex, to Hertfordshire, Bucks, Berkshire, Hampshire, and Surrey. The counties of Kent and Sussex receive coals through the medium of the rivers Medway and Stow. The coal of England is without doubt more various in its kinds, and better than that of any other nation, and the mines give bread to thousands, who are amply paid for the fatigues which they undergo, and the risks to which they are exposed when at work. The prices of coals are enormous in London, and many other parts of the kingdom, but in the neighbourhood of the collieries, they are sold at a very low rate; thus at Birmingham, although the demand is so great for that article, coals are sold, when of the best or larger kind, about 12s. and the inferior sort at 7s. and even 6s. per ton, of 24 cwt.

Copperas and Alum. — Green vitriol is an article of considerable internal, and external, commerce: it is made in several parts of England, but the most considerable manufacture of this article is carried on at Dept-

ford, in Kent. The copperas is made from a fire-stone found chiefly in Essex, and Hampshire, and which is called *gold-stone*, on account of its colour. The alum mines are situated in Yorkshire and Lancashire, and the mineral is found in small masses of a blueish colour, like slate. These masses contain much sulphur, and are accounted a kind of fire-stone from which vitriol may be also extracted.

Fuller's Earth — is a very valuable article for many purposes; it is a sort of marle, and serves for the preparation of stuffs; chiefly found near Ryegate, in Surrey; Maidstone, in Kent; Woburn, in Bedfordshire; Brickhill, in Staffordshire; in the Isle of Sky, in Scotland, &c.

Pipe Clay. — The glazed earth fit for making tobacco pipes, is found in the greatest perfection in Northamptonshire, near Poole in Dorsetshire, and at the Isle of Wight: it is sold at London for 20s. per ton: its exportation is prohibited.

In England is found a vast number of fossils worthy the attention of naturalists. Somersetshire, Kent, Sussex, Derbyshire, and Wales, possess marble quarries; Rutlandshire and Nottinghamshire are rich in alabaster; at the rock of St. Vincent, near Bristol, crystal is found; and amianthus in the Isle of Anglesea, &c. &c.

Salt. — The English obtain salt from sea water, salt springs, and mines of fossil salt. The frequent rains, and the feebleness of the sun's rays, do not admit of a great deal of salt being procured by means of evaporation. Many salt-pans are established upon the southern, and some upon the northern, coasts of the island, from which material advantage is derived. The principal salt-pans are at Lymington, Portsea, and the Isle of Wight, in Hampshire: Poole in Dorsetshire, on the southern coast of Devonshire, South Shields in the county of Durham, Blyth and Hartley in the county of Northumberland. The springs which produce salt, are, for the most part, situated in Durham, and Cumberland. South Shields, and some other parts of the county of Durham, together with some towns in Northumberland, and Yorkshire, carry on a considerable commerce by means of their salt-works. It is computed that there are no less than 208 salt-works in the three last mentioned counties; each of these produces from 11 to 1200 tons of salt per annum. A great deal is sent by sea to London, where it is known under the name of Newcastle salt; quantities are also exported from Newcastle to Denmark, Norway, and other states of the North. The counties of Stafford, Worcester, Lancaster, and Cheshire, also possess considerable salt-works: the principal are those of Droitwich in Worcestershire, Barton in Lancashire, and Middlewich, and Namptwich, in

Cheshire. In Cheshire many saline fountains, or salt springs, are to be met with, which yield large quantities of excellent salt. These springs, generally yield for every pound of water six ounces of salt. There are likewise some saline springs in Somersetshire, Cumberland, and Westmoreland. The richest salt mines are found in the environs of Northwich in Cheshire, from which immense quantities of rock-salt are raised; and much of it, in its crude state, is conveyed to Liverpool to be exported. Rock-salt is found in solid masses in many parts of Lancashire, whence it is sent to Devonshire, where it is broken up, and boiled in salt water: from this process results a sort of salt which is much stronger and more pungent than ordinary salt, and it is therefore termed *salt upon salt*. The salterns employed in this purpose are situated at Biddeford, Ilfracomb, Barnstaple, and other towns upon the coast of Devon, where the inhabitants make use of the salt for curing herrings, as do those of Dartmouth, Weymouth, Colchester, &c. To the salt-works already enumerated may be added those of Lowmarsh, in Carmarthenshire, and Holyhead, in the Isle of Anglesea, as also those of Colchester, Manningtree, Ipswich, Woodbridge, Southwold, &c. For the laws, &c. relating to this production, we must refer to the article SALT.

There is nothing, by which Great Britain is distinguished over all the countries of Europe, more than by the facilities afforded to loco-motion, and to the conveyance of all kinds of articles of agriculture, manufacture, and commerce, by land and by water. In inland navigation, by rivers and canals, it is now inferior but to few countries; but in public roads, with the accommodations attached to them, it is superior to all. It appears, by a return recently made to parliament, that the roads made by the authority of special statutes, and supported by the contributions of those who travel over them, in England and Wales only, exclusive of Scotland, extend over 19,755 miles; and that the other highways within the same limits, supported by parochial impost, are about 95,104 miles.

Manufactures. — The English nation possesses the virtue of public spirit in a supereminent degree, and gives a sort of liberal and philanthropical encouragement to every species of industry. In proof of the truth of this assertion, we need only mention the "Society for the Encouragement of Arts, Manufactures, and Commerce," established at London. The members of this society furnish an annual contribution, out of which is formed a fund for the purpose of granting prizes and premiums to such artists, handicraftsmen, and agriculturists, as produce useful machines tending to improve the state of manufactures, arts, and commerce. No

wonder, then, that manufactures of every description flourish in England; that they have been brought to the highest pitch of perfection; that their extent, grandeur, and national utility, have excited the astonishment of all neighbouring nations.

General View of the Manufactures. — The manufactures which have made the greatest progress are woollen stuffs of all sorts, carpets, leather of every description, hardware, hats, glass, crystal, hosiery, vegetable and mineral acids, mathematical and optical instruments, carriages of every kind, pottery, china, printing, paper, types, sculpture, vases, silken stuffs, dyeing, &c. &c. To these may be added, cotton goods of every kind: the woollen manufactures are, without doubt, the most important; and, whether we regard their variety or extent, are far superior to those of any other nation. The principal inhabitants of all the countries of Europe make use of our cloths, as do the people of Asia, Africa, and America; thus are English woollens carried to, and disseminated throughout, all parts of the globe. The woollen goods manufactured in Great Britain, consist of cloths of every description in regard to quality, size, and colour; serges, kerseys, baizes, perpetuanas, frizes, swans-downs, flannels, blankets, stockings, &c. &c. To these we may add, carpets, whose beauty equals that of the Persian or Turkish. The tan-yards of England are numerous, and the commerce carried on in hides, and leather in general, extensive beyond description. A great deal of calf-skins are exported, which bear a good reputation; as do the coney, hares', foxes', squirrels', and other skins. A vast quantity of rabbits' and hares' wool is employed in the manufacture of hats. There are in many parts of the kingdom, manufactories of morocco, and other leathers for shoemakers' use, which of late years have been brought to a great degree of perfection. The hardware manufactures have been carried to the highest pitch of elegance and excellence; they consist of every thing made from iron, brass, steel, copper, &c. such as cutlery of all sorts, from a lancet to a hanger or broad-sword, kitchen-ware, warming-pans, fenders, fire-irons, stove-grates, pistols, muskets, cannons, clock and watch movements, wire of every description, nails, pins, needles, &c. &c. The hatting business is one of the most profitable and useful in England; the English hats are the best, neatest, and most durable, of any in the world; they are lighter, and more elegantly shaped than those of France. The hats made from the fur of animals, consists of castors or beaver hats, the bodies whereof are composed of a mixture of hair, coney wool, hares' wool, and finally beaver intermixed with a small portion of floss silk; plated hats, which are only thinly covered with beaver; cordies, a sort of coarse hats

chiefly used by farmers and the middling classes; and felts, the coarsest of wool hats, which are only worn by the lower orders, or packed in puncheons and exported to the West Indies for the use of the negroes. These hats are all of various colours, but the most prevailing are black. Women's and children's beaver and woollen hats or bonnets are of all colours, but principally of black, drab, white, green, purple, blue, brown, (called Devonshire browns,) and fawn colour. There are many other kinds of hats made, such as silken hats of every description and colour, for the manufacture of which, patents have been obtained by London manufacturers; these hats are water-proof, and for a time appear very beautiful, but stiff and heavy; great quantities are exported to America, as well as to different parts of Europe. There are glass-houses all over the kingdom. The English plate glass is excellent, as is the common window glass, &c. All sorts of glass ornaments, table utensils, lustres, &c. are now cut in England in a superior manner to those of France; and are exported to India, and most parts of the world; indeed, it is almost impossible to conceive that any glass can, either in point of quality, or external beauty, excel that which is daily exhibited in the shops of London; the bottles, phials, &c. are likewise capital in their kinds. Woollen, thread, cotton, and silken hosiery, forms a considerable branch of our manufactures, and the stockings of England are universally esteemed: large quantities are exported to America.

The manufactures of vitriol, &c. are numerous, being of great use in the hardware and other businesses.

Carriages of every description form one of the most considerable branches of English manufactures. Coaches, curricles, chaises, &c. are not only made for home use, but also for exportation.

The soil of England is peculiarly adapted for the fabric of pottery and porcelain. English china has of late years been brought to such great perfection, as not only to excel the French fabric, but even to rival, and, in some respects, excel, the original from whence it derives its name. Printing is carried on with the greatest neatness and elegance; the English printing far surpasses that of many other, indeed we may say, of every other nation; and it is a well-known fact that, for several years past, and even at the present day, English pressmen are employed upon the first works in Paris, and receive better wages than the natives of France themselves. Paper of all sorts, from thick and coarse brown, to the finest writing paper, is made in several of the large towns and cities, and carried to a pitch of perfection hitherto unexampled. Sculpture every day gains ground, and the beauty of several

of our artists' productions is hardly out-done by the best works of the Italian school. Silks, such as velvets, tabbies, sarsnets, ribbons, laces, taffetas, &c. are made in many parts of England, and are by no means inferior to the Italian fabric either in regard to durability or beauty. The manufactures of cotton goods may be said to be one of the chief sources of English wealth and prosperity. The principal articles in this line are, calicoes, dimities, counterpanes, furniture for rooms, hangings, &c. &c. There are, moreover, sundry other manufactures throughout the kingdom, of inferior note. We present the reader with an alphabetical list of the *chief* manufacturing cities, towns, &c. of England, making some mention of the commerce, and other points connected with trade in the *principal* places of this great commercial nation.

Abingdon. — Here one of the most considerable markets in grain, in England, is held, and much business is done in the malt-ing line.

Alton. — Here are several manufactures of druggets and serges, white yarn, and a variety of worsted articles dyed in the wool of peculiar quality. In the neighbourhood are many hop plantations.

Altringham. — Manufactories of yarn, worsted and cotton. This place supplies Manchester with fruit and vegetables.

Andover — carries on considerable traffic in shalloons, malting, &c. particularly since the canal hence through Ramsey to Southampton has been cut. Four miles off is held the annual fair of Weyhill, being the largest in England for cattle, sheep, hops, cheese, &c. and lasts fourteen days from the 10th of October.

Arundel (Sussex). — Immense quantities of timber for dock-yards are shipped here, and the town has a manufactory of hop-bagging.

Ashbourn — has a considerable trade in cheese, sent by the river navigation.

Ashburton. — This is one of the four stannary towns of Devon, and has several good tin and copper mines in the neighbourhood, which are very productive; it has also a manufactory for serge.

Atherstone. — Here is a manufactory of hats made of common wool for the West Indies; ribbons, and shalloons.

Austle, Saint. — In the environs are several tin mines, and quarries of porcelain clay, which is sent to Liverpool, Bristol, and Staffordshire, for the potteries. The manufactures are principally of woollen cloth.

Arminster. — Here is a considerable manufactory for broad and narrow cloth, but more particularly for carpets; also for cotton tapes, druggets, leather breeches, and gloves.

Aylesbury. — Many people here derive their support from their peculiar manner of

feeding ducks: they prevent these birds from laying till October or November, when, by heating or stimulating their food, they make them drop their eggs; these are put under different hens, which are often continued on the nest for two or three broods, till the bird is sometimes exhausted, and dies. When the ducks are hatched, they are placed with great care near the fire, by which method they are reared, and often sold in the metropolis for 15s. or a guinea a couple. Lace-making is carried on here to a great extent.

Bakewell. — Coals here are plentiful, and of good quality. There are several quarries of stone, and lead and zinc mines in the neighbourhood; here is also established a large cotton manufactory.

Bampton in the Bush. — This town has a great trade for leather jackets, gloves, and breeches; and its market on Wednesday is noted for fellmongers' ware.

Barnsley, Black. — A number of forges are continually at work here in the manufacture of wire, nails, hardware, &c. Here are also manufactures of linen, cloth and check, and one for glass bottles. Coals are in great plenty.

Barnstaple was formerly possessed of a haven which, by neglect, became so shallow, that much of the trade was removed to Biddeford: now, however, it is somewhat advancing, and several merchants are established here. The markets are large for cattle, corn, and all kinds of provisions, and it has several woollen manufactories for tammies, shalloons, baize, &c. as likewise fabrics of silk stockings, and waistcoat pieces.

Basingstoke. — About 365 persons are employed in this town, principally in the manufacture of druggets, shalloons, &c. The navigable canal hence to the river Wye has opened a connection with London, very beneficial to the town and its neighbourhood.

Battel. — There are several gunpowder mills in the neighbourhood of this town, which have long been famous for the best gunpowder in Europe.

Bedford. — This town has a good trade in corn by way of Lynn. The soil of the neighbourhood is particularly productive of good wheat and barley, the first of which goes chiefly by land carriage to Kitchen and Hertford, where it is bought, ground into meal, and carried to London. About 500 women are employed here in the manufacture of lace.

Berkeley — is noted for its excellent cheese, denominated *Berkeley-hundred*. The trade is considerable here in timber, coal, malt, and cheese.

Beverley. — This town has a good trade in malt, tanned leather, and oatmeal. Lace-

making is carried on here, but not to any great extent.

Bildeford.—Here are many opulent merchants in the West India and American trade. Timber is here both plentiful and cheap: large quantities of earthen-ware are constantly manufactured here, and sent to Wales in exchange for provisions; and cargoes of oak-bark are exported to Ireland and Scotland. Here is a good trade to Newfoundland. The salt with which the herrings are cured is brought from Liverpool and Warrington, and being dissolved by the sea-water into brine, is boiled afresh into salt.

Bilston.—The contiguity of this town to Wolverhampton, and the benefit of the many branches of canals to all the chief trading towns of the county, have been the means of establishing here, within these few years, numerous manufactories for japanned and enamelled goods, particularly buckle chafes, which are wrought here in great perfection. Here are, also, furnaces for melting iron ore, forges and slitting-mills worked by steam-engines, there being considerable mines of coal, iron-stone, and quarry-stone in the neighbourhood. Bilston is noted for a deep orange-coloured sand, which is much sought after by distant artists to cast metals in; and likewise for a quarry of remarkable stones, lying horizontally one under another, of which the inhabitants make cisterns, troughs, &c., some of it is curiously variegated.

Birmingham.—The population of this extensive town is computed at 60,822 souls, whereof 50,234 are stated in the parliamentary returns as being employed in trade or manufactures; which shows the great traffic carried on here, particularly in the manufacture of cast-iron ware, buttons, plated articles, japanned ware, trinkets and jewellery, as well as fire-arms, which sell unrivalled in all the markets of the world. In the neighbourhood of this town are the famous Soho works, belonging to Mr. Boulton, forming one of the most extensive manufactories in the kingdom, as well for the number of hands it employs, as for the variety of articles it produces. It consists of four squares, with connecting ranges of shops, like streets, capable of employing about 1000 workmen in all the varieties of the button, buckle, plated, or argent moulu, steel and trinket, and cut-glass manufactory. The improved steam-engines of Messrs. Boulton and Watt, also made here, deserve to rank among the most extraordinary inventions of the present age. In 1797, an apparatus for coining and stamping was employed at Soho, by government, on a copper coinage of penny and two-penny pieces; and from that period various coinages of excellent penny, halfpenny, and farthing pieces of copper, have taken place at the same manufactory. Adjacent to

Soho is the manufactory for stained glass, of Mr. Egginton, the produce of which displays both taste and correctness of execution. In the town of Birmingham are numerous iron-founderies; there are also brass-works, aqua-fortis and vitriol manufactories. To purchasers of articles in the hardware line, the manufacturers allow discounts as various as from $2\frac{1}{2}$ to 50 per cent. These discounts for ready money are, however, in many instances, merely nominal, the manufacturer laying on profits proportionable to such deductions. Birmingham has been, for many centuries, noted for its extensive leather market, which was held by charter; and there are now annually two officers chosen as leather-sellers; though the tan-yards are now built upon, and the extensive leather-hall has been suffered to decay. The greatest advantage to this emporium of trade is the extension of late years of its canal navigation, now communicating with most parts of the kingdom. The old canal, cut in 1768, brings the raw materials and fuel from Wednesbury collieries; this, again, in 1772, was extended to Atherley, and thence communicates to the Severn by Shrewsbury, Gloucester, and Bristol, and joins the Trent to Gainsborough, Hull, and London. It has also a junction with the Grand Line canal, along Staffordshire to Manchester and Liverpool: hereby conveying the produce of its manufactories entirely by water carriage to the principal sea-ports of the British ocean, the Irish sea, and St. George's channel. By the new, or Birmingham and Fazely canal, there is a communication to Tamworth, Polesworth, Atherstone, Nuneaton, and Coventry, to Oxford and to London. In time of peace, the extent of the trade between Birmingham and the Continent is so great as to baffle description or calculation; merchants from many parts of the world, at such periods, either reside upon the spot, or have agents there, for the sole purpose of transacting their business with that town.

Bilston.—In the neighbourhood are dug up vast quantities of coals, and some iron ore; extraneous fossils are also found here. The river Boyd runs through the town, and on the banks of the river there are several mills for flattening and splitting of brass, grinding dye-wood, &c.

Blackburn.—About 6800 persons are employed here in the manufacture of cotton, calicoes, muslin, and Blackburn gray linen, shot with cotton. The trade of this place has wonderfully increased since the extension of its inland navigation, having a connection with the rivers Mersey, Dee, Ribble, Ouse, Trent, Severn, Thames, and Humber.

Blackwall.—The new wet docks across the isle of Dogs are here cut, with ranges of warehouses on each side, at which the largest ships may load, and unload, with the greatest ease and security; and several hun-

dred sail of vessels may be working at once. Blackwall is likewise remarkable for an extensive ship-yard, and wet dock, the most considerable private one in Europe; containing, with the water and embankment, nearly nineteen acres.

Bodmin.—has some manufactures of common serge; and here is a number of considerable dealers in wool, which is washed and sorted here, and employs the neighbouring parishes in spinning. The yarn is principally sent to Ashburton, and other parts of Devonshire.

Bolton le Moor.—This town has been considerably enlarged of late years, by its increase of fustian, and counterpane, manufactories, as well as those of calicoes, muslins, dimities, &c. and all kinds of Manchester goods, which are disposed of at Manchester, Liverpool, &c. and thence, by canal navigation, sent to all the interior parts of the kingdom, as well as to the ports for exportation. Between this place and Wigan, great quantities of cannel coal are found, of which substance the turners of Bolton make snuff-boxes, candle-sticks, &c. In Bolton 10,066 persons are returned as being employed in various manufacturing trades, handicrafts, &c.

Boston.—This town is situated on each side of the river Witham, near its influx with the sea, having thereby the advantages of a sea-port for small vessels; and it has, also, a navigation to Lincoln, partly by the Witham, and partly by a canal. The Hanse Towns established a guild for wool here; but on the prohibition of wool, the trade gradually declined; however, the inclosures of late years, and the navigation, have again revived its consequence. All the neighbouring country is rich in marsh land, and feeds vast numbers of sheep, and oxen, remarkable for their size, and fatness.

Bradford (Wilts).—The trade of this place has been considerably augmented by the Kennet and Avon canal, which passes Devizes and Trowbridge to Bath. It has several manufactories of the finest broad-cloths, and is particularly eminent for the nicest mixtures; the goodness and colours of the dyeing being attributed to the properties of the water of the Avon.

Bradford (Yorkshire).—Nearly 1290 persons are employed here in the manufacture of shalloons, tammies, calimancoes, wool-cards, combs, and leather boxes. Near the town is an extensive iron foundery, which employs several hundred persons in its various branches, where a number of cannon are cast.

Bridgenorth.—has manufactures of cloth, stockings, iron tools, besides all handicrafts in common with other towns of England. It has four fairs annually, resorted to from most parts of the kingdom, for cattle, sheep, butter, cheese, bacon, &c.

Bridgewater.—Through the convenience

of its navigation, this town has a very good coasting trade, and a number of coal ships are constantly employed.

Bridport.—Its chief manufacture is in twine, sail-cloth, and hats: for the two former it was so noted in the reign of Henry VIII. that it was enacted, "that all the cordage, &c. for the navy, for a limited time, should be made here, or within five miles, and no where else;" which act was confirmed for nearly 60 years.

Brigg.—The inhabitants of this town carry on a good trade in corn, coals and timber, particularly to Hull; they likewise send large quantities of coney wool to London, which is bought up by the wholesale batters.

Brighton.—The fishery here employs about 500 boats, carrying some three, four, or five men each. The mackarel season commences in April, and that for herrings in October. Independent of these, almost every kind of fish is found in plenty here.

Bristol.—The river Avon is here so deep, that vessels of 1000 tons may safely enter it. About 10,190 of the inhabitants of this populous city are employed in trade and manufacture. There is a dock here, which will contain 10 sail of large vessels, and further on there is another, where a building is erected on 14 pillars of cast iron, being a crane, a curious piece of mechanism, for loading and unloading ships. On the banks of the Avon are several dock-yards, and the merchants' floating dock exceeds in dimensions any even at Portsmouth, or Plymouth. In Bristol are some considerable woollen manufactories; and no less than 15 glass-houses, for which Kingswood and Mendip furnish the coals. In the rocks near Bristol wells, are found those hexagonal crystals, called Bristol stones. Between Bristol and Bath, on a place called Warmley, a company of Bristol merchants have erected an extensive manufactory of pins, and other brass articles, which employ several hundred hands. All the machinery is worked by water, which is raised by two steam-engines. Some French refugees, who have been long settled in Bristol, manufacture fine woollen cloths, of most excellent quality. Varnishes, of uncommon beauty, are also made here. In the city and its environs there are, likewise, numerous sugar-houses, aqua-fortis, and vitriol, manufactories. The foreign commerce of Bristol has decreased in proportion to the augmentation of the trade of Liverpool: it still, however, carries on a considerable traffic with the continent of America, with the West Indies, and with Ireland, whence it receives immense quantities of salted provisions, butter, linen, &c. &c. and in return, sends to the sister country, the chief commodities of England and its colonies. The intercourse between Bristol, and the Baltic, Spain, Portugal, and most other countries of Eu-

rope, in time of peace, is highly advantageous to the city. With respect to the inland trade, Bristol deals with almost every manufacturing town in the kingdom; and supplies Wales with vast quantities of merchandize, especially those of Ireland, the northern parts of Europe, and the colonies. All persons are free to trade here; and the freedom of the city can be purchased at a very moderate sum. No person shall act as a broker in the city of Bristol, till admitted and licensed by the mayor and aldermen, on pain of forfeiting five hundred pounds; and those who employ any such, to forfeit fifty pounds. 3 Geo. 2. c. 51.

Brisham. — The greater part of the inhabitants are employed in the fishery; which supplies London, Bath, Bristol, and Exeter. This place is much increased of late years, from its being the rendezvous of our men of war, particularly for watering, there being a number of shops built on shore for the sale of slops, provisions, &c. which have a great demand, and are very dear.

Bromsgrove. — The inhabitants are chiefly employed in the manufacture of nails, linen, and woollens. Here are, likewise, made vast quantities of needles.

Brosley. — The iron-works here are as considerable as any in the kingdom. Here is also a manufactory of glazed tobacco-pipes.

Buckingham. — The principal manufacture, and indeed the only one of note carried on in this town, is that of lace, made with bobbins, which is said to be nearly equal to the fine laces of France in appearance, and even in point of durability. An immense number of hands are engaged upon this fabric here, and throughout the county of Buckingham.

Burslem. — Nearly 5000 persons, inhabitants of this town, are employed in its extensive potteries.

Burton-on-Trent. — This town is famous for its strong ale, which is sent down the Trent to Hull, and thence exported both for English, and foreign, ports. It has manufactures of hats, cottons, tammies, and some articles of iron; particularly one for converting bloom, and scrap, iron into bars.

Bury (Lancashire). — Here upwards of 4500 persons are employed in the manufacture of cotton, in all its branches. There is also a considerable woollen manufactory here, besides capital printing works of calico and muslin in the neighbourhood.

Canterbury. — Its manufactures are worsted, silk, and cotton; the former furnishes employment for several hundred persons, particularly that called Canterbury muslins. Some French Protestants have been long established here, and to them is the city indebted for the estimation in which its silk manufactures are held, and for the great consumption those articles experience in the metropolis. Canterbury is surrounded on

all sides with extensive hop-grounds; and is famed for its excellent brawn. By a statute of 34 Henry VIII. no stranger shall keep a shop, or exercise any trade, in this city, without a licence from the mayor and corporation, under a penalty of 6s. 8d.

Carlisle. — Upwards of 2500 persons are here employed in trade and manufacture. The manufactures consist of cotton-yarn, cotton and linen checks, Osnaburghs, drills, worsted shags, stamped cottons, hats, cha-mois, tanned leather, lindsays, nails, hardware, dressed flax, ropes, &c. besides calicoes, muslins, fish-hooks, and whips.

Chatham. — This may truly be styled the first arsenal in the world. The dock-yard, including the ordnance wharf, is about a mile in length; and some of the store-rooms are 700 feet in length; the sail-loft being 209 feet long. Although the stores of the navy are so immense in these magazines, every thing is arranged in the greatest order. Here are upwards of 20 smiths' forges constantly at work; and some of the anchors that are made weigh near five tons. The rope-house is 1140 feet in length, in which cables are made 120 fathoms long, and 22 inches round. In the yard are four docks for repairing, and six slips for building new ships. The ordnance wharf, which adjoins hereto, was the original dock, where the guns, belonging to each ship, are arranged in tiers, with the names of the vessels they belong to marked above them. By a disagreement with the inhabitants of Rochester, when application was made to parliament for paving and improving the road, a new road was made to Canterbury, on the south side of the town, without passing through Chatham: which has, in a great measure, injured the trade of the latter.

Cheadle (Staffordshire). — This town being surrounded with coal-pits, there have been several manufactories established here in brass, copper, and tin. Vast quantities of tapes are also made here.

Cheddar. — The cheese of this place is, in flavour, little inferior to Parmesan.

Chepstow. — This place is the port of all the towns that stand on the rivers Wye and Lug; and vessels of 600 tons are built here. The merchants import their own wines from Oporto, as well as deal, hemp, flax, pitch, &c. from Norway, and Russia. Ships of 700 tons burthen come up to the town. It furnishes Portsmouth, and Plymouth, with considerable quantities of timber, and exports bark, iron, cyder, &c. to various parts.

Chester. — The chief trade of this city results from its intercourse with the city of Dublin, whence vessels bring large quantities of linens, which are sold at three fairs held in the course of the year, to the linen-merchants of the different trading cities and towns of England. Chester has some trifling manufactures of hats and gloves.

Chesterfield. — There is a silk and cotton-mill here, a manufactory for stockings and carpets; and several potteries have been established in its vicinity. The neighbourhood produces plenty of coal, and iron, which are worked to great advantage; and vast quantities of lead are sent hence by the New Canal, which joins the Trent below Gainsborough.

Chichester. — The inhabitants are principally employed in the manufacture of malt, and needles. The haven affords excellent lobsters; and every other Wednesday there is one of the largest markets for sheep and black cattle in the county, which not only supplies the city, but sends vast quantities to Portsmouth, and London. Chichester carries on a trifling commerce with some foreign ports.

Chorley (Lancashire). — Considerable manufactures of cottons, printed linens, &c. are carried on here. The neighbourhood abounds with coal, lead, alum, flag and mill-stones; the working of which, as well as the many machines erected of late years, in the calico, muslin, and fustian branches, have more than doubled the population. On the 4th of September a large fair is held here for toys, and woollen-cloths from Yorkshire.

Cirencester. — Upwards of 900 persons are here employed in trade and manufacture, chiefly that of woolstapling, and heavy edge-tools. Curriers' knives of the very best quality are made here. About 500 packs of wool are weekly sold in this market, and large quantities of white woollen-cloths are manufactured for the Turkey-trade.

Colchester. — The chief manufacture here is baize; there is a building called Baize-hall, where a corporation is appointed to try the goodness of the baize-manufacture, and settle every thing relating thereto. The baizes are of two sorts, namely, one of a fine quality, with a yellow list or selvage; and the second coarse, and thick, with a blue selvage. Of the latter large quantities are exported to Portugal. Much eringo-root is grown in the neighbourhood of this town, and candied here. Colchester has long been celebrated for its oysters, the best of which are called Pyefleet, forming a considerable traffic with the metropolis.

Corfe Castle. — More than 700 persons are here employed in trade and manufacture, mostly in that of clay, which is used for the potteries of Staffordshire; many are also engaged in working stone quarries. This place employs a number of vessels in the conveyance of its stone to the metropolis; and here are some rocks of variegated marble.

Coventry. — This city has now little trade except ribbon-weaving, which is performed by engines worked by women and girls. Gauzes, camlets, and lustrings of very excellent quality are made here. There is a

manufacture here of plaids, but it is far inferior to the Scotch fabric.

Crosby Ravensworth. — A number of swine are bred in this parish, and the hams cured here, as well as in other parts of the vicinity, are of a peculiarly fine flavour; which is conceived to be in consequence of their being dried over peat.

Crowland. — This place has a great traffic in wild ducks; in the ponds are kept a number of decoy-ducks, which are perfectly tame, and sometimes take a flight, of several weeks together, as is supposed, to the continent; they return with flocks of wild ducks in their company, which they lead to the ponds of their respective owners, where nets are so artfully spread from the trees, that a flock of 2000 or 3000 are often taken at once.

Croydon — has some capital manufactures of paper, printed cottons, besides several bleach-yards. Immense quantities of wood, corn, and barley, are sent hence to London.

Dartford. — The Gunpowder-mills here give celebrity to the place.

Dartmouth. — A great number of vessels are employed here in the pilchard fishery; besides which, the town has a considerable export trade, and imports wine, oil, fruit, &c. The export trade of Dartmouth is confined to France, Portugal, and the Mediterranean. As the chief employment of the inhabitants is commerce and shipping, no manufacture of consequence is to be looked for at this place, though it is a considerable nursery for the British navy; the fishery alone employing near 3000 men, a certain number of whom the proprietors are obliged by law to select from landmen.

Deptford. — The royal dock-yard of Deptford was first erected in the reign of Henry VIII. The store-houses, which form a square, have had several additional buildings; the whole yard covers 51 acres of ground, containing two wet docks, one single and the other double, three slips, a bason, and two ponds for masts, with various manufactories for anchors, cables, masts, blocks, &c. The number of the artisans constantly employed, is about 1500. At Deptford there are several docks for ship-building, the property of private individuals. The Red House, a little to the north-west of Deptford, is the grand store for provisions, &c. for the royal navy; and here persons are stationed for the purpose of examining the articles supplied to the navy by the different contractors, and ascertaining whether they are conformable to the description given of them in the invoices, and worth the prices charged.

Derby. — In this town are some extensive silk-mills, upon a very ingenious plan, the first of which was erected from a model brought from Italy. In this machine are nearly 100,000 movements, put into action by a single wheel, any one of which may

be stopped at pleasure. Every time this wheel goes round, which is three times in a minute, the machine works 73,728 yards of silk. By this mill the raw material is prepared for the warp. Derby has also a very extensive manufactory of porcelain, which, for fineness of texture, and brilliancy of colours, equals that of China. A number of persons are employed in turning vases, urns, and various chimney-ornaments, of marble, spar, and petrifications, which abound in this vicinity. Here are made fine cotton and worsted stockings. The malting trade is carried on to a considerable extent also.

Derizes. — Here upwards of 1700 persons are employed in making malt, and the manufacture of druggets, serges and kerseymeres. Some light Spanish cloths of tolerably good fabric are likewise made in this town.

Donnington. — The cultivation of hemp for the London market is carried on to a considerable extent in this vicinity.

Dorchester (Dorset) — has entirely lost its famous manufactures of broad cloths, and even its trade in serges is, at the present period, of very little consideration. The inhabitants of Dorchester derive large profits from the numbers of fine sheep fed in the neighbourhood. The ewes in general are very prolific, a circumstance attributed to the aromatic herbs with which the pasturage is interspersed. This place is noted for the excellency of its ale, which is sent to all parts of the kingdom, and even exported.

Dorking. — A great trade is carried on in lime, which is accounted superior to any other made in the country. A great traffic in meal is likewise supported in this town. Dorking is noted for its breed of poultry, which is remarkably large and fine, and singular for the birds having five nails in each claw. Capons, bred here about Christmas, often weigh seven or eight pounds out of the feathers. In the neighbourhood are a number of corn-mills.

Dover — has some rope-works, and a small trade with the ports of France in time of peace, and a trifling coasting commerce, but is principally known for its being the place through which most persons enter England coming from the continent.

Downham (Norfolk) — has a well supplied market, and is particularly noted for its sale of butter, which is conveyed by the river Ouse to Cambridge, whence it is sent by land-carriage to London, and there sold under the denomination of *Cambridge butter*. The sale of this commodity was formerly averaged at 2000 firkins per week.

Downton (Wilts). — The principal employments in this place are lace-making, and malting. It has also a good paper-mill; a grist-mill, and a tan-yard, besides a considerable branch of the tick-weaving business.

Droitwich. — The principal trade here is in the manufactory of fine white salt, deemed to be the best in all Europe. The brine springs are so strong here, that the pits are continually running over, being much stronger than those in Cheshire; they contain about one-fourth salt, while those at Nantwich yield only one-sixth. The brine is pumped out of the pits chiefly by horses into large reservoirs, from which there are trees laid to the different salt-works. By turning a cock the brine is let into boilers of wrought iron, from 14 to 24 feet long, and from 12 to 20 wide, and about 2½ feet deep. It takes near twenty hours boiling, and the salt remains at the bottom of the pans, whence it is transferred into oval wooden baskets, and carried to a stove, where it is left about forty hours to dry, and then is fit for use. A canal conveys the salt to the Severn, whence it is disseminated throughout the kingdom. Some white woollen-cloths are made here for exportation.

Dudley — has most extensive manufactures of nails, and hardware in general.

Dunstable — has long been famous for its manufacture of various articles of use and ornament in straw, particularly of hats, known by the name of *Dunstablers*: it used to employ a great number of women and girls; but this manufacture has been almost superseded by the introduction of that called Leghorn. The vicinity is remarkable for the size of its larks, which are caught here in great quantities, and sent to the London markets.

Durham — is noted for its manufactures of stuffs, and carpets, as likewise for its excellent mustard; large fields of the plant, which produces it, being cultivated in the neighbourhood of this ancient city.

Dursley — has a considerable traffic in broad-cloth, and card-making for clothiers. Adjoining the town is an extensive paper-manufactory. In this neighbourhood is a peculiar rock or stone, without any chap or slit, called Towle stone, which, though soft in hewing, becomes exceedingly durable when exposed to the air.

Easingwold. — The inhabitants are chiefly employed in curing bacon and making butter, which are sent by land-carriage to York, and thence by water to London.

Eastbourne. — In the months of July and August, large flights of birds, called wheatears, are caught here by shepherds, who ensnare them into holes cut in the turf; they are reckoned a very great dainty.

Ely. — Eels abound here, as do osiers, of which vast quantities are cut down for the use of basket-makers. The adjacent grounds are chiefly market-gardens, the soil being so fertile, that it supplies most of the neighbouring towns with vegetables, even as far as Cambridge, and is particularly noted for its strawberries.

Epping. — The butter made here, and in the neighbourhood, is in particular esteem, and brings a higher price than any other at the London market; its pork and sausages are also in equal repute.

Etruria. — This is the seat of the most considerable pottery in England, particularly of those kinds denominated *Staffordshire-ware* and *Wedgewood*. The latter is very beautiful, and receives its name from Mr. Josiah Wedgewood, the first manufacturer, whose ingenious imitations of the Etruscan vases have obtained this place the classic appellation of *Etruria*.

Exeter. — A considerable trade is carried on here in the manufacture of serges, perpetuanas, and various woollen-goods; and here is held a weekly serge-market, the greatest in England, next to that of Leeds; it is said that a week's sale here has produced 100,000*l*. There is a large cotton-manufactory here, besides manufactures of coarse and fine hats, and of white Osnaburghs. Exeter maintains, in time of peace, a most advantageous commercial intercourse with the ports of Spain, Portugal, Italy, Holland, and Germany. In the year 1802-3, this city furnished Spain with merchandise to the amount of 200,000*l*. and upwards.

Falmouth — carries on an important pilchard-fishery. Its commerce with Spain, Portugal, America, &c. has, in the course of a very few years, raised it to a level with several of our most thriving and populous ports.

Fareham — has a manufacture of sacking, and ropes for shipping; of which last it supplies great quantities to Portsmouth: it has also a considerable trade in coals.

Farnham (Surry). — In the neighbourhood are many extensive hop-plantations, the produce of which is reckoned superior to the Kentish, both in quantity and quality. Here is likewise a great traffic in Welsh-hose.

Faversham. — This place is noted for its extensive manufacture of gunpowder; several of the mills belong to government. It has also a considerable oyster-fishery, in which nearly 200 families are employed.

Folkestone. — A multitude of fishing-boats belong to Folkestone-harbour, which, during the season, are employed in catching mackarel for the London market, and about Michaelmas in the herring-fishery, on the Norfolk, and Suffolk, coasts, for the merchants of Yarmouth, and Lowestoff. Many curious strata of pyrites, talc, fullers'-earth, and a kind of sulphur, are found here. Contraband trade used to be carried on in this place to an alarming extent, but it is much diminished.

Fordlingbridge. — Upwards of 890 persons are here engaged in the fabrication of ticking, and in calico-printing.

Fowey. — The harbour of Fowey is capable of containing vessels of 1000 tons at all times of the tide. The inhabitants carry

on a considerable trade in the pilchard-fishery.

Freefolk. — In this hamlet is a paper-mill, where the finer kind of paper is manufactured, particularly that sort used by the Bank of England.

Frome. — Upwards of 2200 persons are occupied in various trades and manufactures, principally of broad cloths, and kerseymeres, and in an extensive trade in card-making for wool-combers. On the banks of the river Frome are several mills for fuling of cloth, rolling of iron, &c. The ale of Frome is highly esteemed.

Gainsborough — carries on a considerable coasting-trade with the northern parts of Lincolnshire, and inland traffic through Nottinghamshire, by the river Trent.

Gisborough. — This place has long been noted for its alum-works, the mines of which were first discovered in the reign of James I. or Elizabeth, by Sir Thomas Chaloner. The soil in the neighbourhood is particularly fertile, and produces earths of different colours, with a little iron ore.

Gloucester. — Upwards of 2500 persons are employed in trade and manufactures, particularly those of pin-making, wool-stapling, and rope-making; the value of pins sent weekly to London is estimated at 20,000*l*. The cheese, and cider, made in the neighbourhood of this city are too well known to need any eulogium in this place; the value of the former article annually sold throughout the British empire, exported to the continent of Europe, to that of America, the East and West Indies, baffles every attempt at estimation. There are several glass-houses here, in which coarse glass bottles, and glass bells for gardens, are fabricated. A canal has been made from this city to Berkeley, capable of conveying vessels of 200 tons burthen, by which the difficult navigation of the Severn is avoided.

Godalming — has several manufactories for weaving stockings, and one for the patent fleecy hosiery. Wool-combing, spinning of worsted, and weaving of coarse woollen-cloth, also give employment to a number of hands in this parish. On the river are a grist-mill, two paper-mills, and three corn-mills.

Gosport. — This is a place of great trade and business, but more particularly so in time of war, from the number of docks in the King's service. Here is a large iron-foundry, in which various articles are cast for the use of the navy. There are some capital porter-breweries in and about Gosport.

Gravesend. — The gardens round the town are so rich and fertile, that they not only supply the numerous shipping, which stop here, with all kinds of vegetables, but also furnish the London market; this place is remarkable for its excellent asparagus.

All outward-bound vessels are obliged to bring to here, till they have been examined by the proper Custom-house officers, and receive their clearances. The labouring people spin hemp for the making of nets and ropes.

Greenwich, — from its vicinity to the metropolis and to the river Thames, is, of course, the seat of certain manufactures, and of some trade; but its principal claim to celebrity is founded on its magnificent pile of building denominated Greenwich Hospital, for the reception of seamen disabled by age, or maimed either in the king's or the merchants' service; and on the royal observatory, which was erected here before the end of the 17th century.

Grimsby, Great. — The principal traffic of the town is in coals and salt, by the river Humber, here being no manufacture of any note; but it is a place rapidly increasing in importance, from its improved harbour, where the trade of the northern kingdoms is admitted without the heavy dock duties payable at the neighbouring port of Hull.

Halifax. — The woollen manufacture has long been established in this populous town, and from the favourable situation of the place, and the many rivulets, there have of late years been erected numerous mills and machinery. Halifax was noted many centuries ago for the manufacture of woollen goods; it did not, however, attain any considerable importance till the reign of Henry VIII. About the beginning of the 18th century, the manufacture of shalloons was introduced, and about the middle of the same century the manufacture of figured and flowered stuffs. The weavers of the surrounding districts bring their goods undressed to the market, and the following are the principal goods manufactured in and about Halifax: — Shalloons, figured and plain lastings and amens, plain and dyed Russels or Florentines, superbearragans or serge imperial, quilted lasting, serge, moreens, tammies, plain calimancoes, &c. Shalloons are woven expressly for the Turkey market, and are not pressed; they are, for the most part, dyed of a scarlet colour, and are sent by the Turkey merchants of London to the Levant, where they are chiefly used for turbans. Formerly the greater part of the above goods passed through the hands of the London merchants, but now they are mostly exported directly from the port of Hull. In time of peace, large quantities of woollens have always been sent to South America by way of Cadiz; but now they are exported directly from our ports to Brazil and Peru. There are excellent cards for combing wool made at Halifax. For the convenience of the manufacturers, there has been erected an elegant edifice, called the Piece-hall: it is in the form of an oblong square, occupying a space of 10,000 yards, having 315

distinct rooms for the lodgment of goods, which are open for sale once a week, from ten till twelve o'clock. A vast number of woollen stockings, chiefly made from Scotch and North of England wool, are woven in this town and the environs. The Leicestershire, South-down, and Merino, wools are employed in the manufacture of the fine cloths.

Harborough Market. — A considerable manufacture of tammies, shalloons, plain and figured lastings, &c. employs a great number of persons in this town, and its neighbourhood; and in some years it has been computed 300,000*l.* have been returned in tammies only. It is famous for its two great fairs, one on April 29th, the other on October 19th. The last mentioned continues for ten days, and is perhaps the largest for horned cattle in the kingdom. The Irish and Scotch beasts come hither in prodigious droves, and are purchased to be fed in the marshes of the eastern counties, for the winter markets of London.

Harwich. — The harbour here is not only safe and convenient, but of great extent, capable of receiving the largest ships of war, and the greatest number. Harwich carries on a large trade with Holland and Germany. Suffolk and Essex obtain their chief supplies of coals from this town. Several fish-machines run from Harwich in a very expeditious manner to supply the London market.

Hastings. — This is the principal of the Cinque Ports, and had formerly a noted harbour, but now has a road only for small vessels. Here is a regular Custom-house, with an establishment of twelve riding-officers, this place being notorious for a trade in contraband goods. The herring and mackarel fisheries here give employment to a number of hands, and furnish a good supply to the London market.

Hawthead. — This is the principal town in what is called the district of Furness, or woody fells in Lancashire; the woods are chiefly charred here at the growth of about fifteen years, for the uses of the numerous founderies and forges in the neighbourhood. The mountains in the vicinity produce plenty of copper ore and slate.

Helstone. — This is a stannary town, being one of those appointed for the stamping of tin, which creates a good trade here. Near this place the tin ships take in their lading.

Hereford. — The manufacture of gloves, which at one time was carried on to a great extent in this city, has of late years been on the decline. In the neighbourhood all the hedges are planted with apple-trees, and a great deal of excellent cider, which bears the name of the county, is made here, part whereof is sent to London, &c. and the remainder consumed in the city and its vicinity.

Hertford. — The principal commodities of

this place are corn, malt, and wool. It has been computed that 5000 quarters of malt are weekly sent hence to London by the river Lea. Fairs are held here triennially, at which there are generally good shows of black cattle and horses.

Hitchin. — Malting is the chief trade here. The market on Tuesday is very considerable for wheat, which is excellent of its kind, and sold toll free.

Honiton. — Here is a small manufacture of serge, but the principal occupation of the industrious inhabitants consists in making broad lace. Honiton supplies the London market with large quantities of butter.

Horncastle. — Tanning hides is the chief occupation of the working people of this town; but one of the greatest horse-fairs in the kingdom is held here in the month of August. It is professed to be holden on the 21st day of that month, but actually commences from the very first day of it, and sometimes continues for several days after.

Hounslow. — About the middle of the well-known heath, which bears the name of this town, are powder-mills, and not far distant are some copper-mills.

Howden. — On the 25th of September, here commences one of the greatest horse-fairs in the kingdom, which continues till the 5d of October.

Huddersfield. — The chief manufactures of this place consist of serges, kerseymeres, frieze, and narrow, and broad, cloths. There is a very extensive cloth-hall here, which was erected in 1765. The cloth-market is held on Tuesday, commencing early in the morning, and closing at half past twelve at noon: it is very numerously attended by the wool-staplers, &c. from Leeds, Halifax, and Wakefield.

Hull. — The rank which Hull is entitled to hold, in consequence of its extent, its population, and public accommodations, is very considerable; but its chief influence, in the scale of national importance, arises from its increasing commerce. The tonnage of Hull was, several years ago, only inferior to that of London, Liverpool, and Bristol; its customs only to those of the two first. It sends, at present, one-third as many ships to Greenland as London, and, exclusive of London, more than all England together.

By means of the great rivers Humber, Ouse, and Trent, Hull has the import, and export, trade of many of the northern, and midland, counties; its foreign trade is chiefly to the Baltic.

It is difficult to collect authentic information of every variety of manufacture existing in Hull, and the mere detail of the ordinary operations of artisans and labourers would be tedious and unimportant. The most extensive and lucrative manufacture in this town is, perhaps, that of expressing and refining oil from linseed, and

afterwards preparing the residue for feeding of cattle. The process is chiefly effected by mills, worked by wind. There are several oil-mills here, however, set in motion by steam-engines, and a few by horses. The knowledge and practice of this branch of manufacture was first introduced into Hull by a native of Holland. The oil thus produced, is, when refined, of singular utility in the clothing business.

An iron-foundry, sugar and soap-houses, several whale-oil yards, a lead-manufactory, numerous dry-docks and ship-builders' yards, where a great number of hands are constantly employed, and several large breweries, are the chief establishments.

The Grand Dock at Hull extends, in length 700 yards, in width 85, and is 22 feet in depth. It is capable of containing 130 sail of ships, of 300 tons burthen. With its wharfs and quays, this dock covers a space of more than 13 acres. Hull boasts of an Exchange and Trinity-house, much on the same plan with similar institutions in the metropolis. The population of Hull is said to be more than 50,000 persons.

Ilfracombe. — This place has a very commodious haven, and a newly-erected pier, and the light-house is so conveniently situated, that vessels can run in here when they cannot make Bideford, or Barnstaple; so that much of the port business of the latter places is done here. The vessels belonging to the port are chiefly employed as coasters in carrying ore, corn, &c. from Cornwall and Devonshire to Bristol, and in fishing. The Ilfracombe fishery supplies the Bristol market with large quantities of turbot, soles, &c.

Illogan. — The copper-mine, called "Cook's Kitchen," in this parish, is esteemed one of the richest in Cornwall. For several years it produced, after paying all expences, a clear profit of 80,000*l*.

Ipswich. — The principal trade of the town is, at present, in malting and corn. Great quantities of ship-timber are sent hence to the different dock-yards, especially to Chatham. Ipswich has a share of foreign commerce, a coasting-trade, and sends ships to the Greenland-fishery. Vessels of large burthen cannot come up to the town. There are some salt-works, but of no great repute, in the neighbourhood.

Kendal. — The manufactures of cottons, coarse woollens, linseys, druggets, worsted stockings, flannels, and serges, are here very considerable, and there are several small manufactures of hardware. Here are seven trading companies, each having their hall, viz. mercers, tanners, glovers, sheermens, cordwainers, tailors, and pewterers. Wool-cards, fish-hooks, and gunpowder, are made in the town and its vicinity. Kendal has an inconsiderable silk-manufactory, the raw material consumed in which is supplied by the silk-merchants of London. By the in-

land navigation the town has a communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Severn, Humber, Thames, Avon, &c.

Keswick (Cumberland). — Upwards of 300 persons are employed principally in the manufacture of coarse woollens and linens. Some years ago an establishment was formed for the spinning of twist. Keswick has long been noted for its lead-mines, the produce of which is prepared at a smelting-mill on the river Derwent.

Kidderminster. — This populous town was famous for its manufactures in the reign of Henry VIII. for broad-cloths, then for wolseys, and afterwards for bombazines, crapes, and poplins. The Scotch and flat carpet-manufacture, known by the name of *Kidderminsters*, was introduced here about 1735; some years since the cut carpet was wrought here with great skill; and in 1772, the number of looms in the neighbourhood and town amounted to upwards of 250. This manufacture gives employment to more than 3000 people, of which number about one half prepare the yarn for the manufacturers, and also supply that article, in a considerable quantity, to various parts of the kingdom. A silk-manufactory was erected here in 1755, and also one in imitation of Marseilles quilting. Woollen-plush is also made here for the Portuguese market. Hearth-rugs, of very beautiful patterns, and excellent fabric, have within these few years been introduced into this town. The Staffordshire and Worcestershire canal, which passes this place, opens a communication to Hull, Liverpool, Bristol, Manchester, and many other trading towns.

Knaresborough. — There is an extensive manufactory of linen-cloth here, in which 1000 yards have been said to be woven weekly; and the fields are famous for producing liquorice.

Lambeth. — In this extensive parish a vast number of persons are employed in all those handicraft trades which are necessary to supply the wants and desires of the inhabitants of that opulent city, whereto it is adjacent, and of which indeed it may be said to form a part. The manufactures too are various, vinegar, artificial stone, patent shot, hats, boats, ropes, coaches and harness, oil, sugar, &c. &c. not necessary to be further particularized, as Lambeth possesses them only in common with the other environs of the metropolis.

Lancaster. — The principal manufactures here are those of sail-cloth, coarse linens, and cabinet ware. By the inland navigation this town has communication with the Mersey, Dee, Ribble, Ouse, Trent, Derwent, Severn, Humber, Thames, Avon, &c. Lancaster is situated on the river Lime, which forms a harbour of moderate size. The merchant shipping is chiefly employed in the West India, American, and Baltic trades. It has

a long fine quay, on which is a range of noble warehouses. The principal exports are hardware, woollen-goods, cabinet-ware, &c. The cabinet-makers of Lancaster are celebrated for their ingenuity.

Leeds. — Above 20,000 persons are here employed for the most part in the woollen manufacture. The trade in woollen cloth, in this town, is perhaps the greatest in the world; and for the accommodation of the clothiers, there are two spacious halls, as well as a third for worsted goods. About six o'clock A.M. in summer, and about seven in winter, the market-bell rings; upon which, in a few minutes, without noise, hurry, or the least disorder, the whole market is filled, all the benches covered with cloth, as close to each other as the pieces can lie lengthways, each proprietor standing behind his own goods: as soon as the bell has ceased ringing, the factors and buyers of all sorts enter the hall, and walk up and down between the rows, as their occasions direct: when they have pitched upon their cloth, they lean over to the clothier, and by a whisper the price is stated; one asks, the other bids, and they agree or disagree in a moment. In little more than half an hour all the business is done: 10 or 20,000*l.* worth of cloth, and sometimes much more, are bought and sold with a whisper only: the laws of the market being more strictly observed here than at any other place in England. That called the mixt cloth hall was erected in 1758, by a voluntary subscription of the clothiers. The white cloth hall is appropriated to the sale of white cloth only. Almost every operation in the manufacture of broad cloths, in, and near, this town, is performed by machinery. This enables the manufacturers to sell their goods at a very low rate, and occasions very few hands to be wanted in the first stages of the manufacture, particularly in carding or scribbling the wool, and in spinning it. Here is also a flourishing manufacture of carpets, besides mills for cutting tobacco, several potteries, &c. The wools employed in the clothing manufactures of Leeds (which are of the coarser kind, usually denominated Yorkshire cloths), are brought from Norfolk, Cambridge, most of the northern counties, and from Scotland. By means of the rivers Aire and Calder, and the canal navigation, Leeds has communication with Wakefield, York, and Hull; from which latter place woollen goods are usually shipped to foreign parts. The carriage of coals to the interior of Yorkshire is also a great source of traffic; these are carried in vessels from 45 to 60 tons burthen, by means of the rivers Aire and Calder; and by the Selby canal, to Selby, York, Howden, Hull, Beverley, and all the intermediate towns lying on the rivers Ouse and Humber.

Leicester. — The principal trade in this town is in the manufacture of woollen stock-

ings, as that of Nottingham is of *silk* and *cotton*. Immense quantities are made here, as well for home consumption, as for exportation. It enjoys great local advantages from having wool of every degree of texture, from the coarsest to the finest produced in this and the immediately-neighbouring counties. The combing and spinning of the wool from which the stockings are made, give employment to the poor of the town and its vicinity. It has also a brass and an iron foundry. Leicester is supplied by canal navigation with coals, deals, and groceries, and communicates with all the principal towns of England.

Lincoln.—The corn, and wool, trades are almost the only ones here, and large quantities of both articles are sent into Yorkshire, whence the vessels return laden with coals.

Liverpool.—The second port in the British empire, to which rank it has been raised in modern times, by a concurrence of favourable circumstances. In the beginning of the 18th century, it was an inconsiderable place. In 1700, the number of inhabitants was about 3000; in 1720, above 10,000; in 1750, about 12,000; in 1740, more than 18,000; in 1760, near 26,000; in 1790, nearly 60,000. According to the census of 1821, the population amounted to 118,972.

Originally the trade of Liverpool was only with Ireland; which induced many Irish merchants to settle here. The greatest part of the trade with the Isle of Man was likewise gradually transferred hither. In 1720, some salt was exported; in 1730, we first find it recorded, that *several* ships had sailed from hence for the coast of Africa. The first dock was begun in 1710, which was followed by several others, and at length formed an excellent harbour, which was frequented by the ships from the Baltic and other parts of the north, being more certain of finding a return-cargo here than at Bristol. If disappointed of that, they could at least depend upon obtaining the useful article salt, for ballast or dead weight. The canals and inland navigation opened to Liverpool a most advantageous communication with the manufacturing places and chief towns of the kingdom. The increasing manufactures of Lancashire created a continual demand for raw materials from abroad; and an extended population, in a district which is so little distinguished by the bounty of nature, required a proportionate importation of provisions. From these and other circumstances every thing was in a state of activity and advancement; the canals branched out in various directions; the salt-works of Cheshire, by a more diligent and an improved mode of management, became more productive; the manufactures of Lancashire, Staffordshire, Yorkshire, &c. were carried to the greatest perfection, and the most flourish-

ing condition; Scotland advanced in industry, wealth, and population; as did likewise Ireland. The slave trade, that blasted Africa like a pestilence, came almost exclusively into the hands of the Liverpool merchants; and thus increasing a most lucrative connection, formed with the West Indies, and cemented in blood: the commerce with the Baltic also became more considerable: the trade to the North Sea increased; the exports from Liverpool for the supply of the American market were several millions per annum; and the intercourse between it and Spain and Portugal has proved most lucrative not only to the town itself, but to many of the manufacturing places of England. Liverpool enjoys the twelfth part of the navigation, the fourth part of the foreign trade, and the sixth part of the general trade of Great Britain: half as much of commerce as London: it was polluted with five-eighths of the African slave trade of the United Kingdom; three-sevenths of the same abominable traffic is computed with the rest of the empire and Europe. The rapid progress, and present flourishing state of this place, may in a great measure be ascribed to the commercial and speculative spirit which prevails here. Liverpool is situated on the inlet of the sea, into which the Mersey flows, about three miles from the mouth of that river: the waters of the Mersey are not sufficient to fill the broad channel, and at low water the depth is only 15 feet, at spring tides it is 30; the harbour has been formed entirely by means of large and expensive docks.

On the quay stand large warehouses, among them the extensive tobacco warehouses belonging to government, which will hold 7000 hogsheads, and yet, on some occasions, there has been want of room. Liverpool trades to all parts of the world, now even to the East Indies, since that trade was thrown open, which compensates to a certain degree for the loss of the African trade in slaves. In war-time Liverpool is more enterprising with respect to the fitting out of privateers than any other port in Great Britain: it is on record, that from July 1789 to the end of 1799, there sailed from this port 396 armed ships without convoy; 32 from London, 50 from Lancaster, and 196 from all the other British ports, with exception of such as sailed to the Baltic and other places in the North. The cotton trade of Liverpool is very extensive.

Of the manufactures of Liverpool there is not so much to be said; there are several sugar-houses, manufactories for tobacco-pipes and pottery; some iron foundries; about 50 breweries; watches in large quantities, as well silver and gold as metal, are made for exportation; in the vicinity there has long been a steam-engine for cutting and flattening iron; likewise works for the preparation of vitriol and white-lead, be-

sides many windmills, the most for the grinding of corn, and the rest for cutting of dye-woods. The preparation of snuff and tobacco, the cutting, plating, &c. of which is performed by means of machinery, may be considered as one of the staples of Liverpool. There are, besides, an extensive stocking manufactory, salt, iron, and copperas works. Ships of considerable burthen go up the Mersey, almost as high as Warrington, chiefly for rock-salt and Cheshire cheeses.

London.—It must be acknowledged, that the feature which above all others marks this great capital of the first trading nation in the universe, is the magnitude of its commerce. Situation, a long-continued current of successful accidents, with the genius for gain elevated above, and directing the whole to, its own purpose, although not to the exclusion, yet to the subjugation, of all other objects, have, in London, reared up an emporium, that the merchant of other nations, with all his knowledge of the power of commerce, surveys with inexpressible wonder. The commerce of London has three principal points, 1st, the port of London, with the foreign trade and domestic wholesale business; 2dly, the manufactures; and lastly, the retail trade. The annual value of the imports, and exports, of London has been, long ago, stated at upwards of sixty millions sterling, and the annual amount of the customs at more than six millions: employing about 3500 ships, British and foreign; the cargoes annually entering the port not being less than 13,500, and on an average 1100 ships are in the river; together with 5419 barges and other small craft, employed in lading and unlading them; 2288 barges and other craft engaged in the inland trade; and 3000 wherries or small boats for passengers. To this active scene which the port of London exhibits, are to be added about 8000 watermen actually employed in navigating the wherries and craft; 4000 labourers lading and unlading ships; and 1200 revenue officers constantly doing duty on the river, beside the crews of the several vessels. This scene occupies a space of six miles on the Thames, from two miles above, to four miles below, London bridge and Limehouse. The East and West India trades indubitably constitute the largest and most important branches of the foreign commerce of the metropolis. The West India trade, though less splendid in its form, is equal in commercial importance. The docks and warehouses in the Isle of Dogs, for the accommodation of this trade, are of the most capacious extent, and at once convey a just idea of the value and importance of English commerce. These immense works receive the whole of the ships in the West India trade; and are among the prominent

curiosities of the British empire: they were undertaken according to an act of parliament passed in 1799, entitled “The Wet Dock Act;” the entrances into them are at Blackwall and Limehouse-hole; their scite is wholly on the Isle of Dogs, and upon the wharfs and quays adjoining them, all West India ships unload and load their cargoes. The northern dock for unloading inwards, covers a space of thirty acres, and is capable of containing from two to three hundred sail of ships; the smaller dock, situated to the south of the other, covers an area of twenty-four acres, and is devoted solely to the business of loading outwards: both docks are surrounded by immense ranges of lofty warehouses.

Notwithstanding these docks have occasioned a very important trade to be removed to a considerable and even inconvenient distance from the metropolis, yet the advantages to the port of London are, upon the whole, incalculable. The West India trade generally arrives in large fleets, and occasions so much crowding, confusion, and damage in the river, that these ships being disposed of in the docks, the extensive trade of the port may be carried on with pleasure and convenience.

The East India Company have likewise constructed docks at Blackwall, for the purpose of loading and unloading their ships. To convey an idea of the magnificence of these docks, it will be sufficient to observe that they are worthy of the proprietors; besides the East, and West, Indies, London carries on immense traffic with the continent of America, with Russia, Prussia, Germany, Poland, the Netherlands, and the whole of the north of Europe, with France, Italy, Hungary, &c. &c.

A war of unexampled duration wholly impeded, for several years, the old commercial currents; and even the tardy return of peace has not restored all of them to their accustomed channels. On the whole, although there is every reason to believe our commerce is even in a progressive state, yet the abolition of the African slave trade, the increasing manufactures of North America, and the unsettled state of the southern provinces of that continent, set all permanent calculations and estimates at defiance; we shall, therefore, (after observing, that between London and Dublin, as well as with most other ports of Ireland, there is a constant intercourse; and that as the balance of trade is generally in favour of the English metropolis, many of the merchants here derive immense profits from negotiating bills upon the sister country; and that the chief part of the trade between Scotland and London is carried on by means of the coasting vessels, some of which almost daily set sail from the wharfs about Wapping for the Scotch

ports;) proceed in the most acceptable mode, in which we can occupy the remaining space we can dedicate to this single article, to give a succinct account of some of the public establishments in London, in which most commercial men are, in different degrees, interested; as, also, a very general view of the manufactures peculiar to it.

Of the domestic wholesale business of London, it is enough to say, that it is immense; and that a very great portion of the consumption of the whole island passes through the metropolis, as the general mart of the country.

The Bank of England was first established in 1699, and it may justly be styled the grandest institution of the kind in Europe; further particulars on this subject will be found under the article BANK. The Stock Exchange, in Capel-court, was erected in 1801, by subscription, in transferrable shares of 50*l.* each: no persons are allowed to transact business here but those who are ballotted for by a committee annually, and on their election to pay ten guineas: the business transacted here relates entirely to the sale and purchase of stock in the public funds, exchange bills, India bonds, &c.; it is open from ten in the morning till four in the afternoon, except on bank-holidays, when it is shut.

The Royal Exchange was erected in 1556-7, by Sir Thomas Gresham. Here, between the hours of three and four, most of the merchants of London assemble, and transact business by negotiating foreign bills, &c. Over the Exchange is the noted coffee-house called Lloyd's, frequented by underwriters, and others concerned in shipping. The Custom-house was built in 1817: there is one apartment in this large pile of building, denominated the Long Room, where the commissioners and clerks attend between the hours of nine and three, and in which entries inwards and outwards are passed, duties paid, affidavits made, and cockets received. The clearing office is situated in the lower part of the Custom-house, and here application must be made for leave to ship goods. The Excise-office, in Broad-street, erected in 1768, is destined to the receipt of a branch of the public taxes called the excise duties. The Post-office, at present in Lombard-street, but about to be removed to the east end of Newgate-street, may truly be said to be the most important spot on the face of the globe: it receives information from the poles, it distributes instructions to the antipodes, it connects together more numerous, and distant, collections of men than any other similar establishment: inland letters are here received till seven o'clock P. M.; after that till half-after seven, a fee of sixpence being

paid with each letter; and from half-after seven till a quarter before eight, the postage being paid, as well as the fee of sixpence. The postage of all letters for foreign parts must be paid when put into the office. Letters for the East Indies are to be delivered at the India-house. Those for the coast of Africa, or any single settlement in particular parts of the world, at the respective coffee-houses, where bags, which wait the sailing of ships, are kept; or at the ship letter-office. For the two-penny post, or the delivery of town-letters, there are two principal offices, one in Lombard-street, and the other in Gerard-street, Soho.

The Trinity-house, situated on Tower Hill, is appropriated to the use of a corporation, appointed to superintend the interests of the British shipping, military and commercial; this corporation examine the masters of the king's ships; appoint pilots for the Thames; erect light-houses and sea-marks; grant licences to poor seamen, not freemen of the city, to row on the Thames; and superintend the deepening and cleansing of the river.

We shall now proceed to say a few words relative to the manufactures of London. The manufactures of London are often overlooked in the midst of its other, and more prominent, branches of commerce; but, whether they are considered in their magnitude, or value, they are very important: they consist chiefly of fine goods, and articles of elegant use, brought to more than the ordinary degree of perfection; such as cutlery, jewellery, articles of gold and silver, japan-ware, cut glass, cabinet-work, and gentlemen's carriages; or of particular articles that require a metropolis, or a port, or a great mart, for their consumption, export, or sale; such as porter, British wines, spirits, vinegar, refined sugar, soap, &c. Nothing surpasses the beauty of many of the former articles; nor any thing the extent and value of the manufactories of the latter kind. A very extensive silk manufactory is carried on by the inhabitants of Spital Fields, Shoreditch, and Bethnal Green parishes; the persons employed in it amounting to about 7000. In Clerkenwell, about the same number of persons are occupied in the different branches of the watch manufactory. The coach-builders, and harness-makers, are also numerous, and have brought their respective works to such a high degree of perfection, as far to exceed, in point of elegance, those made at any other place in the world. The beaver hats made in London are all of the finest quality, and are highly esteemed both at home, and abroad. The other manufactures of London, most of which are extensive and productive of very lucrative commerce, may be enumerated as follow: copperas-works; calico-printing; distilleries, where are made

a neutral spirit from corn, besides geneva and cordials; glue manufactories; leather-dressers; iron-founderies; oil-mills, of which there is a remarkable one at Battersea; saltpetre-works; vitriol-works; dock-yards for ship-building; cooperages; turpentine manufactories; dye-houses, &c. &c.

The extent and value of the retail trade of London have been already intimated. The shops of this great city are astonishingly numerous, and there is scarcely an article known in Europe that may not be met with in one, or more, of them. London shopkeepers, when industrious, will scarcely fail of accumulating a large property, even on a small capital; yet they impose less advance on their wares, than those of any other metropolis, because the consumption is vast, the quantity of money in circulation immense, and the trader's return of capital, quick.

London is governed by a Lord Mayor,

who appears in rank and splendour above that of many European crowned heads, and by a court of 26 Aldermen, including the Lord Mayor, together with a common-council, chosen out of all the wards of the city by the inhabitants; these three constitute the executive power of this great city. There are two classes of freemen in London, who have some different privileges, that is, liverymen of the city, and those who are simply freemen. There are several companies who have no livery, and the apprentices bound to them can only be freemen of the city, and have a liberty to exercise their trade or profession within its liberties, but cannot be of the livery, nor have a vote in choosing magistrates in the city, or members to represent it in parliament, which the liverymen can. An apprenticeship of seven years entitles a youth to the freedom of the city of London. According to the census of 1821, the population amounted to 1,225,694.

National Commercial Companies in London are :

TITLES.	OFFICES.
African Company - - -	Suffolk Lane.
Bank of England - - -	Bank.
British Copper Company -	Thames Street.
Commercial Dock Company -	Fenchurch Street.
East India Company - -	India House.
East India Dock Company -	Lime Street Square.
Hudson's Bay Company -	Fenchurch Street.
London Dock Company - -	New Bank Buildings.
Russian Company - - -	Royal Exchange.
Scotch Mining Company -	Sun Fire Office, Cornhill.
South Sea Company - - -	South Sea House.
Turkey Company - - -	St. Helen's Place.

See further, title COMPANY.

Besides these which have been classed under the description of *National Commercial Companies*, there are many others for the promotion of national interests, and the pro-

tection of commerce also, but which come more properly under the notice of *private companies*; such are those for insurance, &c. as follow :

Fire-Insurance Companies.

TITLES.	OFFICES.
Albion - - - - -	Bridge Street.
Atlas - - - - -	Cheapside.
British - - - - -	Strand and Cornhill.
County - - - - -	Southampton Street, Strand.
Eagle - - - - -	Cornhill.
Globe - - - - -	Pall Mall, and Cornhill.
Hand-in-Hand - - - -	Bridge Street.
Hope - - - - -	Ludgate Hill, and Oxford Street.
Imperial - - - - -	Cornhill, and St. James's Street.
London - - - - -	Birchin Lane.
Norwich - - - - -	Birchin Lane.
Phoenix - - - - -	Lombard Street, and Charing Cross.
Royal - - - - -	Exchange, Cornhill.
Sun - - - - -	Cornhill, and Craig's Court.
Union - - - - -	Cornhill.
Westminster - - - -	Bedford Street, Covent Garden.

Life Insurance Companies.

TITLES.					OFFICES.
Amicable	-	-	-	-	Serjeant s Inn, Fleet Street.
Equitable	-	-	-	-	Bridge Street.
London	-	-	-	-	Cannon Street.
Pelican	-	-	-	-	Lombard Street.
Providential	-	-	-	-	Southampton Street, Strand.
Rock	-	-	-	-	Bridge Street.
Gas Light Company	-	-	-	-	Bridge Street.
Ditto	-	-	-	-	Dorset Street, Salisbury Square.

Lowestoff.—The principal employment of the poorer class here is the herring-fishery; upwards of 70,000 barrels of herrings have been exported hence in a season. There is also a tolerable mackarel fishery, which supplies London. Lowestoff has a manufactory of coarse china ware.

Lynn Regis.—The harbour is capable of containing 300 merchant vessels; and the advantageous situation of the town gives it a considerable traffic with all the neighbouring counties, in wine, coals, and corn, exclusive of the produce of the country; and it has some export trade to the Baltic, Spain, and Portugal. In the vicinity of Lynn there is a small manufacture of Norwich stuffs.

Macclesfield.—Numerous persons are here employed in the manufacture of buttons, silk twist, cotton goods, hats, hat-bands: on the common adjoining this town are upwards of 40 brick-kilns; the neighbourhood also produces stone and slate; at the bottom of the hills are several excellent seams of coal, which are worked to great advantage.

Maidstone.—Some Flemish refugees who settled in this place in the time of Elizabeth, established a considerable linen manufactory here, which is continued to this day; but the greatest trade of the town arises from the extensive hop plantations in the neighbourhood, and large orchards of apples, and cherries, peculiar to this part of Kent. The tide renders the river Medway navigable here, for vessels of 50 or 60 tons, by which great quantities of timber and corn are conveyed. The manufactures are linen, as before mentioned, and paper; Maidstone is also noted for its geneva.

Malden (Essex).—Vast quantities of chalk-rubbish are brought hither from the Kentish coast, for making lime, and for manure. This town has likewise a considerable trade in salt, brandy, wine, deals, iron, &c.

Manchester.—In this flourishing town 50,000 persons are employed in trade. Amongst the numerous and extensive manufactures with which it supplies most of the European markets, the most important branch is cotton, which, with the intermixture of silk, resembles the manufacture of Genoa, in various articles of foreign traffic. It is also noted for its velvets and checks, and numerous small articles, such as filleting,

tapes, laces, gartering, &c. A silk manufactory has been established here. The hatting business is carried on here and in the vicinity to a considerable extent; the hats are chiefly those called plaited hats, and ruffs, which are exported to all parts of the world, principally through the medium of the ports of London, and Liverpool. The fine hats manufactured at Manchester are not at all comparable to those of the London fabric, neither are they so highly esteemed in foreign markets. The linen manufactures of this town are in the highest repute, as are those of fustian, corduroys, nankeens, &c. Manchester may attribute the origin of its wealth and opulence to the establishment and introduction of the famous machines invented by Sir Richard Arkwright, for spinning raw cotton into the finest thread; these machines save a vast deal of manual labour, and enable the manufacturers to sell their goods at moderate prices.

The raw materials employed in the manufactures of Manchester are purchased from different countries, and consist of the following articles:—Flax from Ireland; ditto, Germany and the Baltic; ditto, Scotland; cotton wool from the West Indies; ditto, from North America; ditto, from Turkey; spun cotton, silk, wool, furs, &c.; indigo, cochineal, and other dyes; ashes, and other materials for bleaching.

The foreign trade of Manchester has been so long interrupted by extensive warfare, foreign prohibitions, and forced into such new channels by the return of peace, that it is not yet possible to calculate with any precision its exports.

Marlow, Great.—The principal manufactures here are those of black silk lace, and paper, there being several paper-mills on the river Loddon, between this town and High Wycombe. The Thames conveys hither various goods from the neighbouring towns, especially meal and malt from High Wycombe, and beech from several parts of the county of Bucks. At the Temple Mills, near this town, is an extensive manufactory of copper and brass, and a mill for expressing oil from rape and linseed.

Matlock.—In this parish nearly 500 persons of both sexes are employed in the lead works, and cotton manufactory. At Cromford, on the banks of the river Derwent,

is a cotton manufactory, established by Sir Richard Arkwright. The spars of Derbyshire here form a considerable traffic: which being turned into vases and chimney ornaments, bear a variegated polish, equal to the finest porphyry. They are much esteemed in Russia.

Middlewich. — This town (as well as most of those in this county (Cheshire), whose names terminate with *wich*) has been long noted for the great quantities of salt manufactured from the salt springs, the water of which is said to yield one-fourth of its weight in salt. A tolerable manufacture of cotton has been established here of late years.

Mitbourn Port. — About 400 persons are here employed, chiefly in the manufacture of dowlas, ticking, linsey, stockings, and shoes.

Milton Royal — has a port for barges, and is particularly noted for the produce of delicious oysters, called *Milton oysters*.

Mitcham (Surry). — Here are some mills for grinding corn, tobacco, dyers' wood, &c. as well as some bleach-fields, and there is also some calico-printing done here. About 250 acres in this parish are employed in the cultivation of medicinal plants.

Monmouth. — There is a considerable manufactory of iron and tin in this town, and many of the inhabitants derive subsistence from the preparation of bark, which is brought from the forests of Wye, and sent to Chepstow. Monmouth carries on some trade with Hereford and Bristol by the Wye.

Namptwich. — This town seems to have been considered as the chief salt-work in the time of the Romans, and is by Ravenna called *Salinis*. The salt springs are 30 miles from the sea, and lie mostly on the banks of the river Wever. Large mines of rock-salt were also discovered here in the 18th century. The salt quarries extend over several acres. Exclusively of its trade in salt, which is immense, Namptwich is no less noted for its excellent cheese; and the manufacture of shoes forms a very considerable branch of its trade for the London market.

Newark. — Here is an extensive sacking manufactory; but its chief trade is in malting. Limestone abounds within a mile of the town, particularly from an eminence called Beacon Hill; and at the depth of 20 feet from the surface is found a curious sort of alabaster, which is burned upon the brick-kilns, and afterwards ground into a fine powder, which is sent in barrels to the more distant parts as a composition for stucco-works, and ornaments for ceilings; and much used in the neighbourhood for making floors of rooms. There are seven fairs here annually, one in September entirely for cheese. A considerable trade is carried on in corn, coals, and timber.

Newbury (Berkshire). — About 2800 persons are here employed in various trades, handicrafts, and manufactures, principally in those of druggets, shalloons, and broad-cloths. Newbury has long been famed for its extensive woollen manufactures; and in the reign of Henry VIII. one John Winchcomb, better known by the name *Jack of Newbury*, kept 100 looms in his own house. This place carries on a considerable traffic in malting, by the Kennet and Avon canal, which comes from Hungerford in a line with the Kennet, and is continued to Alderman's wharf, where the river becomes navigable, and communicates with the Thames at Reading.

Newcastle-upon-Tyne. — This place has long been noted for its glass-works, particularly those of the finer sort; also, several soap-works, and some grindstone manufactories. In the coal trade, it is the first port in the world, and has sometimes exported to foreign parts, and coastwise, upwards of 600,000 chaldrons in a year. The river Tyne is here so shallow, that few ships of any burthen can come up to the town; the large colliers are therefore compelled to be stationed below, at Shields, where they take in their lading, at an increased expense, for the metropolis, and other parts of the kingdom. Newcastle has for centuries supplied London and most of the southern counties with coals; and the quantity sent to the former is computed to amount annually to no less than 400,000 chaldrons! The boats destined to convey the coals from Newcastle to Shields, by the river Tyne, are called *keels*; they are measured each year, and are never suffered to contain more than eight chaldrons, Newcastle measure. The number of these boats, thus employed, is upwards of 400; and this species of navigation alone gives employment to 2,600 mariners. Every chaldron of coals sent from Newcastle, for any part of England, pays a duty of one shilling, which was settled by king Charles II. on his natural son, the Duke of Richmond. The pyrites found in the coal-mines in this neighbourhood are sold to the proprietors of the copperas-works, at the rate of 8*l.* per keel. The copperas or green vitriol obtained from those stones, is superior to that made in France and Germany; and, some years ago, large quantities of it were bought up by the Dutch. The vessels which carry the coals to London are sometimes laden in return with chalk, but most frequently go back in ballast. Of the chalk, the inhabitants make what is called Spanish white for painters' use, &c. At the distance of a mile and a half, from Newcastle, is a white-lead manufactory, where lead-ore, drawn from the mines of Cumberland, is melted. The litharge, which proceeds from the ore when melted, is of great service to

the glass-blowers, who use it for the purpose of assisting the fusion of the other substances employed by them. There are some foundries in the town, where iron is cast into various forms, and for different purposes; such as the sheathing of carriage-wheels, pots, bodies of pumps, cylinders, kettles, &c. &c. Some very excellent steel is made at Newcastle, and in its vicinity; and the manufacture of earthen-ware, long established here, has of late greatly increased, some of the potteries having upwards of 100 persons constantly employed. Newcastle exports large quantities of lead, salmon, butter, tallow, and grindstones. Ships are sent hence to the Greenland fishery.

Newcastle-under-Lyne.—In the neighbourhood of this populous town, are many coal-pits, the coal of which is much softer than the cannel coal, and is cut in slices; but consumes so fast, that it is only fit for forges. There is a greater quantity of stoneware made at the potteries near this place, than in any other part of England, 100,000*l.* worth having been sometimes exported in a year. The argillaceous earth used by the potters is of two sorts, and is brought from Devonshire, which county, it is said, is capable of supplying all the potters in the kingdom with this valuable material. The silex, of which the potters make great use, is brought from Gravesend. The clothing trade flourishes here; but the chief manufacture is that of coarse or felt hats, under an incorporated company of felt-makers; of which kind of hats, immense quantities are exported to the West Indies, for the use of the negroes.

Newport Pagnell.—This town being surrounded with excellent corn and pasture land, all kinds of grain are produced here. The manufacture of bone thread lace, carried on in the town and neighbourhood, as well as that of paper, form the chief branches of employment.

Northampton—has some capital manufactures of shoes, stockings, and lace; of these, great quantities are sent to the metropolis, as well as exported. Saddles and harness, of every description, are likewise made here, both for home use, and exportation. There are two annual horse-fairs at Northampton, much resorted to.

Northwich.—The inhabitants of this place are chiefly employed in the manufacture of cotton, and in the salt-works. On the south side of the town are mines of rock-salt, dug to a great depth, and extending over several acres. The salt which these mines yield is dissolved, clarified, and made into culinary salt. At the brink of the river Dan are several brine-pits. Much of the salt is carried to Liverpool, whence it is exported.

Norwich.—The manufactures of this flourishing city are principally those of woollen stuffs, which Mr. Blomefield, in his "Essay

towards a Topographical History of Norfolk," seems to imagine were first introduced by the Flemings, so early as the reign of Henry I. It appears that the manufactures, after some time, fell to decay; when, in 1365, the city invited a number of manufacturers from the Low Countries, of whom about 1000 came over, when they set up the making of bayes, sayes, arras, &c. and various works mingled with silk, and linen yarn; and, in 1575, they first made bombazines. Of late years, damasks, camlets, and crapes, have been made here; but, during the late war, the trade of Norwich has declined, in some measure, owing to the restricted intercourse with foreign countries, and the great rivalry of the cotton manufactures. The manufacturing trade is confined to the city itself; but the operation of spinning, and preparing the wool, employ the poor of most of the small towns and villages in the county of Norfolk. The shawls made at Norwich, denominated *Norwich shawls*, are composed of wool, and silk, and are in great repute, not only at home, but in foreign countries. Norwich carries on a considerable trade with Yarmouth, whither its manufactures are conveyed by the river Yare, and thence shipped for Holland, Germany, Sweden, Norway, and other northern countries. The wools chiefly used in the Norwich manufactures, are those of the finest fabricks. According to a calculation of Arthur Young, made some years ago, the trade of Norwich, in woollen stuffs, was considerably more than a million sterling. India is the chief market for them; but South America, where light woollen goods are in great request, presents the prospect of one little inferior.

There are some salt springs near this city, which yield six ounces of salt per lb. avoirdupois. There are eight wardens of weavers chosen annually, and sworn to take care that there are no frauds committed in spinning, weaving, or dyeing stuffs.

Nottingham—has 40,000 inhabitants, of whom above 11,000 are employed in manufactures in this great trading town. It is the principal seat of the stocking manufacture, chiefly of the finer kinds of silk, and cotton; the cotton for which is spun by machinery, worked by water. This town has a considerable export trade to the continent of America, and the West Indies. It has also a good traffic in earthen-ware; and its malt is supposed to be as well prepared as that of any other part of the kingdom. The ale of Nottingham has long been celebrated. The tanning business, for which this town was once noted, is now gone to decay, but the manufacture of frame-work lace rivals that of the whole kingdom.

Ormskirk.—This town possesses a good trade, particularly from its connection with

the inland navigation. Here are spun large quantities of cotton and thread. It is famous for its medicine to cure the bite of mad dogs, but which has, of late, lost much of its former celebrity.

Padstow.—At the mouth of the river Camel is a convenient harbour for vessels of 500 tons burthen at high water, but it is rather difficult of access, having rocks on the east side, and a bar of sand on the west. Padstow has a tolerably good trade to London, and exports great quantities of slate. It has also a small fishery for herrings.

Penryn.—The greater part of the male inhabitants of this place are employed in the pilchard and Newfoundland fisheries. Here are four grist-mills, and a paper-mill; besides several good breweries, which supply the shipping at Falmouth. Penryn is reckoned the granary of the south-western part of Cornwall, having considerable warehouses, generally well stocked with flour and grain, from the Isle of Wight, and Hampshire.

Penzance.—carries on a tolerably good trade in the pilchard fishery. Several ships belong to this port, although the harbour will not admit large vessels. The surrounding country abounds in metallic ore, and it is said that the veins of lead, copper, and tin may be discovered in the sea at low water. The different tin-mines furnish a considerable traffic and employment here; that called the Wherry Mine, is 30 fathoms deep. This is one of the tin coinage towns.

Peterborough.—The trade here in corn and timber is very considerable; and the stocking manufacture is carried on to great extent. The river Neu, on which this little city is seated, is navigable for barges; and about 4000 quarters of malt are annually sent, by vessels of this description, to different parts of the kingdom.

Plymouth.—Upwards of 7300 hands are here employed in various trades, manufactures, and handicrafts. This is one of the most considerable sea-ports of the kingdom. Here is a custom-house, and hence a considerable traffic is carried on with the West Indies. The fishery for pilchards extends no further east than this port, from which great quantities are exported to Italy, and other countries. In the range of buildings here, called the Victualling-office, are two bake-houses, each containing four ovens, that in one day can bake a sufficient quantity of bread for 16,000 men. That part of Plymouth called the Dock, which lies about a mile and a half from the town, was first designed as a wet and dry dock, in the reign of William III. and to which two others have since been added, with all the conveniences necessary for building and repairing ships of war; the docks being dug out of a mine of slate, and lined with Portland stone. Near the docks

are erected ranges of store-houses for the arms, rigging, sails, &c. The manufactories of Plymouth consist of rope-works, anchor-foundries, ship-yards, and every other object of industry connected with the providing of naval stores.

Ponty-Pool.—This place has long been noted for its manufacture of japanned ware, to which it gives name; but it is now considerably on the decline, owing to the rivalry of Birmingham. Immense quantities of coal, and iron ore, are found in the vicinity. A canal of recent formation, connects this place with Newport.

Pool (Dorsetshire).—This town was formerly much resorted to by foreign merchants, particularly those of Spain. The chief traffic here, at present, is in the Newfoundland fishery, which proves an excellent nursery for the navy. The exports in provisions, nets, cordage, sail-cloth, and wearing apparel, for the consumption of the planters and servants, are very great. The imports are cod, salmon-oil, seal-skins, furs, &c. There are constantly employed about 250 sail of shipping, belonging to this port, with 1500 hands; of which about 140 are in foreign trade, and the remainder coastwise. Very large oysters are taken here, in some of which, it is said, pearls have been found. This fish is usually pickled, and sent in small kegs to the metropolis: vast quantities, in this state, used to be exported for Spain and Italy; a great deal is still shipped for the West Indies. The harbour is reckoned the best and safest in the Channel, as the ground is every where soft, and water sufficient at spring tides for vessels of 16 feet draught to come up to the quay. On the Ham side of the harbour there are quays to careen ships, to throw out and take in ballast, with several slips for building. Here is a custom-house. In the neighbourhood are some extensive salt-pans, where salt is made from sea-water.

Portland.—This peninsula affords excellent stone, used in most of the modern magnificent buildings of the country; it was first brought into repute in the reign of James I.

Portsmouth.—About 3000 persons are constantly employed in the dock-yards at this place. The dock-yard containing the warehouses for keeping all kinds of military and naval stores, is the most complete in the world; and possesses all the various manufactures necessary for supplying its different naval equipments. The docks and yards resemble a distinct town, there being particular rows of dwellings, built at the public expense, for all the principal officers, who are under a separate government from the garrison. The principal machinery of the yards, particularly that of making blocks, consists of steam-engines on a very extensive plan. In the yard some hundreds

of convicts are daily brought from the hulks in Langston harbour, and employed in many useful branches of rigging, &c. Portsmouth has some foreign trade, and its coasting trade is very considerable.

Prescott. — This town has long been celebrated for the making of watch-movements, pinion-wire, small files, coarse earthen-ware, and for the various cotton branches. In the vicinity are many coal-mines.

Preston (Lancashire). — Nearly 1500 persons, of both sexes, are here employed in the cotton manufacture, which is carried on very extensively. The chief manufactory is so extensive as to present rather the appearance of a town than that of a manufactory. Steam-engines are in general use. The muslin made here is in high repute. The river Ribble is only navigable for small vessels, which come coastwise from Liverpool, and other parts; but, by canal navigation, Preston has communication with most of the principal rivers in England.

Reading. — Great quantities of corn, flour, malt, and timber, are conveyed hence to London, by barges. Its manufactures are sackings, sail-cloth, blankets, ribbons, and pins. Its trade in flour especially is prodigious, and the population much on the increase.

Retford, East. — The environs of this town abound in hop-plantations, and it has a celebrated fair for that article in September.

Richmond (Yorkshire). — This place has a good trade in yarn stockings, and seamen's woollen caps. There are excellent lead and coal mines in the vicinity.

Ringwood — has long been celebrated for the excellence of its ale, which it exports: it also trades in leather, stockings, druggets, and some narrow cloths.

Rochdale. — The chief manufactures here are those of woollens, cottons, and coarse hats. The woollen goods made here consist of baizes, linsey-woolsey, serges, &c. The hills in the vicinity abound with excellent coal.

Rochester — has a considerable oyster-fishery on the Medway; and there is a large manufactory for cordage in the city.

Ramsey, or Rumsey. — The principal trade of this town is in the manufacture of sackings, of shalloons, and paper; and it has long been noted for the excellence of its ale.

Rotherham. — Upwards of 1000 persons are here employed in the manufactures of iron and steel, and in a very extensive brewery; and in the immediate vicinity are mines of coal, and iron ore, of immense magnitude and value.

Rotherhithe. — The inhabitants of this place are principally employed in boat-building, in the trade of ship-chandlery, and in the various avocations attendant on the navigation of the river Thames.

Saffron-Walden. — A considerable traffic is carried on in malting; but its fame arises from the immense quantity of saffron grown and prepared here, from which it obtained its appellation.

Salisbury. — This city has a considerable manufacture of flannels, and the cloths called Salisbury whites; and an extensive traffic in bone-lace, and cutlery. Druggets and Spanish cloths are, likewise, made here; and the place has, for many years, been in an extremely flourishing condition, owing to its inland navigation, and its well-attended fairs.

Sandwich — one of the Cinque-ports. Here was the staple for wool, removed from Queenborough in the reign of Richard II.; and in the time of Queen Elizabeth, some Flemings set up a manufactory of woollen cloths; but its chief trade now is in malting.

Scarborough — has a very commodious quay, and one of the best harbours in the kingdom; and has, likewise, a number of vessels employed in the coal trade, from Newcastle to London. Corn, dried fish, and other articles, are sent coastwise; and the fisheries for cod, ling, soles, haddocks, herrings, &c. employ many hands. There is, also, a manufactory of sail-cloth, rope-walks, and several ship-yards, in which vessels of 600 tons are built.

Sheerness. — About 1400 persons are variously employed in the royal dock-yard at this place. Here is an ordnance-office, with apartments for the different officers, all ordnance stores being delivered here to the fleet lying at the Nore: here is also a yard, and a dock, intended chiefly for repairing ships that may meet with any sudden accident.

Sheffield. — Above 10,000 persons, of both sexes, are here employed in trade and manufacture, particularly in all kinds of hardware; for which this populous town is celebrated throughout Europe. Sheffield has long been noted for its manufacture of cutlery, there being constantly employed about 600 master-cutlers; and from the convenience of the two rivers, Don and Sheaf, and adjoining coal-mines, the whole of the heavy work has, of late years, been performed by mechanism. Among the curious machines used here may be particularized, the large iron hammers, or mallets, weighing several hundred weight, which, being worked by water, beat large pieces of iron, not only into bars, but nearly to the size of a thin rod or wire, without any manual exertion, except what is required in placing and holding the pieces of metal beneath those immense hammers. The cutlery of Sheffield consists of all kinds of knives, razors, scissars, sword-blades, &c. every species of carpenters' edge-tools, besides scythes, sickles, &c. Near that part of the town called the rock of Gibraltar, is a large

cannon foundery, in which immense pieces of iron ordnance, of the very best quality, are cast. The plated-ware made at Sheffield is in far greater estimation than that of Birmingham; and the late addition of solid silver edges to the plated articles renders them nearly, if not quite, as durable as those made wholly of silver. This branch of manufacture includes side-board services, such as salvers, cups, candlesticks, branches, handles for knives, salt-cellar, &c. &c. as well as mountings for harness and carriages, door-plates, ornaments and securities for portable desks, covers for ink-stands, &c. &c.

Plated and gilt buttons, made in this town, are bought up with avidity by the London dealers, who sell them in the metropolis under the hacknied appellation of *town-made*, though, in point of fact, it is scarcely possible that the button-platers, or gilders, of London can excel those of Sheffield. There is a silk-mill, on the model of that erected at Derby, here, in which, for the most part, women and children are employed. The silks wrought here are those of Bengal, China, Turkey, and America. In the town and its environs, large quantities of iron are converted into steel; and, at one extremity of the place, a considerable white-lead manufactory has been established for some years past. The vinegar employed in this business is made upon the spot. The files made at Sheffield have long been in the highest repute; the steel of which they are formed is commonly used in the state in which it comes from the hammer. At a short distance from Sheffield there are coal-mines, which yield abundance of fuel, much of the same kind as the Newcastle coal, though less bituminous, and therefore best adapted to manufacturing purposes.

Shepton Mallet. — Nearly 4400 persons are here employed in various kinds of woollen manufacture, in which this town carries on a great trade, as well as in knit stockings.

Sherborne (Dorsetshire). — This town has two silk-mills, besides manufactures of linen and woollen-cloth, all of which employ upwards of 1100 hands.

Shields, North. — The trade of this place may be said to vie even with that of Newcastle, upwards of 400 vessels, chiefly colliers, loading here annually.

Shields, South. — This place, like the foregoing, enjoys all the advantages of trade and commerce in common with Newcastle, particularly in the coal trade, some of the largest colliers taking in their loading here. A great number of trading vessels are built here. South Shields was noted for its extensive salt-works, upwards of 200 pans being formerly employed. There are several glass-works.

Shoreham, New. — This sea-port has a considerable traffic, and a custom-house, with a collector, comptroller, and inferior

officers. Shoreham has a good trade in ship-building, and is celebrated for the excellence of its oysters.

Shrewsbury. — About 6000 persons, of both sexes, are here employed in various trades and manufactures, principally in that of flannels, generally denominated *Welsh flannels*. There are twelve trading companies, all incorporated in charters, in the same manner as in London. The staple trade of Shrewsbury is in flannels and Welsh webs. The flannels are bought at Welshpool, in a market holden for that purpose, most of which are made in Montgomeryshire, though some are made, and more spun, in the neighbouring parts of Shropshire. The flannels in Pool market are in pieces of 100 yards long on an average, and they are chiefly resold to the London merchants, who are the exporters. The webs are fabricated in Merionethshire and Denbighshire, and brought to Shrewsbury, where they are sold in a hall, which none but the members of the Drapers' company can enter; but, of late years, much of this market has been anticipated by buyers in the country, which often obliged the Shrewsbury drapers to send thither themselves. Webs are about 200 yards long. Those made in Merionethshire are about 7-8ths of a yard wide, and are called *high or strong country cloth*; those made in Denbighshire are called *small or low country cloth*; the former, after they are bought by the drapers, have the wool shorn by men, called Shrewsbury shearmen; or they are sent to the fulling-mill to be thickened, and are then exported, in bales of different sizes, some containing even 2000 yards. The ultimate markets are Germany, Holland, and America. The manufacture in Wales, by means of jennies introduced into farms, and other private houses, is four times as great as it was 30 years ago. A large mill for the purpose of fulling, spinning, &c. was erected about five miles from Shrewsbury; there are, also, houses for dyeing woollen cloth in the county. A large manufactory of coarse linens, more especially of linen thread, has been established in its environs. It also boasts a brewery, a starch manufactory, and an iron foundery. This town is also famous for the excellence of its brawn, (which is sent to most parts of the kingdom;) as it has for many years been noted for its delicate cakes.

Skipton. — The trade of this place has much increased of late years, from the advantage of the Leeds and Liverpool canal running near it; it has a paper-mill, a glazing-mill, and one for the silken twist. In the neighbourhood are extensive cotton-works.

Southampton. — The inhabitants of this town carry on a considerable trade with Portugal for wine and fruit, as likewise with the islands of Guernsey and Jersey. The

port wine imported here is generally of the lighter kind, approaching, in flavour and body, to the fine claret shipped from Bourdeaux, and hence light-bodied port obtained the appellation of *Southampton port* among the wine-dealers. The manufactures here are principally those of silks, and carpets. Near the town is a wood-mill, where ships' blocks are cut, and whence the king's yards are, in some measure, supplied.

Southwark. — The manufactures here are as numerous as, and nearly similar to, those of London. The hatting-business, particularly in the neighbourhood of Tooley-street and Gravel-lane, in the finer branches of the manufacture, is carried on to a great extent, and employs several hundred hands. Here are, likewise, considerable oil-mills, saltpetre manufactories, soap-works, glue manufactories, besides the warehouses of numerous hop-factors, cheesemongers, and, in short, traders of every description. The wharfs on the Southwark side of the Thames are frequented by coasting vessels from almost every port in the kingdom; and at these wharfs, likewise, a great deal of business is done in the Irish provision line. See *London*.

Stafford. — Upwards of 5000 persons are here employed in various trades. This town has a considerable traffic by means of its canal communicating with all the neighbouring counties. Its chief manufactures are cloth, shoes, and boots. Of the two latter articles, large quantities are sent to the metropolis, to Birmingham, Manchester, and the adjacent towns; and much of them exported to foreign parts. The boots and shoes are, generally speaking, neatly made, but they are not considered so durable as those made in London, or in Scotland. The potteries in the vicinity are noted for their productions; and immense quantities of their ware have been exported to Holland, Germany, Spain, Russia, America, and even to France.

Stalbridge. — Most of the inhabitants of this place are employed in the stocking manufacture, for which the town has been long noted. Great quantities of excellent stone are dug in the neighbourhood.

Stilton. — This village has long been celebrated for the excellence of its cheese; the consumption of which is particularly great in the metropolis. It acquired its celebrity from the article being first sold to travellers at a large inn here, for it is all made at a distance from the place, even in another county.

Stockport. — The population, trade, and manufactures of Stockport, particularly that of cotton, have amazingly increased of late, and trade derives considerable benefit from the canal communication with the Mersey, Dee, Ribble, Severn, Trent, &c. The printed cottons manufactured here are held in the

highest esteem both at home, and abroad; and the fustians, dimities, muslins, &c. are in no wise inferior to those of Manchester. Here are, likewise, silk-mills, whose extent and importance are daily increasing. Some fine beaver hats are made in this town, but the number of plated hats is far beyond that of the former. Of the latter, great quantities are sent by land-carriage to London and Liverpool, whence they are exported for foreign parts.

Stockton-upon-Tees. — Here are several manufactures of check, huckaback, damasks, sail-cloth, and ropes; and several vessels, from 40 to 400 tons, are annually built here.

Stourbridge. — This place has long been noted for its manufactory of crucibles, from the peculiar quality of the clay found in the neighbourhood. The iron and glass works, in this town and its vicinity, are much celebrated for the excellence of their different productions. Green bottles, decanters, window-glass, drinking-glasses, chandeliers, chimney-ornaments, plate-glass, &c. &c. are blown and cut in the first style of excellence and elegance. Here is, likewise, a considerable manufacture of frieze. Stourbridge annual fair is celebrated for an excellent show of horses, and for good cheeses.

Stroud. — Upwards of 5700 persons are here employed in trade and manufacture, particularly in the clothing branch, being long celebrated for the excellence of its scarlet, attributed to the quality of Stroud water, and not, as it ought to be, to the ingenuity of the dyers: on the banks of the river are several fulling-mills.

Sunderland (Durham). — It appears from the returns made to the House of Commons that 1451 persons were employed in trade, exclusive of 322 keel-men, or persons employed in navigating the keels (see *Newcastle-upon-Tyne*), and 1249 seamen belonging to the port in the coal-trade. The traffic which this place carries on in coal is, as will be perceived from the foregoing statement of the hands employed, of very great importance. With this necessary article of fuel, Sunderland supplies many parts of England; but Dublin, and some other Irish ports, take off the largest quantities, which are chiefly employed in the sister kingdom in forges and other manufactories. This place has been greatly enriched by the coal trade, and the salt-pans erected here; there are, also, two glass-houses, several small dock-yards, several potteries, and two or more copperas-works. Sunderland exports lime, grindstones, and such like commodities.

Swansea. — The trade of this town has been much improved by its canal; there are two extensive breweries, a pottery upon Mr. Wedgwood's plan, an iron-foundry, two roperies, and a good dry-dock, employing a number of hands; it has a considerable

commerce in the export of coal, stone, iron-ore, and lime-stone, all found on the banks of the river Towy. There are seven large copper-works at some distance from the town, smelting annually 45,000 tons of metal, and consuming 70,000 chaldrons of coals. Vast quantities of lead-ore are, likewise, smelted in this town and its vicinity; and recently some potter's clay has been discovered of which porcelain is made, which is said to excel, in transparency and beauty, any that is produced in the world.

Taunton.—has a considerable manufacture of silks, serges, duroys, druggets, &c. and a good trade to Bridgewater by the river Tone. A superior kind of ale is sent hence to Bristol for exportation.

Tewkesbury.—Upwards of 1300 persons are here employed in trade and manufacture, principally those of stocking-knitting, framework, and the manufacture of mustard and malt.

Thetford (Norfolk).—This town has a considerable manufacture of woollen-cloth and paper, and a trade to Lynn by the navigation of the river Ouse.

Tiverton.—The chief manufactures are those of serges, kerseys, druggets, and diapers, for which this town has been long famous.

Topsham.—This is considered as the port of Exeter, where all the large vessels lie, and receive and discharge their lading; and here the captains, shipwrights, and officers of the customs and excise reside.

Trowbridge.—This place has some considerable manufactures of superfine broad-cloth and kerseymeres, principally wrought by machinery.

Truro.—has a convenient harbour for small vessels. The principal traffic of the place is exporting the ore dug from the neighbouring tin and copper mines.

Tunbridge Wells.—The principal trade here is that of the manufacture and sale of toys, made of cherry-tree, sycamore, &c. and the Tunbridge turnery-ware finds a considerable mart in most parts of the kingdom.

Ulverstone.—By means of a canal, lately cut, vessels of 150 tons can approach the town, carrying on a considerable traffic in the export of the iron-ore, lime-stone, and corn, as well as in blue slate of an excellent quality. In the neighbourhood are several furnaces and smelting-houses.

Uttoxeter.—This town has manufactures of ironmongery in every branch, the town being nearly surrounded with extensive forges. It carries on a considerable traffic by its navigation communicating with the Trent, Thames, Avon, &c.

Wakefield.—This town has long been noted for the first wool market in the kingdom, as well as for its manufactures of woollen-cloths and stuffs, and of late years

this branch has considerably increased. The woollen-cloths consist chiefly of plain white broad-cloths, tammies, serges, dozens, everlastingings, besides superfine, and coarse, coatings. It has been customary with many of the Yorkshire clothiers, for some years past, to send their cloths hither to be dyed. The wool used here is principally the produce of Leicestershire, mixed with some of the wools of the northern counties. The numerous manufactories at Wakefield, and in the neighbourhood, principally supply the market at Leeds, and Huddersfield. A hall, 70 yards long, and 10 broad, consisting of two stories, has been erected for the sale of stuffs. Down the centre of each floor is a row of stands, facing outwards, for exhibiting the various goods for sale, and the commencement of the market is announced by the ringing of a bell over the hall, similar to the cloth-hall at Leeds. This town has a navigation to Huddersfield by a canal, and to Leeds by the Calder. In the environs of the town are very productive coal-mines.

Walsall.—Upwards of 5400 persons are here employed in trade and manufactures, chiefly in those of buckles, bridle-bits, and various articles of hardware. Vast quantities of nails are made here, of which the greater part is sent to Birmingham and Wolverhampton. Clock-dials and iron-trays are japanned and painted in Walsall and its vicinity.

Walton-le-Soken.—This place has long been noted for its extensive copperas-works. Walton, as well as Kirby and Thorpe-le-Soken, were so called from their peculiar privileges, originally granted to French refugees, who established themselves here, and introduced several manufactures of cloth, &c. from the Netherlands.

Wandsworth.—The chief manufactories here are calico-printing, bolting-cloths for flour-mills, fine beaver hats, distilleries, an oil-mill, vinegar-works, and iron and white-lead-mills.

Wapping.—The population here consists mostly of those attendant on the shipping of the port of London; such as slop-sellers, ship-carpenters, sail-makers, ship-chandlers, &c. The new docks formed here have been a great improvement in the angle formed by the Thames; the one, called St. George's dock, capable of holding 200 sail of shipping, with sufficient shifting-room; and the other adjoining, called Shadwell-dock, capable of holding 50 sail. At the eastern extremity of the docks are stupendous ware-houses, belonging to the Custom-house of London, although rented of the Dock Company for warehousing tobacco, and the cellars thereof are appropriated to housing of wines; there are likewise ranges of ware-houses for housing merchandise in general.

Wareham. — The chief traffic here is the digging of pipe-clay in the neighbourhood, and sending it coastwise; of this clay nearly 10,000 tons are annually exported to London, Liverpool, &c. Here is a good salmon-fishery.

Warrington. — The chief manufactures of this place consist of sail-cloth, canvas, fustian, pins, and glass. Besides its manufactures of huckabacks and coarse cloths, Warrington has long been noted for the excellence of its malt, in which it carries on a considerable traffic. Here is also a gunpowder-mill.

Watford. — The Colne, which nearly surrounds this town, has several mills on its banks; but its principal manufacture here is the throwing of silk by extensive machinery.

Wednesbury. — The manufactures here are all kinds of edge-tools, nails, coach-springs, bridle-bits, stirrups, &c. Here are several iron forges, in one of which the iron is melted from the ore. This place is reckoned famous for its coal, much esteemed for smiths' work, on account of its extreme heat. Besides the different cast, and wrought, iron manufactures, enamel-painting is done in the highest perfection and beauty here.

Whitby (Yorkshire). — This is a considerable town, and carries on a great trade in coals; there are also several alum-works, which employ a number of hands, and it has an important share in the export of provisions, tallow, &c. Many ships of good burthen are built here, and hence some are annually sent to the Greenland fishery.

Whitehaven. — It appears from the returns made to the House of Commons, that 1050 persons are here employed in various trades. The coal mines are the source of the prosperity and wealth of this place; they extend 130 fathoms deep, and in many places a considerable way under the sea. The greatest part of the produce of these mines is exported to Dublin, and other Irish ports, where it is principally consumed by private families; being nearly equal to the coal of Newcastle. Here are six yards for ship-building, extensive manufactures of sail-cloth, large roperies, several public breweries, and important copperas-works.

Wigan — is noted for its manufactures of linen, cotton, and strong checks; also for braziers and a pottery, which furnishes fine earthen-ware. In the vicinity is found, in great plenty and perfection, that species of highly inflammable and strongly bituminous coal, denominated *cannel*; it is so soft, prior to being exposed to the action of the air, that it may be easily moulded into any shape, and it is frequently made into snuff-boxes, ink-bottles, and a vast variety of toys and utensils. The collieries adjacent to Wigan furnish many parts of England and

Ireland with the article of fuel, and coals are exported hence to the continent.

Wilton — is famous for the manufacture of a peculiarly elegant and fine species of carpet, to which it gives name, and for that of thin woollen-stuffs. The number of hands employed in these manufactures amounts to more than 1500.

Wirksworth. — About 2000 persons are employed here in the avocations attendant on the lead-mines in this neighbourhood. Lead-ore is found here under four denominations; the largest size is called *bing*; the next size, *pesey*; the third is passed through a sieve in washing, and is called *smitham*; and the fourth, which is caught by a slow stream of water, is termed *belcand*, and is as fine as flour, and the most inferior in quality. All the ore, as it comes from the mine, is beaten into pieces, and washed by women. The lead is then melted in furnaces, and poured into moulds of various sizes. There are many laws and regulations for the mines here, the district being under a steward and bar-master. Mill, and grind, stones are found in the vicinity, as well as veins of antimony.

Witney — has been long famous for its manufacture of blankets, which employs a great number of hands. In the reign of Queen Anne the blanket-weavers were incorporated, under the style of the master, assistants, wardens, and commonalty of the blanket-weavers of Witney: they have their hall, in which they regulate all matters respecting the measure, mark, and quality of their staple commodity. Here likewise are manufactured thick woollens, called bearskins, and kerseys.

Wiveliscombe. — More than 1500 persons are here employed principally in the manufacture of woollen goods, such as shrouds, blanketing, kerseys, and baize.

Wivenhoe. — This town has a tolerably good coasting-trade. Here the Colchester oysters are chiefly barrelled and sent to the London market.

Wolverhampton. — A large and populous town, situate in a parish of 30 miles in circumference, with 30,000 inhabitants. This place produces hardware of every kind, but is pre-eminent above all other places for the manufacture of locks on the most intricate construction. Most of the farmers in the neighbourhood have their forges, where they work when not employed in the field, and take their work to market, as regularly, as other farmers do their corn; whence it is bought up for various parts, and finds a ready market in most parts of Europe. Many of the women are employed upon these manufactures, and work at the file. The chief articles made in Wolverhampton and its vicinity are, all kinds of coarse heavy iron-work, such as ploughshares, locks, hinges, nails, bolts, fire-irons, spades,

shovels, staples, hooks, screws, scythes, sickles, &c. besides japanned wares, such as trays, clock and watch-dials, snuff-boxes, bread-baskets, &c. &c.

Woodstock — is particularly known for its manufacture of fine wash leather-gloves, and steel watch-chains, &c.

Woolpit. — Here is made a species of white brick, similar to the Flanders-brick : it is much esteemed.

Woolwich. — This place is celebrated for being the most ancient military, and naval, arsenal in England, and it has a royal dock-yard. It is recorded in history that men of war were made here as early as the reign of Henry VIII. The whole of the works at this place are encompassed with high walls. The ropery here is very extensive, where the larger cables are made for the men of war. In the park or gun-yard is a repository of cannon of all sizes and dimensions, having upwards of 8000 pieces laid up at one time. In the warren the artillery is all cast, and proved. Here is also a laboratory, where the mattresses are employed in making cartridges, charging bombs, &c. for public service. The royal dock-yard contains two dry-docks, three mast-ponds, a smith's shop, with several forges for making anchors, extensive storehouses, a mould-loft, sheds, workshops, &c. It employs upwards of 1000 persons, and first-rate men of war are frequently built in this yard. The rope-walk for making large cables is a quarter of a mile in length.

Worcester. — The principal manufactures here are those of china, and carpets. The china-ware made in this city is beautiful beyond description, exceeding in colour, and decoration, the finest production of the French manufactories. The quantities of china-ware exported from Worcester to the Continent of Europe, the East Indies, and America, are almost beyond calculation. The services vary in price from five guineas to five hundred. The carpet manufacture excels also in similar qualities ; viz. colours, and beauties of design. The texture and appearance of the best, resemble true tapestry more than any others made in England. Worcester has a considerable manufacture of gloves ; and a large market for hops is holden in the city. Cider is likewise an article of traffic here.

Workington. — The inhabitants of this town are principally employed in the salt-works, salmon-fishery, and coal-trade, there being upwards of 100 vessels engaged in the latter, to, and from, this port. The coal is chiefly sent to Ireland. Sail-cloth and cordage are manufactured here.

Worsted. — This place is remarkable for having the first introduction of the manufactory of twisted yarn, called *worsted*. It has now a small manufacture of stockings and stuffs.

Wresham — is a grand mart for flannel, and the manufacture of this article is the chief employment of the neighbouring poor in the environs.

Wrinton. — It is here that teasels or thistles, sold to the cloth-manufacturers for the dressing of woollen-cloth, are grown.

Yarmouth, Great. — The situation of this town is very favourable to commerce, and there are many ships belonging to this port in the foreign trade ; but the most considerable employment here is in the fishery, there being 60,000 barrels of herrings generally taken and cured here within the year. The season commences at Michaelmas, and lasts all October. The greater part of these herrings are exported from London and Yarmouth for Italy, Spain, Portugal, and the West Indies. In the northern seas the Yarmouth fishermen catch immense quantities of what is called *North Sea cod*. From Norway and the Baltic, Yarmouth imports deals, oak, pitch, tar, hemp, canvas, sail-cloth, &c. which are used in the construction of vessels, of which several are annually built in this port. Yarmouth exports much grain to Holland, as also the cloths of Leeds, Wakefield, Halifax, and other towns of the West Riding of Yorkshire, besides lead, smelted in the midland, and northern, counties, to Holland, Bremen, Hamburg, &c.

York. — This is not a very trading place. Vessels of 70 tons can come up the Ouse, on which this city is seated, and thus York has a tolerable coasting-trade. At one period, clothing to an immense amount, the produce of the county, was shipped hence for the use of the Dutch, Flemish and German troops ; and at this time Russia clothes her army with the produce of the county, shipped from here and other ports of it.

We have now concluded our promised catalogue of the chief commercial cities and towns of England, and of the few in the principality of Wales which stand particularly pre-eminent. Of others in the last-mentioned part of the island, it is only necessary to add, that large quantities of flannel are manufactured in most of the towns and hamlets of South Wales, and are, for the most part, sent to the market of Shrewsbury for sale. There are many copper, iron, and lead-mines and works, both in North, and South, Wales, besides vast quarries of slate. The produce of these mines, works, and quarries, gives rise to a considerable coasting-trade, and abundance of slate, in particular, is exported to Ireland.

Although perhaps unnecessary for information, for uniformity's sake we must observe, that accounts are kept in pounds sterling, that each pound consists of 20 shillings, and each shilling of 12 pence.

FRANCE, even since the dismemberment of some of its possessions, as well in the

Netherlands, as in the East, and West, Indies, is both extensive and powerful. The productions of France are various, and plentiful, and many of them of great commercial importance; these we shall enumerate, classing each of them under a distinct head, in order to convey that information, with regard to the extensive traffic of this country, which is absolutely necessary.

Grain—of every kind, but especially wheat, forms one of the chief riches derived from the soil. The other sorts of grain produced in France are, rice, barley, rye, oats, &c. Potatoes may be classed under this head; a vast quantity of a tolerably good quality are grown in the provinces of Poitou, Normandy, Limosin, Gatinais, and the Isle of France.

Wines.—Burgundy, which by many is accounted the choicest of French wines, is of a lively red colour, and possesses an agreeable flavour: the best is made in Baom, Nuits, Romanée, Premeau, and Vougeot. The wines of Beaujolais keep extremely well; much of them are sold under the name of Mâcon. The wines of Anjou and Orleanais are thick and heady. Auvernat, commonly called Casse Telle, is made at Orleans, and is a full, good wine. Another Orleans *white* wine in Genetin. At Epernay, in Champagne, two-thirds of the surrounding country, such as Ay, Cumières, Pierry, Disy, Haut Villiers, &c. are laid out in vineyards, where the celebrated wine called Champagne is made. Poitou produces a tolerably good white, which resembles Rhenish. The wines of Haute Guyenne and of Gascony, under the names of claret, and Bourdeaux wines, are much esteemed; they are distinguished by dealers under the general titles of Medoc, Haut brion, de Saint Emilion, de Grave, &c. The best Medoc wines are, Lasitte, Latour, and Margaux; those of *Vins de Grave* are Haut brion, Haut Talence, Merignac, Pessac, Laugon, Villenave, &c. There are other sorts in various districts, such as, Saint Julien, Saint Mambert, Pouillac, Saint Estepho, Saint Laurent, Ludon, Macau, &c. which, without enjoying an equal reputation, are frequently in no wise inferior to the first-mentioned. Those, which hold the first rank among the white wines, are Carbonnieux, Serons, Barsac, Prigniac, Sauterne, Baume, and Saint Croix du Mont. Languedoc has excellent dry wines, as well as some of a luscious kind. Hermitage is a red wine, the vine producing which is grown upon the banks of the Rhone, between Valence and Saint Valliere. Luscious wines, or liqueurs, are common in France: the most esteemed are those of Ciotat and of Saint Laurent, in Provence. Frontinac is, of all the luscious wines of France, the most perfect and the best adapted for keeping; it is made in

Languedoc. The muscadine of Lunel is of a more delicate flavour than Frontinac, but it will not keep so well. That of Rivesaltes is richer than either Frontinac or Lunel, and comes very near the Cape wine. Besiers is of a quality inferior to Frontinac, Rivesaltes, and Lunel.

Brandies.—The brandies made in France are esteemed the best in Europe. They are distilled in every part of the empire where vines are grown; and in the distillation of these valuable spirits, not only wines of inferior, but also those of the best quality, are used. The brandies which conduce to the commerce of France are those of Bourdeaux, Rochelle, Cogniac, Charente, Isle of Rhe, Orleans, the country of Blesois, Poitou, Tourain, Anjou, Nantes, Burgundy, and Champagne. Brandy is also made in Provence, where it is sold by the quintal. The brandies of Nantes and Poitou, whose qualities are pretty nearly alike, are the best made in France, and the most esteemed throughout Europe, being uncommonly well flavoured, fine, and strong. It is from these places that the largest quantity is exported. The English, the Dutch, the Irish, the Flemish, and Hamburgers, take off the greater part of the brandy, but the Dutch in particular obtain larger supplies than all the other nations of Europe collectively.

Vinegar.—The Orleans is esteemed the best of French vinegars. The commerce in this article is very considerable. The English, the Irish, and the Dutch, traffic largely in that of Guyenne, which they procure at Bourdeaux; in those of Orleanais, Blesois, Anjou, Aunis, and Brittany, through the ports of Rochelle, Nantes, and Saint Malo.

Oils—are of two sorts, namely, those made by pressing almonds, nuts, and olives, and essential oils made by distillation. Few of the latter description are exported, being chiefly used in the composition of perfumes, and in pharmacy. The best oils are those of Provence, and Languedoc; there are vast quantities made in Lower Dauphiny, in the county of Nice, of Aramont, and Oneille. The oils are chiefly exported to Holland, England, the North of Europe, and Germany.

Soap—is manufactured at Marseilles, Toulon, and other towns of Provence, and Languedoc. There are two sorts of soap, viz. white, and marbled. A good deal of common soap is manufactured in Picardy, Flanders, &c.

Hemp—is cultivated in Flanders and Picardy, and supplies the cloth manufacturers of these provinces with materials for working. In the territories of Rennes, Saint Malo, and Dol, in Brittany, hemp-fields occupy a space of twenty-five leagues. A great deal is also grown in Upper

Languedoc, and particularly in Auvergne, where the soil is peculiarly adapted to its culture.

Flax. — A large quantity is grown in Flanders, and serves for the manufacture of cambric. The seed is brought from Dantzic, and Riga. Flax is also raised in the provinces of Rouen, La Maine, Anjou, Brittany, and Languedoc.

Wood — is an object of great commercial importance to France. Mr. Arthur Young computed that 24,537,285 acres of land in that country were covered with wood, divided into six classes, viz. 1^o For ship-building. 2^o For the use of house carpenters. 3^o For the construction of carriages. 4^o For joinery. 5^o For vine-props, &c. 6^o For fuel. Oak is chiefly used for the first class; for the second, oak, fir, linden, and aspen-trees; for the third, ash, oak, maple, and especially elm; for the fourth, fir, beech, elm, pear-tree, apple, cherry-tree, cornil-tree, aspen, poplar, linden, &c.; for the fifth, osiers, and branches of various trees; that destined for the sixth class is divided into new and old, and is distinguished by the titles of *bois perdu*, *bois carnard*, and *bois en train*. The cork-tree flourishes on the French side of the Pyrenees, as well as on the Spanish side, and produces the finest cork-wood in the known world.

Wax. — There is some good bees' wax to be met with in Normandy, Sologne, Auvergne, and Brittany.

Silk. — The quality of the French silk, and particularly that of Languedoc, is good; it is made into woof, and even very beautiful orgazine. Since the establishment of the silk-mills at Vaucanson, the French orgazine has obtained a superiority over that of foreign countries. As to the woof, that of Alais and Languedoc is preferred to all others. It is made of every degree of fineness.

Sugar. — Strange as it may appear, this enterprising nation has attempted to domesticate the sugar-cane, as well as to extract sugar from various indigenous roots and plants. In both they have succeeded in a small degree, but not to such an extent as to occasion great apprehension to those who are interested in West Indian traffic.

Mines and Minerals. — Coal-mines are found in many of the provinces. In French Hainault there are some at the villages of Fresne, Condé, Awzin, &c. which have been worked for some time back. There are also coal-mines in Bombonnas at the village of Feins, in Forez, Boulonnais, Rouergne, at Decise, and in Nivernais, where coal is found within three feet of the surface; also at Carmeaux, in Albigeois, in Burgundy, between Beaune and Autun; in Anjou, near Saint Georges, Chanteloisin, and Concourson; in the same province, adjacent to St. Aubin de Luigné, Chalonne,

Chancefort, and Montjean; in Brittany, near Chapelle, Montrelais, and Niort; at Livry, in Lower Normandy, at Luisaiche, and, finally, in the neighbourhood of Paris. Besides coal, France possesses other combustible substances, such as petroleum of Gabian and Orthès, asphalts of Lamper-tolock, in the Lower Rhine, and of Caupenne near Ax; rosin is procured along the banks of the Rhone, from Seyssal to Fort-Ecluse. France is abundantly supplied with iron from its mines. The ore is not unfrequently found in large lumps upon the surface; and the strata are most commonly but a few feet below it. The Pyrenees abound in large banks containing iron ore. It is also found in Franche Comté, Champagne, Berri, Roussillon, and Lorraine. There are some rich copper-mines in the Pyrenees. There are also several of trifling note in other parts of France, the principal of which are those of Chessy and Saint Bel, near Lyons, and of Sainte-Marie-aux-mines in Vosges. Lead is much more common in France than copper. There is hardly a metalline part of the soil in which it is not found in abundance. Gold and silver are not by any means so common in the French mineral world, as any of the above metals, though the soil is not totally divested of those precious metals; and even the Rhone, the Rhine, the Doubs, the Gardon, as well as some other rivers, and many of the Pyrenean rivulets, have golden sands. Silver is found in the mines of Allemont and Sainte Marie; but it is most commonly attached to the lead and copper ore; and the former metal is particularly rich in this respect, containing, for every quintal of lead, nearly sixteen ounces of silver. The only mine of mercury is in the department of Calvados, at Menildot. Zinc is the most abundant of French semi-metals. It is found in three states in the mines, namely, in blende, white vitriol, and lapis calaminaris; the blende and lapis calaminaris are very common in France; the latter is found in abundance at Saint Sauveur, Cevennes, Pierreville, in the department of La Manche, at Montalet, district of Unex, near Bourges, near Saumur, and other places. Cobalt, a semi-metal, is found in the silver, and bismuth in the lead, mines. Cobalt is mostly to be met with in the Alpine mines, and bismuth in those of Brittany, Saint Sauveur, &c. France possesses mines of antimony, which might suffice for supplying all Europe with that commodity; the principal ores are those of Creuse, Cantal, Haute Loire, Vendée, &c. Manganese is not less abundant in France. Nickel, fire-stone, and vitriolic earth, are spread throughout every province. Common salt has not hitherto in France, as in England, Poland, and Spain, been discovered in a solid state. France, however,

carries on an extensive traffic in sea-salt. The provinces in which it is made are Brittany, Saintonge, Aunis, Normandy, Franche-Comtè, Lorraine, Languedoc, and Poitou.

Manufactures. — Having thus surveyed the principal productions of the French soil, we shall turn our attention to the various manufactures, to which these productions give life.

Linen-Cloth. — All the provinces, in a greater, or less degree, manufacture this article, but those, in which the largest quantity is made, are Normandy, Picardy, Hainault, Cambresis, Brittany, La Maine, Dauphiny, Auvergne, Gascony, Champagne, and Beaujolais. Normandy, however, ranks first in this line. The principal articles of linen-cloth made in Normandy are those called tow-cloths, made in the neighbourhood of Fecamp, and Bolbec; hemp tow-cloths, made in the valley of Longueville, and in the villages of Limery, Parillè, near Barentin, and in the neighbourhood of Rouen; *toiles d'ourville*, made at Ourville, and in some parts of the country of Caux; this sort is frequently used in the formation of oil-cloths, and umbrellas; *blancards*, made at St. George's; these are often sent to Cadiz, and thence to the Brazils; also into the French American colonies; *toiles à vestes*, made in the neighbourhood of Bacqueville, and sold in the market-place at Rouen; and strong flaxen-cloths, composed entirely of flaxen fibres, and of different widths, made in the neighbourhood of Bolbec, and Fescamp, Dieppe, Havre, &c. In Lisieux and its neighbourhood are made linen-cloths of various qualities, particularly that called *cretonne*; Saint Lo, and Canisy in Lower Normandy, furnish a vast quantity of ticking of various sizes; all the above, as well as many of the linen-cloths of Picardy, are sold in the market-place of Rouen. In the neighbourhood of Saint Laurent, Bacqueville, and Saint Vallery, are made *montbelliards*, or coverings for mattresses; at Saint Laurent, Sassetot, Genetot, and Toqueville, are made linen-cloths with blue and white grounds, which are used as shirts and breeches by the negroes and sailors. Damasked linen, also called marbled ticking, is made at Rouen, Saint Vallery, and Bolbec; brown ticking of Caux, in the environs of Bacqueville, and Saint Vallery; ticking, in the manner of that at Brussels, at Evreux; lindsey-woolsey at Rouen; striped linens, and cotton and linen stuffs, are made in and about Rouen, and in some villages of Caux; thread and cotton handkerchiefs at Bolbec, Yvetot, Saint Laurent, and in the environs. Besides the above articles, there are also made in Normandy and the other provinces already named, open-worked linen-cloths, for table-linen, called *feuilles de laurier*; ditto for napkins; as likewise druggets, canvas, sail-cloth, *crets*, linens called Brittany cloths,

Saint Jean, Auxonnes, rouleaux de Beaujean, tarares, burgeoises, velveteens, muslins, cambrics, lawn, gauze, &c. &c.

Laces. — *Blonde* lace is made of silk, point and other laces of black, and white, thread. The principal parts of France, in which laces are made, are Brussels, Malines, Valenciennes, Dieppe, and Puy. At Dieppe about 4000 women, chiefly wives and daughters of the seamen and fishermen, are employed in the manufacture of laces, and at Puy about 6000. Each of these women gains from eight to fifteen sols *per diem*. At Paris are made black, and white, laces; also at Caen, Lisle, (those made here are in imitation of Valenciennes laces,) Armentiers, and Bailleul (similar to those of Lisle). At Arras are made *minionette* and *entoilage* laces. Alençon's point lace has long enjoyed a reputation throughout France, England, Germany, &c. The manufacture of this lace employs about 8000 women in Alençon and its neighbourhood: the quantity of this article exported in the year 1802-3, amounted to 1,200,000 francs. There is also a very considerable manufacture of point lace, called *point d'Argentan*, at the village of Argentan.

Paper. — There are many paper manufactories throughout France; where are made three classes of white paper for writing, and printing, each class being divided into eight, or ten, different sorts. Besides these, are made the following: yellow, and blue paper, for drawing; a greyish sort called *papier à patrons*, blue sugar paper, blue paper for covering books, paste-board for bonnets, &c. brown and whitish brown, *joseph*, for printing; ditto pasteboard painted red, green, yellow, &c.; *joseph à soie* for wrapping up silk goods; brown pasteboard, for the inside of playing-cards; unicorn-paper for wrappers, &c. &c.

Cotton Stuffs. — There are nearly 120 cotton manufactories in France, which produce articles more, or less, perfect; in Normandy they are most numerous, and considerable.

Woollen Manufactures. — We shall divide these into two classes, viz. cloths; and camlets and baizes, &c. In the first class may be enumerated the cloths of Gobelins, Sedan, Abbeville, or *Van Robais*, of Louviers, Elbeuf, Rouen, Darnetal, Andelis, Montauban, and the various fabrics of Languedoc and Champagne: These are fine cloths. The coarser sorts are made at Chateau-Roux, Issoudun, Aubigny, Romorantin, Saint Aignan; at Roybons are made rateens, and also at Crest and Saillans; at Romans, cloths and rateens; at Saint Jean-en-Royans, cloths for billiard tables; cloths are also made at Grenoble, Valence, Die, Tulin, Chabreuil, Troyes, Beauvais, Dreux, Velogne, Vise, Saint Lo, Bayeux, Lodève, Loches, Beaulieu, Montresor, Amboise, Niort, Coulanges,

Monchamp, Fontenai-le-Comte, and Lusignan. In the rank of coarse cloths may also be placed the woollen-stuffs of Aix, Apt, Tarascon, Nay, Oleron, Rebenac, Orthès, Bagnères, Pau, Auct, Saint Godens, Saint Martory, and the valley of Aure; the cloths of Cevennes, Gevaudan, Castres, Mazanè, Brassac, Sommieres, Limoux, Saint Afrique, Mende, Ascot, &c. The greater part of these cloths bear the names of the various places in which they are fabricated; but these distinctions in regard to names operate in a very small degree with respect to the qualities of the articles. In the second class are comprised camlets of different descriptions, bolting-cloths, baizes, kerseys, serges of Aumale, Blicom, &c. callimancoes, turquoises, knaps, silesias, malboroughs, &c. There are besides wool, and hair-plushes made in various parts of France; the chief of these are made at Amiens. The fairs of Saint Germain at Paris, of Saint Denis, Reims, Caen, Guibray, and Beaucaire, are the principal cloth-markets of France.

Silk Manufactures. — The most considerable are those established at Tours, Lyons, Nîmes, and Avignon. That of the latter has for some years past been very inconsiderable; at present, however, there are thriving manufactories for Florentine taffetas, English taffetas, and damasks here. Nîmes manufactures silk of a quality far inferior to those of Tours, and Lyons (which are excellent), and at a much lower rate. The best gold, and silver, laces are made at Paris, and Lyons, and some of inferior qualities at Montmorency, Sarcelles, Estrepagny, &c. Ribbons are chiefly made in Paris and Lyons, but there is also a large quantity fabricated at St. Etienne, and St. Chaumont, which are sold as the manufacture of Lyons.

Stockings. — There are at Paris, Lyons, and some other parts of France, considerable manufactures of thread, worsted, and cotton stockings, ribbed and plain; but the chief manufactures in the stocking line are those of silk, which are manufactured at Paris, Lyons, Nîmes, Montpellier, Dourdan, &c. There are also made at the said places silk gloves, mittens, &c.

Tan Yards. — The best hides of France are those of the oxen of Auvergne, Limosin, and Poitou; those of Normandy do not afford good leather. Leather is prepared at Bayonne, Lectoure, and Saint Germaine. Those of the last-mentioned place are imitations of the Russian skins, and have been brought to a high degree of perfection, as have those which are made near the hospital at Paris, called *tannerie des guifs*. There are also hides tanned at Paris, and made into a species of leather called *enir des Hongrie*. Its repute is good. The best tan-yards of France are situated at Paris, Troyes, Cou-

lommiers, Reims, Mezieres, Laon, Soissons, Rouen, Caen, Bayeux, Monacoint, Verneuil, Perche, Mantes, Vernon, Chartres, Orleans, Tours, Provins, and Beauvais. Curriery is also a branch of French industry, which may be included under this head. The following are the various sorts of leather manufactured in France by curriers, viz. sleek-leather, made from the hides of oxen and kine; *curis en suif*, or greased leather for harness; *vaches d'Angleterre*, for harness, made at Nemours and Louviers; *vaches grasses*, for trunks, bellows, and pump leather; *vache blanche*, for shoes; calf-skins for various uses; goat-skins made at Paris, Rouen, &c. under the title of *maroquins*; sheep-skins; chamois-skins, made at Niort, Strasbourg, Grenoble, Annonay, Maringue, Nantua, &c.: besides these, buffalo hides are manufactured in France. Parchment is prepared at Paris, and a vast deal in Poitou, Gevaudan, Languedoc, Flanders, and Alsace.

Hats. — The manufacture of beaver hats is very considerable in France, particularly at Paris, whence they are not only sent to the provinces, but also to Spain and Spanish America by way of Cadiz. Those destined for Spain are generally black or drab-coloured, lined with satin of various colours. The other hat-manufactories of France in which hats of various descriptions are made, are in number about seventy.

Nails are made in almost every province of France, but the most considerable forges are in Normandy, Champagne, Limosin, Le Foret, and Charleville.

Cards for wool, &c. — form a very considerable branch of French traffic; the best are the Parisian; after which come the cards of Rouen, Dreux, Romorantin, Orleans, Troyes, Tours, Poitiers, &c.

Pins and needles — are made at Paris, Rouen, Evreux, and Aigle, and form no trifling articles of traffic.

Steel — is chiefly manufactured at Amboise, Saint Etienne, Colmar, and Grenoble, but there is likewise a great deal made in various other parts of France. The manufactures of the above-named places, are, however the most esteemed.

Tin. — There are four manufactories of tin in France, namely, at Massvaux, Bain, Morancourt, and Nevers.

Clocks and Watches — are made in many parts of France, but Paris boasts of the most considerable and esteemed manufactures in this line. The coarse movements are made at Dieppe, and in its neighbourhood. There are at present in St. Claude, and its environs, 155 watch-makers, and about 91 clock-makers.

Jewellery — although forming a branch of considerable industry in many of the towns of France, is chiefly confined to Paris, where

every article in this line, as well as gold, and silver, toys, &c. are carried to a pitch of perfection which cannot be equalled by any nation on the earth, if we except the English.

To these manufactures may be added others of importance, into a detail of which our limits will not permit us to enter; we shall, however, enumerate them; viz. fire-arms, ironmongery, wax, bleaching, wax-candles, cordage, delft, and pottery, leather-gloves, porcelain, glass in the highest perfection, and of every description, salt-petre, sugar-refineries, &c. &c.

The soap, and wash-balls, made in different parts of France, especially those of Marseilles, and Paris, are highly esteemed all over Europe.

Commerce.—Having already stated, under the heads of *Productions* and *Manufactures*, the articles of French traffic and commerce, little more remains to be said than what relates to the various countries, with which this great nation trades. The internal commerce is chiefly carried on by means of the fairs, which are appointed to be held, upon stated days, during every month, at places too numerous to be here set down, and whither the merchants from all parts of the country resort, to purchase the articles of the various provinces in which those markets are held.

Commerce with Spain.—The following commodities are brought into France from Spain, viz. wool, kali, horses, mules, eatables, as well animals, as vegetables, brandies, liqueurs, wines, and various manufactured articles. The exports of France consist of manufactured articles, wine, brandy, fruits, &c.

Commerce with Portugal.—The articles brought from Portugal are hides in the hair, Brazil tobacco, olive-oil, and dried fruit. There are also occasionally brought from Portugal Indian commodities, spices, raw cotton, dye-woods, inlaid work of the East and West Indies, and luscious wines. The exports are manufactured articles, eatables as well vegetables as animals, &c. There is annually a balance in favour of Portugal, which balance is paid in money by the French.

Commerce with Italy, Piedmont, Savoy, and Switzerland.—The contiguity of Piedmont and Savoy to France, Italy, and Switzerland, is sufficiently indicative of those states being the channel of intercourse between the said countries; we shall, therefore, without further comment state, that the imports of all those places amount annually to more than eighty million francs, and consist chiefly of silken ribbons of Padua, thick crapes of Bologna, stuffs, and silken velvets, of Genoa and Florence, raw-silk, white and painted cottons, of Switzerland, various articles of

animal consumption, olive-oil, and wines. The exports of France for Italy consist of manufactured articles, cotton thread, destined for Switzerland, vegetable, mineral, and animal commodities, wines, brandies, and the commodities of the French West India islands. See ITALY.

Commerce with England, Scotland, and Ireland.—The commerce of France with England, Scotland, and Ireland, particularly with the latter, is very considerable: they consist of manufactures, beer, vegetables, and animals of England; the same, and dried fish, &c. of Scotland; butter, salt provisions, linens, &c. of Ireland. The exports of France for the said countries consist of wines, brandies, vinegar, laces, cambrics, fruit, &c. &c. This statement, it is to be understood, only refers to legal commerce, and it is generally fettered reciprocally by very heavy duties, the policy of which may be extremely doubtful.

Commerce with Germany, Poland, Prussia, &c.—The imports from these countries are manufactured merchandise, the tapes, mercery, and hardware of Germany; coal from Austrian Hainault, brass-wire, and potash from Hungary, Poland, and Prussia. The exports of France for these countries are, 1st, manufactured articles, especially silk stuffs, embroidered with gold, and silver, lawn and woollen stuffs; 2dly, raw wool, coal, &c. for Austria and Germany; 3dly, wines, brandies, and vinegar for Germany, Poland, and Prussia; 4thly, West Indian commodities, particularly sugar and coffee, for the States of Austria, and the ports belonging to the king of Prussia, at the entrance of the Baltic; 5thly, and finally, vegetables, minerals, and animals.

Commerce with the North.—The French do not carry on a very active commerce with the northern nations. The amount of the exports for all the aforesaid countries is small, viz. 1st, manufactured articles for Russia, and the Hanse Towns, and a small quantity for Sweden, and Denmark; 2dly, various raw and unmanufactured commodities, such as indigo and other dyes, cotton, &c. for the Hanse Towns, Sweden, and Denmark; 3dly, wines and brandies to the Hanse Towns, Denmark, and Russia. 4thly, vegetables, minerals, and animals; 5thly, and finally, sugar and coffee, the produce of the French West Indies, nearly three-fourths of which articles are purchased by the Hamburgers, the remainder being nearly equally divided with Denmark, Sweden, and Russia. The imports from these countries generally consist of the principal articles of commerce of each of these countries, which will be found under their respective heads.

Commerce with the United States of America.—This commerce owes its existence to the rupture between North America and

England. Previous to the French Revolution, it was carried on with spirit, and is reviving; the laws of French commerce with respect to the importation of American commodities, giving every encouragement to the intercourse of the two nations.

Commerce with the Ottoman Empire, and the Nations of Barbary.—The greater part, indeed we may almost say the whole, of this commerce is confined (on the part of France) to the port of Marseilles. From Marseilles are sent to the ports of the Levant the cloths of Languedoc, (principally those manufactured at Carcassonne, Clermont, and Lodève,) dye-woods, such as log-wood, &c. sugars, coffee, and indigo, cochineal of Cadiz, cinnamon, pepper, cloves, lead, iron, pewter, tin, writing-paper, liqueurs, syrups, fruits, mercury, tartar, vermilion, millinery, silken stuffs, lace, silk handkerchiefs, linen-cloth, toys, mercery, and sequins, or Spanish dollars. In return, Marseilles receives raw and spun cotton, wool of every description, gum, wax, silk, galls, madder, opium, goats' and camels' hair, raw and dressed hides, tallow, brass, carpets, coverlids, some linen, scammony, kali, coffee, incense, myrrh, rice, saffron, sal ammoniac, tamarinds, senna, ostrich-feathers, corn, barley, beans, split-peas, millet, and olive-oil. The trade to the Levant, before the Revolution, employed four hundred vessels.

Commerce with India and China.—This commerce was established in the year 1664, and vested in a company similar to that of England. Various revolutions took place in its government before the French Revolution, when the National Assembly passed a decree for unlimited commerce with India and China: in consequence of which, the intercourse has continued free, and the trade open to the French merchants in general to the present day.

France, before her revolution, possessed many colonies in different quarters of the world, but by the peace of Paris in 1814, she only retains Martinique, Guadaloupe, and Mariegalante, in the West Indies; in South America, Cayenne; in the East Indies, Pondicherry, and an insignificant territory; and some small factories on the western coast of Africa.

Paris, though from its inland situation incapable of being a greatly commercial city, has an indirect foreign trade through the northern ports, and an extensive inland commerce. The exchange business done in it is very great, and every merchant in the interior has a banker at Paris, and bills from foreign countries are usually made payable there.

It is much beyond our proposed limit to notice the particular cities and towns of other countries, as we have done those of England, but it may be necessary to observe

upon a few of the principal commercial ports of France.

Bordeaux—is 75 miles from the sea on the river Garonne, has a good harbour, is capital of the department of the Gironde, and abounding in manufactures. It has a great trade, especially in claret, and brandy.

Havre,—in the province of Normandy, is the port by which most of the colonial produce and British manufactures go to France, the expenses being less than by Bourdeaux.

Calais,—the key of France from England, carries on a considerable smuggling trade, but not any other to any degree of commercial importance.

Rheims,—and *Troyes*, both on the Seine, are famous for the wine called Champagne, which is exported to all parts of the world.

Dijon,—in Burgundy, is famous for its commerce in the wine which takes its name from this province.

Marseilles, the principal place in Provence, has an extensive trade to the Levant, and indeed to almost all parts of the world. It has been declared a free port by royal ordinance.

Accounts were formerly kept in livres Tournois, each livre consisting of 20 sols, and each sol or sou of 12 deniers. They are now kept in francs, each franc consisting of 100 centimes.

GERMANY.—The ancient division of this country into circles was entirely obliterated when Austria renounced the supremacy of the empire, at the requisition of Napoleon Buonaparte. Germany, therefore, now consists of a confederation of independent states, of which Austria is indeed the principal and head, having for her confederates Prussia, Bavaria, Wurtemberg, Hanover, Saxony, Hesse Cassel, Baden, Hesse Darmstadt, two Mecklenburgs, Oldenburg, the Netherlands for the sovereignty of Luxemburg, Denmark for Holstein, some inferior provinces, and the free cities of Hamburgh, Lubeck, Bremen, and Francfort.

This country is very favourably situated for trade, being nearly in the centre of Europe, and having easy communications with the Baltic, the North Sea, and the Mediterranean, by means of many navigable rivers which flow through its whole extent. Vienna, the old capital of Germany at large, now of the empire of Austria, is the centre of all commercial transactions in that kingdom, as payments at the port of Trieste, and other commercial places, are generally made by bills on Vienna. The most important part of the trade of Vienna is that carried on with Turkey. This is all that it is thought necessary to say of Austria individually, except that there are two commercial companies which are advancing the trade of this country with activity, viz. the Bohemian Linen Company, who make ship-

ment to South America, and the Egyptian Company, who have an establishment at Smyrna; that the territorial extent of the Austrian dominions is calculated at more than 12,000 square miles; the population, in round numbers, at about 28,000,000; the capital 20 English miles in circumference, with a population of 500,000 inhabitants.

Productions.—The soil of Germany is rich, and fertile in all sorts of natural productions. Those parts regarded as the best, in this respect, are the palatinate of Westphalia, Saxony, Franconia, and Bavaria. Of vegetable productions, Germany furnishes rye, wheat, maize, Turkish corn, spelt, barley, oats, peas, beans, vetch, lentils, millet, and buck-wheat; a great part of these productions is exported. Rice is cultivated in Moravia, and throughout the country are gathered manna, hemp, flax, hops, aniseed, cummin, tobacco, madder, saffron, truffles, potatoes and vegetables of various kinds; fruits, such as apples, pears, cherries, plums, chesnuts, almonds, olives, medlars, figs, peaches, apricots, oranges, lemons, limes, filberts, and nuts of various sorts. Finally, vines of different species are cultivated here. Germany produces such abundance of grain, that Franconia, Thuringia, the duchy of Magdeburgh, and its environs, Pomerania and Holstein, not only supply their neighbours, but also foreign countries, with almost every kind. The corn passes by way of Hamburgh and Bremen upon the ocean, into the ports of the Baltic, where the Dutch and Swedes are in waiting to receive it. The Swiss also procure their grain from that part of Germany which borders upon their country. Wine is one of the productions of Germany, which contributes most to the commerce of the country; according to a Swiss writer, the most celebrated wines of Germany are those of the Rhine, and more particularly those of Hokum, Laubanum, and Riedesein, in the environs of Mentz. The wine of Moselle comes next, and after it the red wine, called *Pleiker*, which is grown between Mentz and Rinfeld upon the Rhine. The wines of the palatinate and of the margravate of Baden possess a considerable share of reputation. The wine of Neckar is thin, but very palatable. The *Liebfrair melk* of Worms is a strong, full-bodied wine. In Franconia is grown a quantity of wines, but none of them, if we except that of Steinhart, near Wurtzburg, are esteemed. Busching tells us, that there are in Germany wines which might be put in competition with those of France and Hungary. The best are made in the circle of the Lower Rhine, namely, the Rhenish wines, or hock, (amongst which that of Rhinogar is esteemed the best,) and the wines of Moselle. There are also some passable wines to be met with amongst those

of Franconia, Neckar, and Kocher; the Germans have likewise red wines and clarets. Austria produces excellent wines. Those of Bohemia, Moravia, and Lower Lusatia, and those of Upper Saxony, are much inferior to the foregoing. Germany may justly be termed a magazine of hemp and flax; nevertheless, Germany does not export much hemp. Heretofore Germany was covered with forests, of which there are to this day very valuable remains. The number, however, visibly decreases, and more than one province is already in want of wood for fuel and for carpenters' work. The forests of Germany, in general, furnish oak, beech, different species of fir, birch, aspin, alder, linden, ash, larch, and maple. Franconia, and particularly Bamberg, furnish a great deal of liquorice; the lower palatinate contains whole forests of chesnut-trees, olives, and particularly fine walnut-trees. The forests of oak and beech afford excellent fodder for pigs. A quantity of pearl-ash and pitch is made in various parts of Germany. The principal forests are situated in the palatinate of Franconia, in Wirtemberg, Hesse, and Saxony. In Germany are fed a vast number of oxen, kine, sheep, horses, goats, and pigs. Holstein and Oostfrise, together with the duchy of Bremen, furnish cheese and butter of the best quality; and wax and honey are abundant throughout Germany. The wool of this country is far inferior to that of England, Spain, and even France. The parts in which the most wool is to be met with, are the borders of the Rhine, Austria, Saxony, Mecklenburgh, Pomerania, and Bohemia: these wools are generally named from the place whence they come, such as the wool of Rostock, Gripswald, Stralsund, Anclam, Stetin, Thorn, &c. They also have names which denote their particular qualities, as Rhenish, little spark, summer wool of Poland, heath wool of the Rhine, &c. Many counties of Germany breed fine and beautiful horses, such as Holstein, Oostfrise, Oldenburgh, Wirtemberg, Anspach, Bamberg, Wurtzburg, and the hereditary lands of the houses of Austria, and Hanover. From the latter, his majesty the king of Great Britain procured those beautiful cream-coloured horses which he uses on state-days. Mineral productions are very abundant and various in Germany, viz. potters' earth, terra sigillata, porcelain earth, and tripoli. Among the fossils are marble, alabaster, slate; divers kinds of agate, namely, carniola, chalcedony, onyx; also jasper, lapis lazuli, jasponea, crystal; the precious stones are diamonds, rubies, sapphires, topazes, emeralds, chrysolites, amethysts, granites, hyacinths, and rock-crystals; amongst the salts are vitriol, alum, saltpetre, sulphur, and finally, common salt, wherewith Germany is more abundantly supplied, than any other

part of Europe. The demi-metals are quicksilver, red-lead, leaden ore, antimony, cobalt, bismuth, and arsenic; and the metals consist of iron, steel, copper, lead, silver, (with which the empire abounds,) pewter, and gold; which last is found not only in mines, but in the rivers, such as the Rhine, Oder, &c. The principal mines of Germany are, in Westphalia, those of iron, lead, and lapis calaminaris; in Saxony, silver and gold mines, three of the former, and one of the latter, and likewise two of copper; in Austria, mines of copper and iron; in the palatinate, mines of iron and copper, and lapis lazuli; in Carinthia, gold, silver, and lead mines; in Bavaria, six gold mines, two silver mines, one of quicksilver, iron, copper, alum, and antimony; in Franconia, four copper and lead, and one of iron and lapis lazuli; in Hesse, two gold, one silver, two copper, one iron, quicksilver, alum, and salt, and two lead mines; in Liege, are mines of iron, copper, gold, sulphur, saltpetre, and coal; in the bishopric of Trent, are mines of gold, silver, lead, pewter, and iron; in Wirtemberg, mines of silver, copper, and iron. The Black Forest of Suabia is remarkably rich in iron ore, and some mines are worked here with considerable effect. There are considerable salt-works in the Tyrol, Austria, the duchies of Magdeburgh, and Lunenburgh, and in Thuringia.

With the exception of those carried on by the small towns situated upon the German ocean, and the Baltic, the only fisheries in Germany are those of the rivers. The Elbe, the Danube, the Oder, and the Weser, are the most productive rivers.

Manufactures.—Linens are made in almost every part of the empire, but principally in Austria, Saxony, Lusatia, Silesia, and Upper Germany. A great quantity of these articles is exported *via* Hamburg. In several parts of Germany are made damask table-cloths, coloured linens wrought in squares, also oil-cloth, ticking, tapes, and lace, the latter of a very fine fabric. All sorts of paper, such as writing, lapping, marbled, and gilt paper, are made in Germany. Woollen manufactories are spread throughout the empire, but they are mostly for the coarser kinds of goods, and furnish very little to the export-trade, unless, indeed, we except the cloths of Silesia. There is also a small quantity of woollen goods exported from Westphalia and Hesse. Austria, Saxony, and Brandenburg, contain manufactories for silk goods of every description. The mineral substances afford matter for the exercise of industry in the manufacture of earthen vessels, pipes, porcelain, and delft. The porcelain of Saxony is celebrated; there is also some made at Frankendal, but it is of a quality far inferior to that of the former. There are many iron-works at Nuremberg, and in Silesia, Saxony, and

Holstein; the tin and files made at the first-mentioned place are much esteemed: at those places there are likewise copper-works, the produce whereof is, in part, exported. Augsburg, and Nuremberg, have manufactories of gold and silver articles, of which the Poles, and the Russians, purchase large quantities.

Commerce.—Germany carries on commerce, more, or less, extensive, with the other European nations, by the following modes:—With England, by Holland, the Rhine, the Weser, the Elbe, Bremen, Embden, and Hamburg; with France, by Alsace, the Rhine, the Moselle, the Meuse, &c. and by Holland; with Italy, by Triest; with Spain, by Holland; with Holland, by the Rhine, the Elbe, and the Weser; with the Northern Nations, by Holland, the Rhine, the Elbe, the Weser, and the Baltic; with Russia, by Holland, the Elbe, the Weser, and the Baltic; with Turkey, by the Danube and the Black Sea. Since, however, the communication between Servia and Austria has been opened, a great quantity of merchandise daily arrives in the Austrian territory, on its way to Vienna. In a short time that city will become a depot for the produce of the Levant. It also receives quantities of goods by the way of Brody and Galicia; these goods are shipped from the port of Odessa, in the Crimea, to Brody: the expenses of land-carriage from the banks of the sea to Brody are very trifling. The chief commercial towns of Germany are, Frankfort on the Maine, Leipsick, Nuremberg, Augsburg, Vienna, Fiume, and Triest, which is a free port. An East India Company was established at Embden in 1750, and another association for carrying on trade with Bengal in 1754, neither of which has been successful. Germany is celebrated in the annals of commerce for the Hanseatic League, which was entered into by several of the maritime towns, for the protection of trade. The exports of Germany consist of cloths of all sorts, woollen and cotton, East and West Indian produce, hard-ware, cutlery, tin, and lead.

Since the partition of Saxony at the last definitive treaty of peace among the European powers, the king has found it necessary to make several new regulations for the greater encouragement of trade in the remnant of his dominions which are left to him. By an ordinance bearing date the 20th January, 1816, many prohibitions and restrictions are removed, and the duties on the import, and export, of commodities modified and altered.

The accounts of this extensive country, comprehending so many different independent governments, are kept in a great variety of monies. At Vienna, the capital, in guldens, each gulden consisting of 60 kreutzers, and each kreutzer of 4 pfenings.

At Berlin, and in the whole electorate of Brandenburg, in thalers or rix-dollars, each consisting of 24 gute groschen, each groschen of 12 penings.

HAMBURGH, and the other free cities of Lubeck, Bremen, and Francfort, deserve a separate consideration. The first mentioned of these is situated on the river Elbe, which is here six miles broad, and will bring vessels of 14 feet draught up to the town. The principal trade of this place consists in exporting the produce of Germany, and supplying it, in return, with all kinds of foreign goods from every quarter of the globe.

All merchandise imported, or exported, by sea (with certain exceptions, too numerous to be inserted conveniently) pay a duty of $1\frac{1}{2}$ per cent. currency, *ad valorem* banco, which must be paid before landing. If goods arrive for immediate re-exportation, they may be bonded on arrival, and pay no duty. The coin of Hamburg is called currency; it is all of silver. The bank of Hamburg affords a great convenience; most of the merchants of the place depositing their funds in it, and making their payments through it. The exchange business done here is prodigious.

Lubeck is situated between Holstein and Mecklenburgh, on the river Trave, and connected by other rivers with Holstein, Hamburg, and the ports of the Baltic. It has some manufactories of leather, linen, tobacco, soap, &c.: it has no direct exchanges, but bills are drawn and made payable at Hamburg.

Bremen is situated on the river Weser, 45 miles from the sea; it has, nevertheless, a good trade with the interior of Germany, from the charges of receiving, forwarding, selling, buying, and shipping of goods, being exceedingly moderate. A great quantity of manufactured goods from England find their way into Germany through this place.

Francfort is a place of celebrity from its two great fairs at Easter, and Michaelmas. At them merchants from every part of the continent attend, and sell, and barter, the commodities of their respective countries.

The importance of these free towns to the trade of Great Britain is immense; especially since the establishment of the kingdom of the Netherlands. Such heavy duties have been imposed by the last mentioned government on the transit of English manufactured goods, that they are no longer sent to Germany through Holland, but through these free towns, especially Hamburg, from which they can even be conveyed by land-carriage to the interior of Germany cheaper than through any of the Netherland ports. Accounts are kept here in marcs, each marc consisting of 16 shillings, and each shilling of 12 penings.

HUNGARY has been in possession of the Austrian monarch ever since 1597, and was finally settled on the heirs male of that house in 1687, and in 1723 upon heirs female, in case of failure of heirs male. The ordinary revenue of the kingdom arises from mines, duties on cattle, royal demesnes, salt-works, customs, &c. Presburg is the capital, but a place of little trade, and less manufacture. It is, however, the principal market for the wines of the country, which may be called its staple commodity.

Productions.—This kingdom is amply provided with every thing which can contribute to the wants or comforts of humanity; the flat country produces abundance of grain, hay, vegetables, wood, tobacco, saffron, medicinal herbs, melons, hops, millet, &c. &c.: indeed so great is the fertility of the Hungarian soil, that the inhabitants, not being able to find room for the whole of its produce in their houses and barns, are obliged to pile it up in the fields, and cover it over with stubble. To the gifts of nature just enumerated may be added the excellent fruits and wines, the produce of this country: the latter are preferred to the wines of Spain, and are made in such vast quantities, that the inhabitants cannot oftentimes find vessels to hold them. In commerce the wines of Hungary are divided into two classes, viz. the wines of Upper, and of Lower, Hungary. Those of Upper Hungary are Tokay, Muschlac, Mischkoz, and Erlan. Those of Lower Hungary are Edinburg, Buda, Neusidel, Goldberg, and Saint George. From each of these wines are made four different qualities or degrees, viz. 1st, Essence, made from picked and half-dried grapes. 2dly, Ansbruch, made from the grapes which have been used for the making of essence; this is what is exported as Tokay. 3dly, Muschlac, made from the husks of Ansbruch. 4thly, Landvein, made from the worst sort of grapes. Hungary also furnishes excellent beer; that of Cabsdorf, Karserstadt, Lentschow, Presburg, and Newsol is the most esteemed. Tobacco is another considerable production of Hungary; a pretty accurate conception of the extent of its cultivation may be formed from the statement of Hungarian exports in 1800, when 100,759 lbs. of snuff, and 3,278,137 lbs. of leaf-tobacco of native growth were exported.

The Hungarian horses are strong, and capable of undergoing great fatigue; the oxen, of which a great number are annually exported, are for the most part of a mouse-colour. The race of buffaloes is improving; they serve for tilling the ground.

Manufactures—are not numerous in Hungary. Here is made a sort of felt, which is not only close, but pliant; moreover, it so durable, that no rain, however heavy, will penetrate it. Among the manufactures may be mentioned those of sole-leather, and

potash, the former whereof is prepared at Presburg. There is also a cotton-factory in Holitsch, which was founded in 1754 by a merchant of Vienna.

Commerce.—The exports of Hungary consist of wines, saffron, oil, metals, minerals, oxen, skins, leather, wool, tallow, honey, and wax; and the imports of spices, pewter, silk, and some other sorts of foreign merchandise, such as silken and cotton stuffs.

The Empress Maria Theresa took great pains to promote manufactures and commerce. She sent for weavers, and other artificers, from Flanders, and established a manufactory of cloth. The Hungarians are naturally proud and fierce, and more addicted to the service of the field, than to the sedentary employment of the loom; but recently a mercantile spirit seems to have arisen, which may, in time, lead them to rival other countries in manufacturing and commercial industry.

Accounts in Hungary are kept as in Austria.

IRELAND. — Productions.—These principally consist of black cattle, sheep, hogs, butter, cheese, &c. of salt, wood, honey, wax, furs, hemp, flax, linen, wool, and metals, and minerals. The Irish horses are, generally speaking, smaller than the English; but their strength is by no means conformable to their size, and the apparent ease with which these little animals carry great burthens, must excite the surprise of such as have been accustomed to see the large horses of other countries. The oxen pastured in Ireland are extremely fat, and their flesh more delicate than that of any other oxen in the world. A great portion of the commerce of Ireland arises from her abundant stores of black cattle, which have been within the last fifty years much improved by crossing with the English cattle of Leicestershire, and Staffordshire. Immense quantities of beef, pork, &c. are annually cured in Ireland, and exported principally to the West Indies, and in time of peace to France and Spain. The Irish bacon is not so fine as the English, but it is nevertheless in high repute in foreign markets, and a great deal of it is imported every year into Great Britain. The hides of the oxen, slaughtered for exportation, give rise to another branch of commerce: they are sent, as well raw and salted, as dried, to England, to the West Indies, and to the continent of Europe. Irish butter keeps better, when salted, than the English, or the American; it is exported to Spain, Portugal, Germany, the Baltic, to the West Indies, and even to Asia; much of this article is likewise sold in the London market, after having the salt washed out. The horse-hair of this country is much esteemed, and it is said that no part of Europe furnishes larger quantities of this commodity than

Ireland. The best wools are of a quality approaching that, which is the produce of the Leicester breed, by the recent introduction into Ireland of English sheep. Besides these, there are other species of wool, whereof a great deal is sent to England, and the remainder made into friezes, and different kinds of coarse woollens, for the wear of the lower classes of Irish. The soil of Ireland is peculiarly adapted to the cultivation of saffron, and some of very excellent quality is grown in different parts of the country. The culture of hops is very circumscribed; some individuals, however, have grown a few hops, which were found to be, in point of quality, a sort of medium between the Kentish, and Worcestershire hops. Scarcely the semblance of a forest remains in Ireland, though several formerly existed; their place is unhappily usurped by the moors or bogs, which form a remarkable feature of the country, being, by a report made to parliament, more than one million of acres.—These bogs furnish an abundant supply of good fuel, and even add to the durability of the timber, which is found universally buried beneath their surfaces; and, from the tanning principle of the bark, they have the property of converting to a sort of leather, the skins of men and animals who have the misfortune of being lost, and remaining in them for any length of time. The soil and climate are extremely favourable to the cultivation of flax, the land being rich, and the air mild and temperate. The humidity of the atmosphere is another auxiliary to the advancement of this branch of agriculture; and hence Ireland produces flax, which, as to quantity, and quality, may be put in competition with the flax of most other parts of the world. The greater part of the flax-seed sown in Ireland is brought from America, and the government of England has, by premiums and bounties, given great encouragement to this highly useful species of cultivation. Potatoes constitute the chief article of food among the poorer classes of the Irish, and are grown in almost every part of the island. The Irish potatoes are of the very best quality, and large quantities of them are not only sent to England, but to foreign parts. The early (about the year 1600) and exclusive (at that period) European use of this vegetable in Ireland, has occasioned much conjecture respecting the first introduction of them. The most probable account is, that they were brought by Sir Walter Raleigh to his estate at Youghal, from America, where they were called by the natives *badatas*. The soil, however, of Ireland must be especially congenial to the production of this root, for certain it is, that in every other part of Europe they degenerate, if not occasionally replenished from this, emphatically denominated, “Land of Potatoes.” The grain of Ireland is much of the same sort with

that grown in the midland shires of England: immense crops of barley are annually gathered for the consumption of the distilleries; and very little of any species of grain is exported. The fisheries give rise to a considerable export trade, as well as to internal commerce, more especially those of herrings and salmon; the last is principally exported from Dublin, Waterford, Limerick, and Galway; the herrings of the last mentioned place are larger than those of the other towns. Herrings are exported from Ireland to Spain, Portugal, Italy, the West Indies, North America, and France. Londonderry, Colerain, Dublin, Waterford, Limerick, and Drogheda, are most noted for producing fine salmon; at these places, and in their vicinities, the fish is smoked by means of turf fires, which communicate a delicious flavour to it, and render the Irish salmon a most valuable and desirable commodity in many foreign markets. The coasts of the island abound in almost every kind of fish known in the European seas, and it may with truth be said, that there is no metropolis better supplied with fish than the city of Dublin. The Carlingford oysters are the finest flavoured of any caught in the British dominions: the demand for these oysters is so great in Ireland, that none of them are left for exportation. Since the reign of Elizabeth, iron mines have been worked in this country, and there are still some of these, which afford very excellent ore. Copper ore is found in various parts, and many of the mines contain evident marks of having been wrought at a distant period. Lead is found in great abundance, and yields a large proportion of silver: a mine in the county of Antrim is said to yield a pound of silver from 30 pounds of lead. White lead ore, grey cobalt ore, manganese, and blende, are found in various parts of the country. The county of Kilkenny is noted for the production of its coal, which makes no smoke in burning, and when completely ignited resembles a mass of melted glass; it is carried to distant parts of the kingdom. Marble, as well red, as black, white, and elegantly veined with parti-coloured streaks, is found in many parts of Ireland; the red, and veined, marble are not so common as the black, of which large quantities are dug in the neighbourhood of Kilkenny; and this town is even paved with it: when taken at first from the quarries, this species of marble appears of a greyish colour, but on being polished it assumes a fine black surface: of this valuable stone no inconsiderable quantity is exported, and a great deal of it is sent to Dublin, and other populous cities and towns throughout the kingdom of Ireland. Fossils, minerals, and semi-metals of various kinds, abound in most parts of the island; but as they are not much sought after, and

give rise to no species of commerce, we deem it unnecessary to enumerate the different species.

Manufactures.—Ireland was distinguished, at an early period, for her manufactures of woollen stuffs, yet the spirit of industry made little progress, and the chief Irish manufactures are of recent institution. The linen manufacture was not unknown in Ireland in more early times, as appears from acts of parliament, in the reigns of Henry VIII. and Elizabeth; in that of William III. it became an object of consequence, and in 1699 such high duties were imposed on Irish woollens, that the manufacture was nearly abandoned, and the efforts of industry directed to the linen trade; in 1780, the annual produce of the linen manufacture was computed at about 2,000,000*l.* sterling, and in the year ending January 1799, the value of the Irish linen exported to Great Britain, exceeded 2,500,000*l.* exclusive of that sent to America, and consumed at home, and since it has considerably increased each succeeding year: the Irish linens are not subject to the payment of any duty, on being brought into England: this important branch of industry is principally confined to the province of Ulster, which produces linens, the fineness of whose texture, and excellence of its bleaching, are not to be equalled by the linen manufactures of any other nation. Linens are likewise made in other parts, besides the north of Ireland, but in very small quantities. In Dublin there is an extensive edifice called the Linen Hall, which is entirely devoted to the reception of linen cloth; here the linen factors have apartments, and hither linen merchants repair from all parts of the united kingdom, and even from foreign countries, for the purpose of purchasing this great staple commodity of Irish trade. Linen yarn, the greater part whereof is likewise spun in the north of Ireland, is kept on sale in another building adjoining the Linen Hall, and of this article immense quantities are annually bought up, as well for home consumption, as for exportation. The linens of Ireland are chiefly of that description called shirting; but there are also other kinds made here, especially damask table-cloths of the most beautiful kind, besides sheeting and towels: the author of this work had the honour of purchasing a complete suite of table linen, of the Irish manufacture, by the order of the late unfortunate queen of France, which was so much admired abroad, that several of the French nobility procured table linen of the same fabric for their own use. In Ulster, and some other parts of Ireland, there are considerable manufactures of cambrics, lawns, and muslins: the two former are accounted no wise inferior to the produce of the Flemish manufactures, and great quantities are exported to Eng-

land, to America, to the West Indies, and to the continent of Europe. At Limerick there is an important manufacture of leather gloves, esteemed superior to any thing of the kind in the united kingdoms. Cotton and thread stockings are woven in many parts of Ireland, and some of them are exported to England, and to foreign countries. Very little fine woollen cloths are manufactured here; but of friezes, flannels, serges, and other sorts of coarse goods, large quantities are made in many parts of the kingdom, especially in the counties of Wicklow, Wexford, Kilkenny, and Waterford. In the neighbourhood of Dublin, calico-printing is carried on to a great extent, and in that city an earthen-ware manufactory has been in a flourishing state for several years past. In the Earl of Meath's Liberty, which is the name of a certain quarter of Dublin, the different branches of the silk trade are carried on with a vigour, and have been brought to a pitch of perfection, which do high credit to the active spirit, taste, and ingenuity of the Irish nation. Woollen and worsted manufactures are also conducted with the same laudable activity, in the same quarter of the metropolis, and in other parts of the city and its suburbs. Heavy iron works are the principal sorts of hardware manufacture in Ireland; there are, nevertheless, many other small articles in this line made in different parts of the country. Immense quantities of kelp are prepared all along the coasts of Ireland, as well as in many of the small islands adjacent to this kingdom, such as Lambay, Ireland's Eye, &c. &c. For a considerable period, indeed until within these few years, Ireland was in the habit of procuring nearly all the porter and other kinds of strong beer consumed in the country, from London, and Liverpool. Porter breweries have, however, been established at Dublin, and Cork, and the best proof we can give of their produce being, at least, as good as that of the London breweries, is, that there has been very little imported of late years. The distillation of whisky from malt, constitutes an amazing branch of manufacture and commerce, as well external, as internal. The following information, with respect to the Irish distilleries, was presented to the House of Commons within the year 1808. "There are upwards of 3000 private distilleries in Ireland. In one day, from seven o'clock in the evening till four the next evening, were seized and destroyed 101 distilleries in the month of October 1805, in the barony of Ennishowan, in the county of Donegal, where, by information, there were upwards of 1300, also a considerable number of private malt-houses." There are very few distillers of capital in Ireland. The private distillers make a greater quantity of spirit from malted oats, than from barley. They malt oats in the north of Ireland, in bog-holes, in sacks wetted, and then they

bring them up to their barns, where the process is carried on, and they are afterwards dried upon what they call corn-kilns. The Irish whisky is exported to England, America, and the Baltic. There are glass-houses at Dublin, Cork, and Waterford, the produce of which, particularly that of the last mentioned city, is so excellent, as to be exported in large quantities. There are likewise some sugar refineries in many large cities and towns, but they are not of sufficient magnitude to answer the demand for refined sugar, and therefore considerable quantities are imported from England. The manufacture of snuff is carried on to a great extent at Dublin.

Commerce.—The commerce of Ireland had long been shackled, and the spirit of commercial enterprise damped, by the severity of the restrictions which English parliaments had laid upon the import, and export, trade of the country. In the year 1780, Ireland was placed nearly on the same commercial basis with Great Britain. From this epoch, not one of the least glorious in the annals of Irish history, foreign trade has rapidly increased, and this country, at the present day, participates in most of the commercial advantages formerly monopolized by England. With France, in time of peace, Ireland carries on a more extensive commerce than Great Britain itself. The wines of French growth are bought up with avidity, and are not only consumed by noblemen and persons of rank, but by the merchants and other traders of the kingdom. Claret is the wine mostly drunk in Ireland. Portugal draws large quantities of provisions, principally butter, besides linen cloth, &c. from Ireland, and in return supplies her with port wine, of which there is an immense consumption throughout the kingdom. The species of port wine which, in flavour, comes nearest to claret, is the only sort imported into this country; she likewise imports from Portugal the same kinds of merchandise which England procures from that country. Between Spain and Ireland there is a very flourishing trade; the commodities imported are similar to those, with which Spain supplies England; and the exports are of the same description, as the articles sent hence to Portugal. To Cadiz immense quantities of butter are annually exported. The Italian trade is generally tolerable, and Ireland draws almost every species of Italian commodities, as well as Levant merchandize, from Leghorn, and other parts of Italy. The returns are most of the exportable articles of this kingdom, particularly provisions, butter, and the like. The specification of the articles which constitute the commerce between Great Britain, and Ireland, will be found under the head of English commerce. Ireland has no export trade to the Baltic, and the vessels which are destined to procure the commodities of the ports on this

sea, are invariably sent out in ballast. There is scarcely any direct commerce between Germany and this country, and the German merchandize which finds its way into the Irish markets, passes, for the most part, through the ports of London, Liverpool, and Bristol. The vessels which proceed directly from Ireland to Holland, are usually in ballast; they bring home the same kinds of merchandize as England procures from the Dutch: the same may be said of the trade with Hamburg, Denmark, and Norway. With North America the trade is very extensive, more particularly as it regards the imports; for, if we except large quantities of linens, very few goods are sent from Ireland to America: one of the chief commodities imported from North America is flax-seed, of which Ireland purchases more than England herself; exclusively of provisions, butter and the like, the other imports from America are similar to those which will be found enumerated under the head of English commerce. Some small adventures, consisting for the most part of linens, have been sent to South America lately. The trade which Ireland carries on with the West Indies, is one of the most important branches of Irish commerce, and since the union of the kingdoms of England and Ireland, has been rapidly increasing: Dublin enjoys a great portion of this lucrative traffic. This city boasts one of the finest custom-houses in Europe; it is inhabited by most opulent and respectable merchants and traders of every description, and its places of commercial resort, such as the Exchange, Commercial Buildings, &c. are in point of magnificence and commodiousness, not to be excelled, or perhaps equalled, by similar institutions in any other part of the British dominions. The linen and hempen manufactures are carried on to some extent in this metropolis, the prosperity of which has been much promoted by the board of trustees, established by act of parliament, and by the National Bank, which was founded in 1783. Dublin has likewise manufactures of fine, and superfine broad, and narrow, woollen-cloths, calimancoes, serges, stuffs, poplins, tabinets; all sorts of silk articles, as lustrings, sarsnets, persians, silk handkerchiefs, &c.; all kinds of ribbons, tapes, and small wares: here are several sugar-houses, glass-houses for fine glass wares, as also for bottles, &c.; several distilleries; brewhouses for making porter, ale, and table beer; houses for slaughtering cattle intended for exportation to the West Indies, &c.; large manufactories of soap and candles, for home consumption and exportation; large iron mills in the vicinity, and several manufactories of coarse iron ware; several manufactories of toys, and all kinds of Birmingham wares; calico-printing; paper mills; manufactures of room papers; hosiery; musical instruments of all kinds: wax-candles, and super-

rior kinds of wafers, are also made here, besides cutlery equal to any in the world. The manufacture of cotton goods, established at Prosperous, near Dublin, has been in a thriving state ever since 1785, when Parliament granted 25,000*l.* to the proprietors. The greatest improvement to the trade of Dublin, is in the grand canal and floating dock, which form a water carriage from St. George's channel into the river Shannon, which falls into the Atlantic ocean, at the western side of Ireland, completely intersecting the whole kingdom; by this plan Dublin is enabled to supply almost every county in Ireland with the commodities which she imports, as well as with her manufactures, &c. The Dublin society is an institution, incorporated in the year 1749, for improving husbandry and other useful arts, and its establishment reflects honour upon the citizens; it triennially bestows premiums on such meritorious claimants as apply for them for useful improvements in arts, manufactures, and agriculture. Dublin is remarkably well supplied with flesh, fowl, and fish; the latter in much greater perfection than any other capital in Europe. It is supplied with coals chiefly from Cumberland, Scotland, and Wales.

Cork—is a great trading place; its principal export is salt provisions: during the slaughtering season, from August till January, there are about 100,000 head of black cattle killed. The wealth and grandeur of Cork arise from its capacious harbour, where almost any number of ships may lie with ease and safety; ships from England bound to the West Indies, take in here a great part of their provisions, and on the same account the haven of Cork is also visited by those of most other nations. Besides beef, Cork exports butter, candles, raw and tanned hides, linen cloth, pork, lambs' and rabbits' skins, tallow, wool, and worsted. The merchants of Cork carry on a very extensive trade to almost every part of the known world, and the number of ships that they now employ is treble what it was forty years ago, so rapid has been the increase of their commerce.

Waterford—employs upwards of 70 ships in the Newfoundland trade, and it is computed that 3000 hogs have been killed here weekly, and cured, chiefly for the supply of the royal navy. About 70,000 casks of butter are annually exported; besides which, the commerce in beef, corn, linen, &c. is very great.

Limerick. — The quays are roomy; the Shannon is navigable up to them for ships of 500 tons; at about $1\frac{1}{2}$ mile farther down to Pool, for ships of 900 tons; four miles above the city, the cataract of Doonass interrupts the navigation, but a canal has been made to open a communication with Kilmaloe, where the Shannon is navigable for small vessels 100 miles further.

In very early times, Limerick was visited

by foreign merchants, and from the invasion of the Danes to the 12th century, this city was the centre of an important commerce, and continued to be the second city in Ireland, till Cork, by a more convenient situation for foreign trade, acquired a pre-eminence.

The *Exports* consist chiefly of provisions, such as beef, butter, &c. besides raw hides, oats, some rape-seed, feathers, some checks, linens, linen-yarn, and hemp.

Imports. — Sugar, rum, timber for building, wine, coals, tobacco, glass from Scotland, salt from Liverpool, &c.

Formerly immense quantities of shoes were made here for the supply of foreign markets; but now the hides are exported raw.

Beautiful gloves continue to be manufactured here, which are celebrated in other places with the name of *Limerick Gloves*, in the town they are called *Chicken Gloves*; they are for the use of ladies, and notwithstanding the very high price of them, are worn in general only one night at fashionable balls; they are prepared to such fineness, that a pair may be drawn through a finger-ring. Similar articles are now made in Dublin, and perhaps in other places in Ireland, as likewise at Worcester, and sold under the name of *Limerick Gloves*.

Limerick or *Irish hooks*, are small and thin, with a peculiar curve; they are dearer than the common ones. In the English manufactories, the same sort of hooks are made, and called *Limerick hooks*.

Belfast has considerable manufactures of cotton, cambric, sail-cloth, and linen; and others of glass, sugar, earthen-ware, &c. Hence, too, large quantities of provisions and butter are exported.

Newry has a good export trade, as has *Drogheda*; and *Lisburn* is noted for its linen manufactory.

Clonmell has a considerable manufacture in the woollen branch, chiefly carried on by the Quakers, who are very numerous here.

Drogheda has a good export trade.

Dundalk, there is a considerable manufacture of muslins, linens, and cambrics: here is carried on a good inland and export trade.

The salmon and herring-fishery is carried on at *Galway* with great spirit, and employs several hundred boats; it has also a considerable trade in making and exporting kelp, and of late years, the linen manufactures have been considerably improved.

At *Hillsborough* considerable quantities of muslins are made.

Kinsale may be called the Plymouth of Ireland; ships of war are sometimes repaired at the docks of this port; it is much frequented by West Indianmen, and exports considerable quantities of grain.

Many important branches of the linen manufacture are carried on at *Longford*, whence

a great quantity of hemp is sent to the other manufacturing towns.

Sligo carries on a large trade with the northern parts of Europe.

Londonderry has also a good export trade, and some linen manufactures.

Wexford has several extensive woollen manufactures; and exports much corn: this town has not a good harbour.

The inhabitants of *Youghall* have a tolerable inland trade; and a manufactory of earthen-ware, some years ago established here, is in a thriving condition; the external commerce is not of any great importance, and the harbour is difficult of access.

Dungarvon supplies Dublin with large quantities of fish; as also with potatoes and birch-brooms in abundance, which are sent to the capital in boats; the latter articles are jocosely called *fruit*, and *timber*.

Carrick on Suir has long been noted for its manufactures of broad woollen cloths, and ratteens, which at the present day are in a flourishing state.

The inland trade of Ireland is of very great importance, and is principally carried on by means of the fine rivers which intersect the country; and by the navigable canals, of which there are two in this kingdom, that branch out in different directions, commencing their course at Dublin.

The following is the official account of the value of Irish imports and exports for the year ending January 5, 1821: —

Imports. Exports.

Including trade with

Great Britain -	5,167,014	7,179,222
Exclusive of same -	924,542	608,406

The following article is extracted from the Irish union act, and exhibits the footing upon which the trade between England and Ireland at present stands; together with the alterations decreed by parliament, to be made in the structure of the existing trade, as well as the periods, at which such alterations are to take place.

1st January, 1801.

“ Article VI. His Majesty's subjects of Great Britain and Ireland shall be entitled to the same privileges, and be on the same footing as to encouragements and bounties on the like articles, being the growth, produce, or manufacture of either country respectively, and generally in respect of navigation and trade, in all ports and places in the United Kingdom and its dependencies; and in all treaties made by his Majesty with any foreign power, the subjects of Ireland shall be upon the same footing with British subjects; all articles of export to and from either country, without any bounty or duty upon the same, and all former prohibitions and bounties on the export of articles, the growth, produce, or manufacture of either country, shall cease and determine; all articles, the growth, produce, or manufac-

ture of either country, not particularly enumerated as subject to specific duties, shall be imported into either country respectively, free from duty, other than the countervailing duties on the several articles enumerated in a schedule annexed to the act, or to such other countervailing duties as shall hereafter be imposed by parliament; and for 20 years from the union, the articles enumerated in the above schedule shall be subject, on importation to either country, to the duties specified therein; and the woollen manufactures known by the name of the *old and new drapery*, shall pay on importation into each country, the duties now payable on importation into Ireland; and coals, on importation into Ireland from Great Britain, shall be subject to burthens not exceeding those to which they are subject at present. Calicoes and muslins shall, upon their importation into either country, be subject and liable to the duties now payable on the same, on the importation thereof from Great Britain into Ireland, until the 5th of January, 1808; and from that period the duties shall be annually reduced in equal proportions, so as that the said duties shall stand at 10 per cent. from the 5th of January 1806, until the 5th of January 1808; and thenceforward shall be so reduced annually, that after the 5th of January 1816, all the duties on the said articles shall cease. Any articles of the growth, produce, or manufacture of either country, subject to internal duty, or duty upon the materials of which they are composed, shall be made subject, upon importation to either country respectively, to such countervailing duty as shall appear just and reasonable; and the articles specified in the schedule, shall be subject to the duties therein specified to be taken off, diminished, or increased, in the manner herein specified; and upon the export of the said articles from each country to the other respectively, a drawback shall be allowed, equal in amount to the countervailing duty now payable on such articles, on the import thereof into the same country from the other; and a drawback equal to such countervailing duty, in amount, shall in like manner be given on the export of every such article respectively, from the same country to the other. All articles, the growth, produce, or manufacture of either country, when exported through the other, shall be subject to the same charges as if they had been exported directly from that country of which they were the growth, produce, or manufacture. All duties charged upon the importation of foreign or colonial goods into either country, shall, upon their export to the other, be either drawn back, or the amount (if any be retained) shall be placed to the credit of the country to which they shall be so exported, so long as the expense of the United Kingdom shall be defrayed by proportional contributions.

Nothing in this act shall extend to take away any duty, bounty, or prohibition, which exists with respect to corn, meal, malt, flour, or biscuit; but all duties, bounties, or prohibitions, relative to the said articles, may be from time to time varied or repealed, as by the united parliament shall be deemed expedient."

Accounts are kept as in England, but the English coins are of value in Ireland as 15 is to 12; that is to say, the English shilling is of value 15*d*.

ITALY, for many centuries the mistress of the world in *arms*, became so latterly in *arts*; but the injury, which a war of unexampled continuance had inflicted upon her, seems to have been converted into confirmed ruin by the provisions of peace.

Venice and Genoa, which by means of their republican freedom had elevated themselves to the first rank of commercial cities, have been delivered over, bound hand and foot, to the capricious protection of a despotic power. The consequences are well depicted by the accounts of an intelligent traveller, recently written from these places respectively. Of Venice, he says, "the splendid place of St. Mark is no longer thronged by Venetian nobles, the cassinos are deserted, the famous Rialto bridge has ceased to be distinguished for its rich shops with their matchless brocades, the Bucentaur is rotten, and there is no longer a Doge to wed the Adriatic. The long-continued blockade of the English during the war annihilated the commerce of the port, and proved disastrous to the Venetian vessels. During many days, lately, only two vessels cleared out at the Custom-house, while several small craft were lying waiting for cargoes, with but little expectation of obtaining them. Under these circumstances the Venetians cannot but despair of the revival of commerce in this once celebrated emporium."

Of the commerce of Genoa, he writes, "the new government has established an increased tariff of duties here, on the effects of which I need make no observation. Many articles of consumption are to pay even six times more than they used to do. By virtue of the new regulations, all woollen cloths are to pay by weight, so that a coarse cloth of 5*s*. 6*d*. per yard, will have to pay as much as one of 56*s*. per yard; white cambricks, and cotton stuffs, which paid from four to five per cent. *ad valorem* duty, will now have to pay 15 per cent.; India long cloths which paid 3*l*. 6*s*. per piece, will now pay 13*l*. per piece. The duty on sheet iron is raised from 2*l*. to 15*l*. 10*s*.; and on other qualities of iron from 1*l*. 10*s*. to 15*l*. 15*s*."

Productions.—Italy is one of the finest and most beautiful countries in the world, and has been styled the garden of Europe. The

air is pure and serene, except in the Ecclesiastical State. The soil is, throughout, fertile, and produces exquisite fruits, and vegetables: it abounds in rice, corn, wine, olives, and oil.

The quantity of mulberry-trees cultivated here affords nourishment to an immense number of silk-worms, from which so much silk is obtained, as to constitute the chief article of the Italian export-trade.

Neither wool, flax, nor hemp, are scarce: mineral riches in general, and the finest marble in the world, are abundant.

Manufactures.—The industry of the Italians is principally exercised upon silks, stuffs, laces, confectionary, perfumes, and pastes of various kinds. In Sicily, Bologna, Genoa, Milan, and Piedmont, large quantities of silk are gathered. The sale and manufacture of the Sicilian silk rest entirely with the Florentines, the Genoese, and the Luccese. The silks exported from Italy are partly raw, and partly wrought. Milan furnishes wrought silks; Genoa raw silks; Bologna silks prepared for dyeing, called Bologna organzine, and raw silk; Parma, Modena, Lucca, and Reggio, raw silk. There is a sort of silk drawn from Bologna and Milan called *Miliorati*, in which the merchants of Amsterdam traffic. In Genoa are manufactured damasks, plain and figured velvets, tabbies, satins, taffetas, &c. The silk manufacture of Naples is in tolerable condition, and the mirrors of Venice still retain their credit for superiority.

Commerce.—The Venetians, and Genoese, long enjoyed the commerce of the southern coasts of Europe, and the Levant. Venice, Leghorn, Genoa, Trieste, and Naples, are the chief trading ports of Italy. Milan, Florence, Bologna, Modena, Reggio, Parma, and Lucca, also carry on some trade; but as these are inland towns, they must necessarily send their commodities for foreign export to the ports, through which likewise their returns must come. Some commerce with France, and the aforesaid inland towns, is however carried on by means of mules, which convey the commodities over the Alps to Lyons. Besides the merchandise peculiar to some parts of Italy, a quantity of others are to be met with in this country. The principal are dried fruits, raisins, figs, almonds, lemons, limes, aniseed, alum, sulphur, steel, rice, manna, amber, turpentine, cream-of-tartar, fine lac, paper, soap, essences, perfumed gloves, different sorts of snuff, white marble in squares and tables, also marble of various colours.

Of Venice and Genoa, as ports, we have said sufficient.

Leghorn—has a fine harbour, and still enjoys considerable trade. It supplies the interior with the produce of the Levant, and of Europe and her colonies generally. The principal imports are spices, dye woods,

coffee, tea, bark, alum, salt-fish, flour, flax, hides, iron, lead, rum, rice, sugar, tin, tobacco, tar, and woods.

Trieste—carries on a considerable commerce, as most of the foreign produce for the consumption of the Austrian states is drawn from thence. It is also a great depôt for the produce of the Levant. The imports and exports are much the same as those of the other ports of Italy.

Naples—imports vast quantities of salt-fish, colonial produce, and linens principally from Germany.

The exports are oil of the finest quality and in the greatest abundance, wine, wool of Puglia, staves of oak, and silk, both manufactured and unmanufactured.

At Rome, accounts are kept in scudi Romani, each scudo consisting of 10 paoli, and each paolo of 10 bajocchi.

At Naples, in ducati di regno, each ducato consisting of 100 grani.

At Venice, in lire, each lira consisting of 20 soldi, each soldo of 12 denari de lira.

NETHERLANDS, Kingdom of the. In the distribution of dominion which was made by the last peace, the Stadtholder of Holland was placed at the head of a new kingdom, comprising French and Austrian Flanders, and the United Provinces, under the title of "THE NETHERLANDS," of which Brussels is the capital. This is altogether one of the finest countries in Europe for commerce, producing all the necessaries of life in abundance, and having the means of conveying them to all parts of the Continent. It has now within its limits four of the greatest commercial cities and ports in the world, *viz.* Antwerp, Ghent, Amsterdam, and Rotterdam, besides several inferior ones, as Ostend, and others.

Antwerp—was 200 years ago the first commercial port in the North of Europe, but was reduced by the shutting up of the Scheldt, on which river it is situated. It is likely to recover all its ancient lustre; its central situation being convenient for supplying France and all Germany, and having a port capable of receiving ships of any burthen. The principal articles of export now are wheat, beans, clover-seed, and linens. Of import, all West India and American produce, rock-salt, French wines, and British manufactured goods; the duties on which latter, however, are oppressively high. That the trade is rapidly increasing, may be collected from the circumstance that the number of ships which arrived in the port in 1817 was 999.

Ostend—is a considerable town and port, and favourably situated for trade, as it communicates by means of canals with all parts of the Netherlands. The trade is much the same as that of Antwerp, but inferior in quantity. Tallow and hides may indeed be articles added to the export, as English

calicoes may to the import trade. There is a constant communication between the ports on the southern, and eastern sides, of Great Britain, and Ostend, as well by public, as by private, packets.

Productions.—The Low Countries are, in general, well cultivated; the soil produces grain, flax, hemp, hops, barley, fruit, and wool; and the mines yield coal. Rape-seed, or *colza*, is one of the richest productions of Flanders or Brabant. A vast quantity of oil is made from this seed at Brussels. Tobacco is also a production of these countries, as well as oak-bark, or tan. Several parts of the soil are well adapted to the manufacture of delft and tobacco-pipes. Coal-mines, of an apparently inexhaustible nature, are found in the Netherlands, the coals drawn from which are readily bought up by the different manufacturers residing in the towns and cities.

Although the riches of Holland originate rather in its commerce, than its soil, yet agriculture is flourishing in some of the provinces.

Corn.—There is not a sufficient quantity of grain grown in Holland to answer the hundredth part of the demand of the inhabitants, nevertheless this country is denominated the granary of Europe, and in fact it furnishes Spain, Italy, France, and occasionally even England, with corn. The places whence the Dutch draw their grain are Poland, Elbing, Königsberg, Flanders, and what they call the High Countries.

Flax.—There are three sorts of flax in Holland, *viz.* the flax of the country itself, that of the High Countries, and that of foreign countries. All these kinds are either raw or spun, and they are all subject to different duties, according to their respective species and qualities.

Wool.—Very little wool is exported from Holland, and what is obtained from the sheep of the country is chiefly consumed in the manufactures. The ancient race of sheep of the seven United Provinces has totally degenerated since the introduction of Asiatic sheep.

Wax.—A vast quantity is annually gathered in Holland, and the bleaching of it forms a considerable branch of industry among the poorer classes. A great deal of white wax is sent hence to Spain; it is packed in large cases, each of which weighs from 400 to 500 lbs. The best kind of this wax is called royal wax.

Fish.—without exception, gives rise to the most important and ancient branch of commercial industry in this kingdom. The principal fishery is that of herrings. The Dutch herrings are more tender, of better flavour, and are less salted than the English. They are divided into three classes, namely, herrings prepared in fine salt; herrings cured in coarse salt; and empty herrings, as they

are called, which sell for one-third less than the last-mentioned sort. The time of departure for the fishery is about the 24th of June. The cod-fishery commences in October, and ends in April; it is carried on upon the Dogger Bank. This fish is prepared and salted at sea; it is somewhat similar to the Newfoundland fish, and not only serves for the consumption of Holland, but forms one of its chief exports. The whale-fishery was formerly vested in a company, called the Northern Company; at present it is free, and is chiefly carried on upon the coasts of Nova Zembla, as far as Davis's Straights, and upon those of Spitzbergen, Greenland, &c. Each vessel takes with it four, five, six, or seven boats, and to each boat are allowed six or seven men. The vessels destined for Davis's Straights depart about the end of February, and those for Greenland about the end of April, or the beginning of May. They distinguish the whales into two sorts at Amsterdam; namely, finned, and cut whales.

Manufactures.—At Amsterdam are made stuffs, embroidered with gold and silver, damasks, brocades, taffetas, mohair, silks, velvets, velverets, velveteens, &c.; at Haarlem are made stuffs in imitation of those of Lyons; at Leyden and Utrecht woollen stuffs are manufactured, and in many parts of the kingdom linen-cloths of various qualities. Flanders lace continues unrivalled, and Brussels carpets and tapestry are too well known to need panegyric.

The following article, which we extract from "A Report of the Minister for the Interior, to the King of Holland," dated Utrecht, June 28th, 1808; after a public exhibition of sundry specimens of national industry, produced in Holland, will convey a tolerably just idea of the present state of the woollen manufactures in that part of the Netherlands kingdom.

"The amelioration of Dutch wool is, without doubt, an object of the utmost importance to the cloth-manufactories in this kingdom. The advantage arising to these manufactories in being able to procure this article (at least a great quantity of it) within the country itself, added to many proofs of its good quality, must certainly tend to eradicate those prejudices, which are still maintained by a great many persons, against using Dutch wool. Several land-owners apply themselves more and more to improve the wool of their sheep, by crossing their breed with the Merinos, the result of which experiment fully answers expectation. The specimens sent from the greater number of cloth-manufactories in the kingdom, give the most incontestible proofs that this branch of national industry, formerly so flourishing, continues to be of the greatest importance. A larger consumption of fine wrought Dutch wool, with the introduction of improved machinery, will restore

to this part of our manufactories all its former lustre, in which case our cloths will easily vie with those made in foreign countries, as well in respect to price, as to quality. In this exhibition, so truly honourable to the Dutch nation, the Leyden cloth-manufactories certainly deserve the first place. The durability, beauty, and excellent quality, of the Leyden cloths, have been universally acknowledged during a number of years. The beautiful pieces of cloth, as well as of kerseymere, which have been sent to the exhibition by the manufacturers themselves, and also by the commissioners of the cloth-hall, confirm and even increase the old and well-founded celebrity of those manufactories. They are moreover so many proofs, that even, at the present time, cloth is manufactured in that city, which is comparable to the best that is made in this, or in any other country. These manufacturers having sent in the produce of their manufactories collectively, have rendered the distribution of prizes among them extremely difficult; and the commissioners have therefore been constrained by necessity to content themselves with simply mentioning the Leyden cloth-manufactory, in a most distinguished and honourable manner. But although the city of Leyden is justly to be considered as the emporium of the woollen-cloth manufactories, there are, nevertheless, places in other parts of the kingdom, where this branch of national industry is in a very flourishing state; and which possess manufactories, the produce whereof has attracted general notice.

“The blanket and frieze-manufactories, which particularly belong to this country, and wherein no other nation will readily dispute with us the precedence, continue still to be in a flourishing state. The different specimens sent in by the manufacturers of Leyden, in which city this important branch of Dutch industry is particularly established, are sufficient proofs that those manufactories, far from falling into decay, continue to maintain their ancient reputation, and have even increased it by new inventions. They are the more important, as the raw material is the produce of our native country; to which cause the continuance of their prosperity may be justly attributed.”

The remainder of this important official Report, which consists of a statement of the present condition of the manufactures of carpeting, floor-cloth, hats, wrought silks and velvets, hemp, flax, cordage, thread, calico, paper, leather, iron, copper, wrought silver, &c. presents a most favourable picture of the progress made in these different branches of industry by the Dutch.

Amongst the manufactories of Holland may be enumerated the sugar-houses, as well as numerous manufactories of camphor,

vermilion, sulphur, borax, lapis lazuli, pitch, tar, rosin, spermaceti, salt, tiles, and clinkers, which are spread throughout the country. Those of salt supply the Austrian provinces, the country of Liege, and some other parts of Germany. The oil-mills, and mills for cutting wood, are very numerous. A large branch of Dutch industry consists in the construction of ships. The yards for ship-building belonging to the Admiralty, and to the East India Company, are very considerable, and those of Saardam, in which Peter the Great served his apprenticeship, are still more so. The cordage made in Holland is very good, nevertheless the Dutch draw from Memel, Riga, Königsberg, and Russia, great quantities of the article. The manufacture of paper is immense, as is the export of that article. Porcelain is made at Weish; but though it is very beautiful, it does not contribute to the commerce of the kingdom. The delft, made at Delft, has formerly been celebrated throughout Europe, yet what is made here now barely serves to supply Holland, and a few of the neighbouring States. The preparation of diamonds, that is to say, the cutting, polishing, and grinding of these precious stones, is confined to Amsterdam, where many artists are employed for the said purposes. The manufacture of skates is also of some consequence in this country. That species of spirits, so well known under the denomination of Geneva, or Hollands, is distilled from corn, and the quantities of it which are annually exported from Holland, for Germany, England, &c. are indeed immense.

Commerce. — The commerce of Holland is so very extensive, that we shall class each branch under a separate head. Formerly the East India Company of Holland might with justice be denominated the first, but at present it is nearly annihilated.

A West India Company was established in 1621, which has lasted till the present time. This company sends to its settlements coral, crystal, looking-glasses, knives, scissors, hatchets, coarse laces, linen, strong liquors, &c. and in exchange receives ivory, skins, gums, and a large quantity of gold, &c. &c. This company also engrosses the Dutch commerce with Africa, whither it sends hardware, in return for which it receives gold, ivory, skins, gums, and rice. Another advantage which it possesses, is that no vessel can bring salt from St. Ubes, without the permission of the company.

Commerce with the Levant and the Mediterranean. — The merchandise, which the Dutch send to the Levant and the ports of the Mediterranean, are, all sorts of spices, cocoa, ginger, tea, porcelain, painted linens, silks, satins, damasks, muslins, cambrics, fine Holland linens, besides those of Silesia and Osnaburgh; Dutch and English cloths, camlets; serges, white thread of Haarlem

and Flanders, tapes of Haarlem, narrow woollen-stuffs, vermilion, all sorts of dye-woods, elephants'-teeth, madder, Russian skins, whale-fins and oil, copper, brass, iron, lead, pewter, pitch, tar, rosin, musk, amber, mercery, hardware, salted and smoked herrings, salmon, tin, steel, &c. In return, the Dutch receive, from the Italian ports, all the various produce of that country (*see title ITALY*); from Palermo, the capital of Sicily, silks, sulphur, cream of tartar, fine sponges, &c.

Smyrna is the most trading, and the best peopled, port upon the Mediterranean; hither the Persian caravans and the vessels from the Islands of the Archipelago come, and hence the Dutch draw silks, muslins, cottons, camels' hair, rhubarb, Tartarian scammony, galbanum, tutty, various kinds of gum, and a vast quantity of other kinds of drugs; also maroquins, Cyprus cotton, currants from Zante and Cefaloniam, mastic, corn, Angora goats' hair, opium, senna, coffee, yellow wax, alum, raisins, fine camels, coarse Turkey grain, fine Metelin wool, buffalo-hides, sponges, mastic, saffron, galls, ashes for bleaching, shagreen, box-wood, aniseed, fustians, carpets, and various other kinds of merchandise. In return the Dutch send to Smyrna fine green, purple, scarlet, crimson, and violet cloths, all sorts of spices, ginger, cochineal, indigo, copperas, quicksilver, wire, Dantzick steel, English pewter and lead, yellow amber, tartar, morse-teeth, lapis lazuli, loaf-sugar, cassonade, red-lead, logwood, tin, Russian skins, Hungarian ducats and pieces of eight. From Constantinople the Dutch draw (either directly, or *via* Smyrna and Leghorn) goats' hair, camels' hair, silks, salted hides of oxen and buffaloes, sheepskins, box-wood, aniseed of Gallipoli, spun and raw cotton, alum, rhubarb, scammony, camlets, benjamin, mastic, caviar, beautiful carpets, &c. &c.; from Alexandretto and Aleppo, galls, fine Turkish and Persian wools for the manufacture of hats, pistachio nuts, dates, yellow wax, spun and raw cotton, coloquintida, all sorts of silk, shagreen, painted linen, Persian carpets, ambergris, pearls, goats' and camels' hair, senna, adra-canth, and gum-arabic, calamus, labdanum, galbanum, and drugs of various sorts, soap, kelp, incense, myrrh, maroquins, painted and embroidered handkerchiefs, Mecca balm, &c.; from Alexandria, coffee, dried ox-skins, linens, fustians, flax, incense, myrrh, saffron, gum-arabic, spun and raw cotton, sal ammoniac, curcuma, &c. &c.; finally, from Grand Cairo and Rosetta the same sorts of merchandise as from Alexandria.

Commerce with the North and the Baltic.

— The Dutch vessels, for a considerable period, frequented the ports of Revel and Narva, in order to traffic with the Russians: at present they chiefly visit those of Arch-

angel. These vessels set out in the following order, *viz.* five or six about the beginning of May, returning towards the end of September; the remainder depart about the beginning of June, returning in October. The Dutch vessels generally contrive to reach Archangel about the time of the fair, which commences on the 1st of September. The species of merchandise carried thither are, golden ducats, rix-dollars, paper, silk-stuffs, woollen-cloths, Canada beavers, spirits, wine, pewter, lead, white-lead, indigo, dyeing-woods, incense, sulphur, copperas, spices, mercery, hardware, herrings, pearls, diamonds, gold and silver wire, laces, toys, &c. The returns are, all sorts of skins and furs, masts, corn, rye, pitch, ashes, Russian skins, salted and dried hides, tallow, candles, bees'-wax, hogs'-bristles, whale-oil, seal-skins, isinglass, caviar, anchovies, salted and smoked salmon, &c. &c. The Dutch also carry on a similar traffic, but to a less extent, with Petersburg, and indeed with all the ports of the Russian empire. The Dutch commerce with Norway is considerable, and 150 vessels are annually cleared from Holland for that country. The principal sorts of merchandise brought from Norway are masts, deal planks, pitch, tallow, ship-timber, goat-skins, dried fish, wood for fuel, cinders, &c. The commodities, for which the said returns are made, are golden ducats, rix-dollars, wine, spirits, vinegar, salt, spices, sugar, rice, almonds, raisins, prunes, tobacco, cheese, woollen-cloths, baizes, serges, some silken stuffs, woollen and cotton stockings, dye-woods, &c. The commerce with Denmark is less considerable than the foregoing; the commodities sent thither are similar to those exported to Norway, and the returns consist of masts, planks, pitch, tar, tallow, ox-hides, goat-skins, dried fish, flax, hemp, copper, iron, ashes, corn, and a large quantity of lean Jutland oxen. The Dutch send to Sweden the same kinds of merchandise as to the two foregoing States, and the returns are copper, esteemed the best in Europe, iron, brass-wire, warming-pans, copper basons, iron pots and plates, brass and iron ordnance, bullets, balls, steel, fire-arms, lead, copperas, pitch, tar, masts, planks, beams, rafters, and small vessels built of fir. Besides Denmark and Sweden, the commerce of the Baltic includes the trade with Livonia, Courland, Prussia, Pomerania, Mecklenburgh, and the duchies of Holstein and Sleswick.

Commerce of the Elbe, the Weser, the Ems, the Rhine, and the Meuse. — The Elbe is celebrated on account of the commerce carried on with Hamburg, which is situated at a distance of twenty leagues from its mouth. The Dutch carry to Hamburg, spices, drugs, mercery, sugar, olive-oil, herrings, &c. and receive in return wood, corn, honey, wax, tin, brass-wire, copper in sheets,

&c. &c. Bremen, which is situated upon the Weser, engrosses the commerce of all the countries which this river waters. The Dutch carry thither cloths, stuffs made from wool and silk, dye-woods, drugs, herrings, wines, brandy, &c. In return they receive iron-furnaces for the sugar-houses, &c. iron-mongery of almost every description, wood, potash, honey, wax, coarse cloths and serges, Brunswick beer, or *mum*, wool, aniseed, down, writing-pens, linens, and grain. The whole commerce of the river Ems is carried on by Embden, which is a mercantile town of good repute, has an excellent port, and furnishes Holland with lean oxen, horses, Westphalia hams, linens of Munster and Paderborn; in return for which it receives the same kinds of merchandise as the Dutch send to Bremen. The Rhine, and the several rivers which communicate with it, afford the Dutch an opportunity of supplying the greater part of Germany, and even Switzerland, with spices, drugs, refined and raw sugar, herrings, dried fish, olive-oil, woollen and silken stuffs, ribbons, gold and silver lace, silk, thread, dye-roots, cheese, butter, dried fruits, soap, cottons, muslins, cambrics, coffee, tea, chocolate, and porcelain. The returns to Holland are, the wines of the Rhine and Moselle; iron-cannons, balls, grenadoes, carcasses and bombs, beams and planks of oak, earthen-ware, slates, and square stones for roofing the houses. The town of Coblenz, situated at the confluence of the Rhine and Moselle, furnishes Holland with wine, wood, Lorrain iron, &c. Cologne is the chief commercial port of the Rhine. From Frankfort on the Maine a considerable commerce is carried on with the Dutch, who send thither plain and embroidered stuffs, silks, cloths, and woollen stuffs, lace, ribbons, gold and silver lace, thread, hats, gloves, pins, needles, all sorts of Indian commodities, spices, drugs, dyes, pewter, lead, copper, &c.; and in return for which they receive wool, Italian silks, leaf-tobacco, potash, tartar, sulphur, &c. A commerce nearly similar to the foregoing is carried on between Holland and Leipsic. The commerce of Berlin is conducted through the medium of Ham-burgh, and consists, on the part of the Dutch, in the export of silken stuffs, cloths, gold and silver lace, dyes, spices, drugs, muslins, cambrics, painted linens, laces, &c. and on the part of Prussia in steel and mirrors. Liege is the chief commercial place on the Meuse; the Dutch send thither woollen and silken stuffs, muslins, painted linens, dyes, spices, drugs, wines, spirits, and some other kinds of merchandise; in return for which they receive serges, coarse cloths, ribbons, horse-hair, alum, iron in bars and rods, iron-nails, screws, fire-arms, iron cannons and mortars, bullets, balls, iron pots, all sorts of mercery, steel, and hardware, sole-leather, slates, and coal.

Commerce with Spain. — The Dutch carry on a considerable traffic with Spain, particularly with Cadiz, whither they carry linen cloth of every sort, table-cloths, sail-cloth, twine and cables, muslins, cambrics, laces, gold and silver lace, woollen cloths and stuffs, silks, gauzes, ribbons, sewing-thread, fans, hogs'-lard, velvet, silken and woollen stockings, mercery, ironmongery, spices, drugs, cocoa; and (occasionally) grain, wood for ship-building, pitch, tar, ships built and rigged, paper, playing-cards, Russia skins, all kinds of military stores, herrings, salmon and other salted fish, butter, cheese, &c. &c. From Cadiz the Dutch draw gold and silver in bars, logwood, cochineal, cocoa, tobacco, quinquina, sarsaparilla, balsam of Peru, and a quantity of other sorts of Peruvian drugs, dried hides, precious stones, wool, wine, fruit, olives, olive-oil, salt, soap, kali, iron, steel, &c. From Bilboa the Dutch procure a quantity of Spanish wool, besides wines, brandy, chesnuts, prunes, hams, turpentine, rosin, pitch, honey, bed-feathers, and flax-seed. From Lyons, gold, silver, and silken stuffs, ribbons, and taffetas. From Marseilles, wines of Saint Laurent, brandy, olives, olive-oil, capers, anchovies, virgin-honey, almonds, figs, Zante currants, tunny, all sorts of Levantine and Arabian drugs, coffee, white and marbled soap, verdigris, perfumery of Montpellier, laces, silk-stockings, silk, cotton raw and spun, Angora goats' hair, camels' hair, and various other sorts of merchandise.

We have been the more minute in noticing particularly and specifically the countries with which the subjects of the Netherlands kingdom carry on their commerce, as well as the articles of which it is principally composed, because they have been the great commercial rivals of the English, and are making extraordinary exertions to become so again.

Accounts are kept at Antwerp and Brussels in guldens or florins, each consisting of 20 patars, and each patar of 12 pennings. At Amsterdam in guldens, each consisting of 20 stivers, and each stiver of 16 pennings.

NORWAY, after having been united to Denmark for 500 years, was allotted to Sweden in the distribution of territory awarded by the last peace of Europe. Christiana is the present capital of Norway, but Bergen is the first commercial city. Drontheim was formerly the capital, but is much declined; however, it is now in some degree recovering itself, and has lately become somewhat celebrated for its trade in stock-fish, herrings, fish-oil, skins, and copper, which latter article abounds in the immediate neighbourhood, at a place called Rocraas. The lichens flourish particularly about this part of Norway, and the people have been lately taught to extract from them a valuable colouring material.

The productions are grain, wood, fish, beasts, and minerals; but the wood, fish, and produce of the mines alone contribute to the external commerce of the kingdom.

Wood. the chief source of riches to the inhabitants of Norway, and by supplying fuel for the working of the produce of the mines, and materials for the construction of the fishing and other vessels, may be said to form the basis of its commerce and industry, and to be the cause of attracting the vast number of vessels which frequent the Norwegian ports. Sydenfeld produces the most wood of any part of Norway. The trees which are cut down here for export trade have been estimated at an annual sum of 500,000*l.* sterling; in which computation are not included those cut down for home consumption, or for ship-building, and the construction of houses. The red fir-tree is the most common, and the most useful, of Norwegian trees; its close and resinous fibres render it supple, and at the same time durable, whilst the air, so far from injuring, indurates it. It is from Frederickstadt that those enormous beams, known by the appellation of *lod bielker*, are drawn, as are other round and flat pieces, from 50 to 100 feet in length, and deal planks an inch to three inches in thickness, from 10 to 14 feet long, and 8 to 12 inches in width. Christiana furnishes the best planks, but from all parts of Norway wood is exported. The qualities of the Norwegian wood render it peculiarly useful to the Dutch, who make use of it for piles, and in the construction of their dykes. It is at Christiansund and Acudahl that oak is met with; it is well adapted for ship-building, and is justly esteemed the best of the northern woods. Arendahl is the chief place for the construction of vessels made from this wood, which forms the sole object of its inhabitants' industry; inasmuch that the whole town wears the appearance of an immense dock-yard.

Mines. — There are several; those of iron and copper are the principal. There are also some silver mines; and a gold mine at Egswold, from the produce of which some very beautiful ducats have been made. Copper is one of the principal articles of Norwegian merchandise; the mines whence it is drawn are situated seven or eight leagues from Drontheim, adjacent to the village of Steckbi. Iron, next to wood, is the most important of Norwegian commodities.

Commerce. — The Dutch carry to Norway grain, wine, brandy, vinegar, salt, all kinds of spices, sugar, rice, almonds, raisins, plums, tobacco, cheese, cloths, and every description of woollen and silken stuff. The returns are masts, deal planks, tar, tallow, goat-skins, ship-timber, cleft-wood for making casks, dried fish, copper

wood for buildings, &c. and potash, alum, and vitriol, as also woollen stockings.

POLAND. — *Productions.* — Many forests of fir, pine, beech, and oak, are to be met with in Poland, and this country also produces honey and wax. The feeding of oxen is an important object with the Poles, and these useful animals constitute one of the chief articles of their export trade. The kingdom abounds in horses, which are strong, swift, and beautiful.

Mines and Minerals. — Antimony is found in the Crapaak mountains, but not in large quantities; indeed the major part of that which is made use of in Poland comes from Hungary. Quicksilver runs spontaneously at certain seasons of the year from the mountains, situated six miles from Cracow; as likewise from those in the vicinity of the town of Baligrod in the palatinate of Russia. Iron-mines are very numerous in this kingdom; the most famous are those in the neighbourhood of the town of Kouskia, and near Stomkorgow. At Kouskia beautiful pistols and muskets are manufactured; and a vast deal of lead-ore is dug and melted both at Olkusz and Ziel. The Polish lead is more brittle than the German. There are a great many kinds of earth in Poland, such as yellow earth, brown ochre, red ochre, and chalk. Poland also produces marble, alabaster, onyxes, agates, chalcedony, opal, jasper, rock-crystal, amethysts, granites, topazes, and sapphires. The mountains of Crapaak contain rubies and diamonds, which resemble those of Bohemia. A great deal of salt-petre and alum is prepared in Poland, and sent to Dantzick. Vitriol, naphtha, and asphaltos are found in several parts of the kingdom. There is likewise a sort of yellow amber found in the earth, and a still greater quantity of it in the lakes. Coal is to be met with near Tenin, and near the town of Dobrin, on the borders of the Vistula; but no use is made of it. There are inexhaustible mines of salt in the palatinate of Cracow, near the town of Wielitska, in which the salt is hewn down in large pieces. Two kinds of salt are found here, namely, brown opaque salt, and that which is white and transparent, called crystal salt. It is reduced to small lumps, and packed in tons for exportation.

Manufactures. — There are but few manufactures and handicrafts; indeed scarcely any, if we except a little pottery, a few woollen cloths, and a fabric of coarse linen-cloth, which serves as clothing for the miners, and at Dantzick cordage and cables. There are glass-houses in the Palatinate of Cracow, and in other parts of the kingdom. At some places situated upon the confines of Russia, Russian skins are prepared, and at Dantzick ox-skins, and particularly sole-leather, which is sent to foreign

countries. In various places upon the borders of Turkey are manufactured maroquins, which come very near those of Turkey, and are generally known under the name of *Turkish maroquins*.

Commerce. — The exports of Poland are grain, particularly rye, oats, and millet, which are conveyed by the Vistula to Dantzick. This forms the chief traffic of the town. The other Polish exports are hemp, flax, flax-seed, hops, pitch, rosin, pot-ash, masts, planks, beams, wood of all sorts, horses, oxen, sheep, pigs, ox-hides, the skins of elks, roe-bucks, sheep, and goats, Russian skins, maroquins, bear-skins, tallow, wool, feathers, wax, honey, mead, beer, distilled waters, mineral salt, saltpetre, vitriol, lapis lazuli, lapis calaminaris, lead, iron, copper in small quantities, coal, glass, pottery, &c. All these species of merchandise, small in number or value, do not bring much money into circulation in Poland, in consequence of their being paid for by means of other manufactures and commodities of England, Holland, Spain, France, Italy, Hungary, Denmark, and the Baltic. What money the Poles do receive, is expended in the purchase of wines, particularly those of Hungary, which they highly esteem. They receive these wines by way of Mount Crapaak, in large tubs, drawn by oxen, which convey them to Cracow, whence they are sent to other parts of the kingdom. Some of the wines of Italy are also consumed in Poland; and, by the Baltic, small quantities of French and Rhenish wines are brought hither. The other merchandise brought into Poland are, spices of all sorts, vast quantities of which the Poles consume; English and Dutch cloths; woollen stuffs, stuffs made of goats hair and of silk, manufactured at Brandenburg, in France, Italy, England, and Holland; the linen-cloths of Holland, Silesia, Lusatia, and other places, besides precious stones, gold and silver articles, valuable furs, salted fish, olive and whale oil, brass, steel, copper, pewter, with different articles made from these metals, and finally East, and West, India produce. The coffee trade there as in Poland is almost wholly in the hands of the Jews. After a time it is probable every thing relative to the commerce of this country will follow the fortunes of those states to which its different provinces are now become appendages, viz. Russia, Prussia, and Austria. The Russian portion, in which is Warsaw, the ancient capital, still preserves the name of a kingdom, of which the emperor of Russia is the sovereign. That part allotted to Prussia is called the duchy of Posen, from a considerable town of that name. The Austrian part is denominated the kingdoms of Galicia and Lodomeria. Cracow belongs not to any of these divisions, but is made a free city under the guaranty of

all the three powers. The emperor of Russia, in his quality of king of Poland, has instituted two annual fairs at Warsaw, one in May, the other in November, which may be the means of promoting some commerce in the kingdom. In Poland Proper, accounts are kept in zloti or florins, each florin consisting of 30 grosz, each grosz of 12 pfenings.

PORTUGAL. — Productions. — The soil of Portugal is tolerably well cultivated. It produces wool, silk, wines, oil, grain, cork-wood, and excellent fruits; but the country is so mountainous and rocky, that many parts will not repay the pains of the cultivator.

No land remains fallow in the valleys; nevertheless there is but little corn grown throughout the country. The culture of the potatoe is rapidly spreading.

Wines — are the most important of Portuguese productions. The only wine which forms an article of considerable export from Portugal is that called Port wine; great quantities whereof are shipped from Oporto, principally for England. An idea of the extent of this traffic may readily be formed from the following statement of the quantity of wine shipped from Oporto in 1800, before the vineyards had suffered from the devastations of war, 54,210½ pipes were shipped, whereof 53,511½ pipes were for the British dominions. From Lisbon are annually shipped about 10,000 pipes of Lisbon and Calcavella wines, both of which are the produce of Portugal.

Brandy — is made in many parts of Portugal, and large quantities are used in the making up of the wines; and for some of it they get a vent in Africa; but European nations seldom, if ever, purchase any, on account of its indifferent quality; neither do their own settlements in America consume much of it, being amply provided with an excellent substitute in their rum and arrack.

Oil. — Almost every part of Portugal produces oil, whereof a vast deal is consumed in the preparation of food, and the manufacture of soap. The oils of this kingdom are in general inferior to those of Italy and France: a considerable quantity is bought up by the English. It is estimated, that between 2 and 3000 tons of oil are annually exported from Oporto, as well for England, as for Brazil, &c. A small quantity is also exported from Lisbon and Aveiro.

Fruit. — The sorts of fruit exported from Portugal are figs, oranges, and lemons. The growth of figs is almost entirely confined to the kingdom of Algarva, where that species of fruit is very abundant, and in quality far superior to those of Spain and Barbary. The English, the Dutch, and the Hamburgers, repair to Faro and Larghos, where they purchase figs in large quantities. Almonds grow in Algarva, but very few are

exported; the Portuguese use them principally as fodder for their pigs, and to this mode of feeding, the hams of Portugal owe their celebrity. The oranges and lemons are inferior to those of Spain, their rinds being thick, and their substance but small, nevertheless great quantities of these fruits are sent to England, Holland, and France. The greater part of the oranges and lemons grow spontaneously throughout the country, situated between Aveiro and Lisbon, from both which ports, as well as from Oporto, they are exported.

Honey.—A great deal is collected in the environs of Evora, Torres Vedras, and Abrantes, in the province between the Douro and Minho, and in the country around Orique.

Silk.—For the purpose of rearing silkworms, mulberry-trees are cultivated in most parts of Portugal. The silk is in general of good quality, and in order to give life and encouragement to that trade, the export of the raw material is prohibited.

Mines and Metals—are numerous and abundant in Portugal; there are very few of the rivers in which grains of gold are not to be found, and as few mountains which do not contain mines. In addition to many gold mines, Portugal formerly possessed several diamond mines, which disappeared during the earthquake of 1755. This kingdom produces a great deal of salt, which is exported from Saint Ubes to most of the northern nations. In a creek upon the western coast, near Aveiro, much is manufactured for exportation. The Portuguese salt has the peculiar quality of preserving provisions better than that of any other nation. Iron ore is very scarce in Portugal; the only mine known is that situated in the province of Tra-los-Montes. A species of flint of excellent quality is found, in loose pieces of a foot, or a foot and a half, in thickness, in a reddish sand, in the neighbourhood of Azenheira, in Estremadura. This stone is made into musket-flints, of which vast quantities are bought up both by the government of Portugal, and that of Spain, for the use of the armies. They are carried on mules, like all other goods, and are sent as far as the interior provinces of Spain.

Manufactures.—There are cloths made in several towns, particularly at Lisbon, but they are very coarse; and indeed Portugal procures almost all her fine cloths from England. There are some silk manufactures in Portugal. The silken-stuffs of this country, though inferior to those of Spain, are far from being bad, in respect to quality. Hats are made at Lisbon, but this manufacture is not very extensive; the Portuguese furnish themselves, for the most part, with hats from England. The manufacture of soap is of some importance. The

Portuguese not only make a sufficient quantity for their own consumption, but likewise for that of Galicia and the other neighbouring Spanish provinces; they also export a great deal of soap to Brazil, and to their African, and Asiatic, settlements. There is a large glass manufactory in the province of Beira, but it produces very indifferent glass.

Commerce.—The commerce of Portugal is of two sorts, namely, that carried on with its own possessions, and that with the other European nations. The Portuguese do not carry on any considerable traffic with the different nations of Europe in a direct manner: the English, the French, Dutch, Germans, Danes, Swedes, Spaniards, and Italians, have houses and consuls established at Lisbon. The English have likewise a factory at Oporto, and inferior establishments at Ucana, Figueira, Favo, and in the island of Madeira.

With England, Portugal has hitherto carried on her greatest trade; on the part of England, that principally consists in the exports of baizes, shalloons, Norwich, Manchester, and Coventry goods, linens, printed calicoes, silken and woollen stockings, water-tabbies, the hardware of Birmingham, Sheffield, and Wolverhampton, manufactured silver, pendulums, watches, clocks, lead, shot, copper, pewter, coal, salted beef, pork, fish, and butter, grain, flour, biscuits, hoops, pipes, and all sorts of English manufactures. The commerce with England is far from being disadvantageous to Portugal, because the vast quantity of wine, lemons, and oranges, which the latter furnishes to the former, causes the balance of commerce in favour of England to be trifling. The English merchants enjoy many privileges in Portugal, and exemptions from the payment of many duties for the articles consumed by themselves and families.

The commodities brought to Portugal from the Baltic, are hemp, flax, Russia skins, Russia sheetings, sail-cloth; manufactured, bar, and cast iron, copper, wood for ship-building and other purposes; corn, rice, and barley in large quantities, wax, stockfish, pitch, tar, &c. The exports for Hamburgh and other northern ports, consist of salt, sugar, tobacco, whale-fins, wine, lemons, oranges, figs, cocoa-nuts, coffee, cork-wood, &c. The balance of trade is unfavourable to Portugal.

The Portuguese have possessions in Africa, India, and America. Formerly their African colonies extended from Tangier and Ceuta to the Red Sea. At present their settlements in Africa are Mazagan, in the kingdom of Morocco, factories upon the coast of Guinea, and in the kingdom of Congo, some forts at Melinda, Mozambique, &c. the latter being the place of residence of a Portuguese Governor Gene-

ral. They are the only Europeans, who, in conjunction with the Arabs, carry on commerce with Sofala, Mozambique, and Melinda, upon the eastern coast of Africa: this traffic yields immense profits, particularly that of Mozambique, which is rated at nearly cent. per cent., and hence it is not inapily called the Peru and Chili of Portugal. It is here, too, that the gold of Monomotapa is exchanged for European and Indian commodities. The Island of St. Thomas, on the coast of Guinea, furnishes them with sugar of good quality. Besides their possessions on the African main, the Portuguese possess the Islands of Madeira and the Azores, Cape de Verd Islands, and those upon the coast of Guinea, whence they draw wine, fruit, &c. &c. In Asia the Portuguese possessions are the towns of Goa and Diu, extremely well situated for commerce, Macao in China, and some inconsiderable settlements upon the coast of Malabar. Only one or two vessels of about 200 tons burthen annually depart from Lisbon for Goa: the greater part of the cargo is money. The same sort of cargo is sent to the other parts of India, together with some corn, brandy, iron raw and manufactured, laces, hats, skins, &c. &c.

For the Portuguese kingdom of Brazil, see title AMERICA.

Accounts in Portugal, as well as in Brazil, are kept in Reis, and Milreis.

PRUSSIA.—*Productions.*—Eastern Prussia is fertile in grain of all sorts. Bristles and wax form not only part of its productions, but likewise of its exports; but the most valuable commodities of Eastern Prussia are horses. Here is an immense stud of them, whither many people repair to purchase stallions. Sheep are likewise bred here, but the exportation of their wool is prohibited. The culture of silk is prosperous in Pomerania, and some is also gathered in Neumark; this last province also furnishes wool, which is made use of in the manufactures of the electorate of Mark. Besides the ordinary productions of grain, fruit, &c., Silesia produces madder of a middling quality, saffron in small quantities, with tobacco and wood. But these are as nothing in comparison to the flax, which this vast province produces, and of which is made linen-cloth, the sale whereof proves highly productive of riches to the kingdom. The wools are a no less precious production of Silesia; and it is computed that two millions of beasts, yielding wool, are bred in this province. The exportation of flax is not permitted, unless the crop prove very abundant, and that of wool is totally prohibited. This province likewise contains immense forests, in which grow pines and other trees, whence are procured pitch and tar; beech grows prin-

cipally in the territory of Jagerndorf, and hence large quantities of turpentine are likewise drawn: the oak flourishes upon the banks of the Oder, and is principally made into pipe staves and tun heads. These articles, in addition to some wood for building, and potash, afford a very extensive and profitable export-trade; silk worms are likewise reared, and wax gathered in this province. The duchy of Magdeburg is extremely fertile, and produces grain in abundance. Salt forms one of its most precious commodities. The principality of Minden, and the county of Ravenburg, the latter especially, are fertile in hemp and flax. Rape-seed oil is exported from the principality of Ostfrise, which also furnishes some fat beasts and butter; but the most valuable of its commodities are its horses, a great number of which it exports; sending some to France, and others to Italy. White clay is found here, and manufactured into tiles; some flax is likewise gathered in this principality, of which are made very excellent linen-cloths. Mark contains considerable mines of coal of the best quality: there are besides immense salt-works, which supply the states of the king of Prussia with this necessary article; the surplus is sent to the northern nations. The greatest salt mines are at Unna. Most of the Prussian territories are rich in iron, copper, &c.; and from those contiguous to the Baltic sea, Europe is principally supplied with that singular bituminous substance, called Amber; the revenue from which single article to the state has been estimated at nearly 30,000 dollars.

Manufactures.—Tan-yards are very numerous in Eastern Prussia, but one of the greatest manufactures of this province is ship-building, not only for the Prussian merchant service, but for the use of other nations. Pomerania contains many manufactories of fine cloth, and other woollen-stuffs, part whereof are exported. The linen-cloth of Silesia forms a large branch of its industry, and gives rise to a very lucrative traffic; for these cloths are known, esteemed, and sought for, throughout the continent of Europe: they pass principally into Spain. At Berlin, and Potsdam, there are many silk-loom; the first of these cities boasts the exclusive possession of woollen, and cotton, factories. The manufactures of the rest of the province consist of silken velvets, ribbons, silk, and mixed silk goods of various kinds, dimities, fustians, skins, tapestry, embroidery, delft-ware, &c. Magdeburgh has some silk manufactories, besides some fabrics of cotton, and wool; but the starch and hair-powder made at Halle and Glauchau form its principal branches of industry.

Commerce.—The principal exports of Prussia are grain of every kind, masts,

planks, &c. tar, potash, the skins of stags and elks, leather, hides, yellow amber, wax, honey, manna, linseed and hempseed oil; flax and hempsed; thread, hogs' bristles, deers', elks', and stags' horns, oatmeal, flour, smoked salmon, stock-fish, sturgeon, caviar, lampreys, salted provisions, hogs' puddings, butter, tallow, fat of elks, and pullets. All these species of merchandise are conveyed, during the spring, by rivers and navigable canals, to Königsberg, which is the depôt of Prussian commodities. About 600 vessels annually sail from this port, laden with the aforesaid articles, and in return bring home, as well for the consumption of Prussia, as of the Grand Duchy of Lithuania, wine from France and Halle; besides spices, cloths, silken stuffs, herrings, pewter, iron, copper, lead, tobacco, sugar, syrups, rice, box-raisins, coffee, tea, almonds, indigo, Brazil wood, fruits, &c.

The present extent of the Prussian territory is said to be 5000 square miles, with a population of more than 10,000,000.

Pillaw — is the harbour of Königsberg and Elbing, and is safe and commodious.

Memel — is situated on the river Dange in the Cornish Bay, by which it is united with the Baltic.

Dantzic — one of the first commercial cities in the north of Europe.

By means of these harbours almost all the trade of Prussia is carried on.

Accounts are kept at Dantzic in guldens or florins, each florin consisting of 30 groschen.

RUSSIA. — It is altogether impracticable to give any thing more than the merest outline of the productions and commerce of this immense, and diversified, empire, in a work of this description.

Productions. — The soil of Russia is as various as the extent, and number, of its provinces are great. Those to the southward do not produce the same commodities as those to the northward; and in general this vast country is not cultivated as it ought to be. Livonia and Esthonia furnish corn, hemp, and flax, and Finland, planks, wood for carpenters' use, masts, and tar. The province of Smolensko produces oatmeal, corn, flax, and hemp. Ukraine, from the fecundity of its plains, and the temperature of its atmosphere, may be regarded as the paradise of the empire, as Siberia may, on the contrary, be considered the hell: the former furnishes corn, wax, honey, tobacco, flax, hemp, &c. Its soil is susceptible of every kind of culture. It affords pasture to large herds of cattle, and annually sends forth 10,000 oxen, which pass into Silesia and Saxony; and it is even pretended that some of these are sent to Paris. Although Ukraine produces no wine, the soil is very fit for the culture

of vines, mulberry-trees, and olives. The provinces of Bielsgorod, Simbirs, Penza, and Alaty, are, in conjunction with the preceding province, the granaries of Russia, and in them the culture of corn experiences a daily increase. Tallow, which is an important branch of Russian commerce, is brought from Kalumna and Tula, and other towns in the government of Moscow; but the greatest part comes from Orenburg, a new-built town at the mouth of the river Or, bordering upon a country inhabited by hordes of wandering people, who rear large flocks of sheep, the flesh of which they set no value upon, regarding only the skins, tails, and tallow, as capable of yielding them a profit. Orenburg is surrounded by melting-houses, where the fat of the sheep is boiled down in large cauldrons, and formed into cakes. The Baschirs, one of these tribes, take advantage of the snowy season to transport their commodities to Archangel and to Moscow, whence they pass to Petersburg. The Russian tallow is divided into two sorts; the difference between these being, that one is browner, softer, and dirtier than the other. The prices vary according to their respective qualities. The government of Archangel produces tar, isinglass, wood, and beasts; its kine and oxen are of the Dutch race, and are larger than those of the ordinary species. The calves of Archangel are much esteemed on account of their size, and the delicacy of their flesh. Archangel also furnishes sheep, whose flesh is excellent, but their numbers are less than those brought to Orenburg. Siberia is, without doubt, one of the most useful parts of this empire, on account of its salt, its wood, its skins, and its mines. The province of Nertschinsk is the most fertile part of Siberia, and, if we may give credit to the assertion of a Russian writer, it is inhabited by no less than 25,000 agricultural labourers. Furs and minerals are the richest productions of Siberia. Its principal kinds of fur are beaver, sable, fox-skins, of various colours, those of squirrels, bears, rats, white and brown hares, &c. The best furs are sent to China, and the remainder to Europe, and throughout the empire. Siberia is justly denominated the Peru of Russia, for it possesses mines of silver, copper, and iron. The most considerable mines are those in the territory of Catharinenburg, in the neighbourhood of Buccaria and Argun. In the thirteenth volume of the "Acts of the Imperial Academy of Sciences, at Petersburg," is an excellent memoir on the mines of Siberia, by M. Herman, under the title of "A Description of the Celebrated Silver Mine of Zmeof, in the Mountain Altai, in Siberia." This mine has only been worked since 1745, at the expense of the crown. It yields yearly 1,200,000 pounds of ore, and the whole produce from 1747 to 1793 was

34,441 pouds of silver, among which were also found about 1000 pouds of gold; so that the product may be estimated at 44 millions of roubles, or nearly one million sterling per annum.

The silver mines of Nertschinsk contain some veins of gold, as do the copper mines of Kolyvan. The Siberian copper is of a very good quality, and its iron little inferior to that of Sweden: this last metal is so abundant, and the mines are so numerous, that independently of the quantity which is made use of in the empire, about three or four millions of pouds are annually exported by way of Petersburg. Solkamskoi and Permnia produce the best salt of any parts of Russia: the salters of Archangel and Kola make use of it occasionally, but as it is of a corrosive nature, they in general prefer that of Ivica and St. Ubes.

Manufactures. — Manufactures in general are rather in a torpid state in Russia. Those which consist in the preparation of skins are the most flourishing. There are silk manufactories at Moscow, Jaraslou, and Jamburg. Cloths and other woollen stuffs are manufactured in Russia: but, the cloths, besides being of a very middling quality, are not sufficient for the consumption of the empire itself. The manufacture of coarse linen-cloth and sail-cloth is in a better condition than that of woollens, and great quantities are exported. Cambrics are made at Jamburg; and persians, printed calico, porcelain, and delft, at St. Petersburg. Exclusively of these fabrics, there are also in Russia glass-houses, sugar-houses, salt-works, soap manufactories, tar-works, and founderies for all sorts of metal.

Woollen Manufactures. — There is but little manufacture of fine cloths, and the principal workmen are foreigners. Spanish wool only is employed in the fabric. The manufactories of ordinary cloths are numerous, and they employ the wool of the country, principally that of the Ukraine. Besides these, there are several other woollen manufactories, in which are made the coarsest kinds of cloth for the wear of the peasants and common people. It is in the Ukraine that these last-mentioned manufactures are principally situated.

Manufactures of Linen-cloth, Cordage, &c. — The chief of these are sheetings, white linens, sail-cloth, ropes, twine, and cables. The manufactories of sheetings of the best quality are three in number; two of which are situated at Jaraslou, upon the Volga, and one at Moscow. The two first employ 4000 artificers of both sexes; that at Moscow belongs to the descendants of the Dutch, born and naturalized in Russia. The white linens are much esteemed, and besides those which serve for home consumption, considerable quantities are exported to England, Holland, and some to Spain and Portugal.

It is almost universally known that in Russia sail-cloth and cordage are its principal articles of commerce, and with these it furnishes all the maritime nations of Europe, France excepted. In the empire are also made shirts, trowsers, &c. for the use of seamen, from species of linen called *calamine*, *ravindok*, and *ulams*. The export of these articles is carried on by the Dutch and by the English, the latter of whom send them principally to the West Indies.

Silk Manufactures. — At Moscow and in its neighbourhood are made cut and close velvets, shags, petty-druggets, mohair, damasks for furniture, streaked and close tafetas, handkerchiefs, and stockings, but all these stuffs are of a middling quality. St. Petersburg has manufactories of gauze. A great deal of blond lace is made in Russia, but it is far inferior to that of France. We should not omit to notice the manufacture of tapestry, which is established at St. Petersburg, in imitation of the gobelins at Paris, from which it has borrowed its name. This manufactory produces pieces of silk ornamented with portraits of extraordinary beauty.

Maroquins, Red Skins, or Youfts. — This species of manufacture is one of the most important in the empire, and the best of the kind in Europe. The number of the manufactories is 100; the best and most esteemed are those of Vasil, Serpukow, Below, and Tula; and those of Casan, Schabaksar, and Jaraslou, situated on the Volga. The annual exports of *youfts* amount to 1,000,000 roubles. They are only exported from St. Petersburg and Archangel. The skins of Russia are of six sorts, viz. 1. superfine skins; 2. ordinary fine skins; 3. middling skins; 4. ordinary middling skins; 5. skins of refuse; 6. *Rosswall*. The two last are the worst kinds. The best skins are those of Kostroma and Jaraslou; the next are those of Wologda, Novogorod, Moscow, Pleskoff, and Luga.

Iron-works. — The manufactory at Tula is the only one that Russia boasts in this line; here are made all sorts of iron and copper utensils, which find so ready a sale, that the better articles of English fabric are beginning to lose that reputation which they formerly enjoyed in Russia.

Masts — of a large size are the produce of the forests upon the borders of the Volga, the lesser ones are found near the Volkow. The sale of masts is the exclusive privilege of the crown, and none are exported unless by particular orders from the senate, when they are sent from St. Petersburg and Riga. As to planks, a vast number come from the cutting mills situated along the banks of the Neva as far as Schlusserburg; but principally from those of Carelia, in the neighbourhood of Olonetz. They are all brought by small vessels through lake

Ladoga, and the Neva, to St. Petersburg and Cronstadt. Potash at one time formed a principal article of Russian export, but the trade in this article is at present inconsiderable.

It would seem that the Russian government is anxious to improve the state of manufactures in the empire; for it has published an invitation to all manufacturers of cloth and weavers, in foreign parts, to resort to Russia, on advantageous terms; and gives them leave to settle either in the old cities of Russia, or in the newly acquired provinces. Government offers to pay the expenses of the journey; to furnish them with houses, looms, with their appurtenances, wool, and six months' maintenance. The workmanship of every piece of cloth to be paid prompt. When they have proved their ability, further advantages are proposed for them; and while they work for government, no advances made to them will be expected to be repaid: but if they work for their own account, they must make good those advances. By the ukases of the last three years promulgating the tariff duties, with the lists of articles prohibited from importation and exportation, an additional evidence is obtained of the prodigious interest which the present government of Russia takes in the advancement of manufactures and commerce. Our limits do not admit of any enumeration of these articles, or of any comparative estimate of the trade of Russia previous to, and since, the publication of the new regulations. All we can have room to add to the general statement we have given of the productions and manufactures, will be a classification of its different descriptions of commercial relations.

Russia, we know, is situated partly in Europe, and partly in Asia; and the European part divided into Great, Little, and White Russia. In such an immense country, the manner in which trade is carried on, must be very various: it will be best divided into five parts: 1. The trade with China, through Siberia; 2. The trade with Persia; 3. The trade with Turkey; 4. The inland trade; and 5. The foreign European trade.

1. *Russian trade with China through Siberia.* — Siberia is divided into two governments, Tobolsk and Irkutsk, with the exception of the district of Catharinenburg, which is a government of itself. The peninsula of Kamschatka belongs to the government of Irkutsk. The chief articles of the trade with China are furs, iron, copper, and other minerals.

Tobolsk — the seat of the governor on the river Irtysh, which near this town joins the river Tobol: it has an extensive trade: the merchants bring here leather, coarse grey cloth, linen, and all kinds of European merchandize; taking in return furs, iron, musk, beaver-skins, &c. During winter,

the Calmucs bring cattle, provisions, and sometimes gold and silver. The Bucharians come in caravans in winter with wool, East India silks, and precious stones; also Bucharian cotton stuffs, which the merchants of Tobolsk either buy, or take in exchange for other goods, and afterwards sell at Samarcand. Tobolsk is the depôt for all furs delivered to the Russian government. — *Irkutsk* and *Tomsk* have nearly the same trade as Tobolsk, but not so extensive.

— *Kiachta* consists of two factories; one for the Russian, the other for the Chinese merchants. The Russians exchange chiefly furs for Chinese silks, tea, aniseed, musk, tiger skins, &c. Formerly the trade to China was carried on by caravans sent annually by the Russian government; but it is now an open trade, on payment of certain duties: the amount of this commerce is between three and four millions of roubles annually. In the government of Catharinenburg are thirty-four copper mines, of which thirteen belong to government. The commerce of Kamschatka is not very important, consisting chiefly in the exchange of furs for European articles; the principal of the latter is brandy, which is, however, a monopoly of government.

2. *Russian trade with Persia.* — Besides Siberia, of which we have already spoken, the Asiatic part of Russia consists of great part of Tartary, which is divided into the governments of Astrachan, Orenburg, and Casan.

Astrachan — capital of the government of the same name, is a very populous town, and has a considerable trade; there are above 5000 foreign merchants resident here, of whom many have ships in the Caspian Sea: the principal commerce is with Persia, to which country woollens, furs, iron, steel, lead, linen, and other Russian products are exported; the imports are silk, from Ghilan and Samarcand, cotton from Mazenderan and Ispahan; drugs, tapestry, gold, pearls, and diamonds; which articles also constitute the trade of *Orenburg* and *Casan* (or *Kazan*), capitals of the above-named governments. The extension of this commerce with Persia seems a subject of particular interest with the present government of Russia.

3. *Russian trade with Turkey.* — The Cossacks inhabit one of the richest and most fruitful parts of Russia, comprising the governments of Kiew, Belgorod, Woron, and Asow. The country produces grain, tobacco, honey, and wax, with which a great part of the Russian empire is supplied. The principal places are *Kiew* and *Neschin*, in the government of Kiew. They have a considerable commerce with cattle to Poland and Silesia; a great smuggling trade in furs is also carried on to Königsberg and Dantzic, by way of Poland and Lithuania.

Tscherkask, the capital of the Don Cos-

sacks, may be considered as the centre of the Turkish trade, which has, however, much declined of late. The imports are wines from Greece, olive-oil, rice, &c.; the exports caviar, soap, leather, iron, and other Russian produce. A similar trade is carried on with the Cuban, and Crimean Tartars.

4. *Inland Commerce of Russia.* — Leather is a principal staple article of Russia. The tanned leather (youst) is the finest in Europe: the Russians are so jealous of keeping their pre-eminence in this article, that nothing certain has been ascertained respecting their mode of tanning. One of the chief distinctions of genuine Russian leather is a smell like burnt leather, which cannot be imitated. The best tanneries are at Serpuchow, Below, and Tula. There is but one manufactory of fine cloth in Russia, viz. at Iamberg; but there are considerable manufactories of coarse cloth, chiefly used for clothing the army, and a kind still coarser, for the peasants and poor people. Of hemp and flax are made linens, sail-cloth, cordage, &c. At Moscow, and other places, are silk manufactories; and in Tula so much hardware is made, that it supplies a great part of the empire. The manufactories of sail-cloth and cordage furnish one of the most important branches of commerce; tallow scarcely an inferior one, as it is the produce of distant provinces, whence little else comes. These form the chief articles of the *internal* commerce of Russia; and the two last-mentioned become, after their arrival at her sea-ports, the principal objects of her *external* commerce with Europe. Strangers residing in Russia are not permitted to engage in the inland trade, which is therefore entirely in the hands of the Russian merchants: these may be divided into those resident in some fixed place, who generally confine themselves to certain articles, and into travelling merchants, who go from one place to another, buying and selling; they often make journeys through great part of the empire, which last from five to ten years, and they seldom fail to acquire great fortunes. In the government of Moscow are the following places:—

Moscow, — the ancient capital, and the centre of the inland commerce, has extensive manufactories of silken and woollen stuffs, some tanneries, &c. There is here a great interchange of the several Russian articles of commerce, and extensive purchases are often made for Petersburg, or Archangel account, of tallow, leather, &c. which the merchants from the more remote provinces bring to this market. *Jaroslawn* contains tanneries, silk, woollen, and cloth manufactories, several oil-presses, &c. *Tula*, (noticed before,) besides its manufactories of hardware, has also some tanneries.

The province of Novogorod is fruitful in flax, hemp, timber, wax, pitch, and leather. The three large rivers, Wolga, Dnieper, and Duna, as also the Ilmen lake, render the inland navigation easy; and Peter the Great, by uniting the rivers Twerza and Mista by means of a canal, united the Caspian and Baltic Seas. — *Novogorod*, the capital of the province on the river Volchova; as also *Vischnei*, *Wologok*, or *Wolotschock*, *Pleskow*, and *Twer*, have a good inland trade; *Novogorod* and *Smolensko*, each the capital of a government, are considerable places; *Makeriew* has a great annual fair in July, which is one of the most frequented, and the most important, in the Russian empire. It is in no respect inferior to the most celebrated fairs in Europe, such as those of Francfort and Leipsic, and is frequented by very great numbers of merchants, both Russians and foreigners, who bring goods to the amount of several hundred millions of roubles. In the summer of 1816, a great fire destroyed the buildings appropriated for magazines and shops. The consequence of this misfortune has been a determination to remove the fair to *Niznei-Novogorod*. The Russians, it seems, were much divided in their opinions on this subject, most of them thinking that as *St. Marcarji* was the founder and patron of *Macariew*, the fair could not be removed without offending the saint. Notwithstanding this superstitious idea, the removal of the fair to *Niznei-Novogorod* is determined on. The unoccupied ground there will be rendered proper for the purpose, canals dug, better landing places constructed, and a large stone building erected, containing all the requisite magazines, and measures will also be taken to facilitate the communications both by land and water. All these arrangements have been confirmed by the emperor. The works for the purpose of carrying them into effect are to be completed in 1821.

Inland Fishery. — The river *Ural* is one of the best stored with fish in the whole world, and the Russian government has left the fishery in it entirely to the Cossacks, under the condition of their sending to the army, when they are required, a certain number of regiments, which are equipped and mounted at their expense. The Cossacks are very rich, and they are indebted for their wealth chiefly to the fishery in this river, and the sale of the fish. The river *Ural* flows into the Caspian Sea; when winter approaches, the fish seek refuge in the river from the storms, which at that season visit the Caspian. They ascend the river in such immense numbers, that it is hardly possible to form an idea of it, and stop at different places where they find sufficient water, and food. The Cossacks carefully observe, before-hand, all the places, where such a mass of fish is collected, and

wait there patiently till the river is frozen over. On the 1st of January the fishery begins upon the whole river, from the capital town, Uralski, down into the Caspian Sea. Above, and below, the several banks of fish, the Hetmann first causes the river to be blockaded by means of large double nets extended across its whole breadth, which is effected by cutting in the ice a ditch, if it may be so called, two feet broad. As soon as it is certain that the fish cannot escape, the governor of Orenburg, and the Hetmann of the Cossacks, repair to a certain place on the bank of the river, and on both sides of it above 30,000 Cossacks are ready, each in his own sledge, drawn by a strong and swift-footed horse, and armed with a harpoon and an axe. By the order of the governor, a cannon is fired as a signal for beginning; hereupon the Cossacks all rush upon the river, and drive full speed to the fish-bank enclosed with nets, which is usually some wersts distant. Those who arrive first, are praised not only for the swiftness of their horses, but also for their courage, for this racing is attended with no little danger, because, if any one should be so unskilful or so unlucky as to overturn his sledge, all those that followed would infallibly drive over him. As soon as the Cossacks reach the place where there is such a bank of fish, they immediately cut a hole in the ice with their axe and thrust in their harpoon, and the quantity of fish is so great, that they never fail to strike one every time. The terrible noise caused by the driving of 30,000 sledges over the frozen river, naturally terrifies the fish, which try all to escape at once, but are hindered by the nets. The greatest difficulty for the fishermen, is to draw out the fish, and they are often obliged to call their comrades to assist, for they sometimes spear fish weighing 150 or 200 pounds; but in such cases they must divide the fish with him who assists them. This fishery continues the whole winter, during which the Cossacks dwell in tents on both sides of the river. They proceed successively from one bank of fish to another, down to the mouth of the river. During this time, the river affords a very peculiar spectacle; both its surface, and its two banks, are covered with a countless multitude of men, who are in constant motion. Traders come from the remotest parts of the empire, to buy the fish immediately from the Cossacks, with a great train of sledges, all loaded with salt; they constantly attend the fishery in its progress down the river to the sea. Every evening the Cossacks sell to them what they have caught during the day, and receive payment on the spot. The merchants send the fish (which are frozen quite hard) to Moscow, Casan, &c. and also an incredible quantity of the salted roe of sturgeon, known under the name of caviar.

It is astonishing what a great number of different kinds of fish are found in the Ural, and they all attain an extraordinary size, particularly the sturgeon, salmon, and pike. The very best of these fish cost on the banks of the Ural not more than a half-penny, or three farthings, a pound. The day when the fishery begins, the governor has the fish, which the Cossacks send as a present to the emperor, chosen from among the whole number, and sends them without delay to St. Petersburg, where they arrive quite frozen. The quantity is fixed, and is said to be very considerable. In summer the Cossacks also carry on the fishery, but it is far less productive, and as the fish will not keep in this season, the Cossacks salt them immediately, and send them to the neighbouring towns for sale.

5. *Foreign European Trade of Russia.* —

The exports from Russia to this country are hemp, flax, tallow, iron, tar, pitch, linseed, ashes, and some timber. For hemp, Riga is the best place in the Baltic, and Petersburg the next; that which is exported from the other ports is inferior in quality and proportionably dearer. For-pass-hemp and tow Liebau is a good place. Riga is also the chief port for flax, the sorting being very strictly attended to there; the quality from Pernau is equally good, and the sorting even better, but the quantity exported bears no comparison to that from Riga. Tallow is regularly cheaper at Petersburg than in the other parts of the Baltic; it is also the best port in Russia for iron. For linseed, Riga and Pernau are the best places. Timber is mostly exported from Archangel, Narva, Riga, Pernau, and Wyburg; oak timber from Riga only. Archangel is the best place for tar; it is also generally cheap in the ports of Finland. Ashes are preferred from Petersburg, although Riga ashes are equally good. Rye, oats, and wheat, of inferior quality, are chiefly exported from Liebau, Revel, and Riga, and very good barley from Arensburg, in the island of Oesel. Goods may be exported from any port in Russia; but only the following places may import foreign goods (except salt, which may be imported by every place): in the White Sea, Archangel; in the Baltic, Petersburg, Riga, Revel, and Liebau; in the Black Sea, Odessa, and Theodosia; and in the Sea of Azof, Taganrog. Of colonial produce the chief article is raw sugars, mostly clayed; the duties, which are very high, being the same for all kinds. Crushed lumps are frequently imported as clayed; they are, however, prohibited, as well as all other refined sugars. At Petersburg are the greatest number of sugar refineries, and therefore the greatest consumption of raw sugars: the next important place is Riga, and there is one refinery at Revel. The consumption of coffee in Russia is not

great, as they prefer tea, which they get by land from China; the coffee that goes to Russia must be of a strong bluish colour. The consumption of dye-stuffs is not great, as the Russian manufactories are not yet very considerable: logwood and cochineal are the principal articles at Petersburg: raw cotton, cotton-twist, and white cotton goods, are frequently good articles, if not sent in abundance: St. Petersburg is the best place for them. The importation of spirits is prohibited; but French red, and white, wines are frequently found in Russia. Coals are duty free, and pay well at Riga and Petersburg. For salt, Riga and Liebau are the best places: it should be sent in the middle of summer, or just before winter sets in: formerly, only the salt from Wilitzka was used, which was a monopoly of government; it may now however be imported, it having been found that, notwithstanding the high duty, foreign salt can be laid down much cheaper than that from Wilitzka. Of the ports in the White Sea, the principal is

Archangel, — the capital of the government of the same name, a large populous city, which has a considerable trade: it was formerly the principal port in the Russian dominions, and the English traded here as early as the year 1553; but Peter I. transferred the greatest part of its commerce to Petersburg. The exports are tar, deals, linseed, pitch, hemp, tallow, iron, leather, mats, and flax. The prices of tar and pitch are very uncertain, varying frequently from 200. to 300 per cent. in the course of a year; but both articles are generally cheaper here than in the Baltic ports. The shipping charges, exclusive of duties, are on tar about twelve per cent. and on pitch about thirteen per cent. The deals from Archangel and Onega are considered superior in quality to those from the Baltic, and are often much cheaper; the prices of linseed are generally high, mostly equal to those of good wheat; the charges are about nine per cent. without duty. Hemp is a principal article of export; the quality is much inferior to that from Riga and Petersburg, but prices are proportionably cheaper. Iron, both square and round, is the same as that from Petersburg; sometimes it happens to be cheaper, sometimes dearer. Tallow is generally of inferior quality. Flax and leather are not often exported, as they may be had equally cheap from the Baltic ports. In ordering goods from Archangel, it is usual to remit the amount to a house at Petersburg, which sends the money in specie to Archangel by post. The imports are trifling, chiefly French wines, Brazil and Martinique sugars, coffee, spices, fruits, salt, &c. but not in large quantities.

Accounts are kept in Russia in rubles, each ruble consisting of 100 copecks.

SPAIN is well situated for maritime commerce, but the want of inland navigation renders the communication between the different provinces difficult. For this reason it is, that such as do not grow sufficient grain for their own consumption, are obliged to import it from other countries, chiefly from the Baltic.

Productions. — The productions of Spain are wool, wine, oil, soap, kali, salt, iron, fruits, such as olives, figs, almonds, capers, lemons, oranges, and chesnuts. The olive-oil comes from Majorca, Seville, and Malaga; the soaps and kali, fit for making glass, from Alicant, Carthagena, Valencia, and Murcia; salt from several parts of Spain, particularly the Isle of Yuna, and the Bay of Cadiz; and iron from the mines of Biscay, and Upper Navarre. The wines, game, fruits, and cattle of Spain are excellent. Butter is rare; the chief substitutes for it are oil and hogs' lard. The Spanish wools are the finest, and the horses the most spirited of any in Europe. The rivers and seas abound in fish, insomuch that the fishery of tunny alone has produced a revenue of 100,000 dollars to the Duke of Medina Sidonia. The grain, wines, oils, wool, and silk are, however, the chief sources of Spanish riches. Mines of gold, silver, copper, iron, salt, and quicksilver are to be met with in many parts of this country.

Grain. — Wheat, barley, various sorts of pulse, rye, and Turkey corn are here cultivated; there are no oats grown, and the inhabitants are obliged to import them from foreign countries. All the grain that grows in Spain is good, and extremely fine: in some provinces its growth is extremely rapid; and in Andalusia and Castile, there is so much more grown than they can consume, that about 2500 fanegues of corn (each fanegue being equivalent to about 100 lbs. British) are daily sent to Madrid. Nevertheless, many parts of the interior of Spain are badly supplied, owing to the exorbitant charges of carriage; for even in the trade between Madrid and the provinces, more than 30,000 beasts of burthen are obliged to be in constant employ. The annual consumption of grain in Spain is computed to be about 60,000,000 fanegues. The Biscayans carry corn into Navarre and Arragon; and the Castilians into Galicia, the Asturias, and even France.

Wines. — The wines of Spain are of two sorts, white, and red, which are both excellent. The greatest quantity of wine is produced in the southern parts of the kingdom, and its export to England and Holland is very extensive. Canary wines, though not of Spanish growth, are to be met with in abundance in this kingdom. The wine of Chacoli, in Biscay, is of a very middling quality. That of Guiclas is made with cherries, and is a sort of ratafia. The

wine of Foucaral, a village near Madrid, is red, and of a tolerably good quality. The wine of Val de Penas, Cuidad Real, Rivadavia, Rioxa, and those called La Mancha, are very good, and are by some accounted the best of Spain. The chief wines of Arragon are those denominated garnaches, from the kind of grape which yields them; the best of these is a red wine called *Hospital*, it is truly excellent, and is a capital stomatic. The wine of Caninea, called white garnaches, is very fine, and much esteemed. The wines of Peralta, Fudela, Tafalla, and Arandillo in Navarre, resemble the foregoing, and are very good. To these may be added the wine of Huesea, which is also good. Those of Xeres, (known under the name of sherry) in Andalusia, are dry as well, as sweet, and, we need hardly add, are truly excellent: here are also the dry and sweet wines of Paxarete and Saint Lucar. The strong red wine of Rota (Rota Tent) is an excellent stomatic, and is frequently given to women after child-birth. The wine of Moutilla is dry. In the kingdom of Granada is made the wine called Malaga, or mountain-wine, which is both dry and sweet; also Pedro Ximemes. All these are delicious. That called Malmsey is exquisite, but the Maravella is only an ordinary wine. In the kingdom of Valencia is made Alicante tent, a wine well known in France; when new it is sweet, and becomes thick as its age increases; it is a good stomatic. That of Benicarlo is red and dry, and has been compared to Bourdeaux wine. In Catalonia are made two sorts of excellent wine, viz. *Sichès* and *garnache*. The mountain-tent, and the wine denominated Mataro, are strong rosy wines. The Spanish wines are chiefly exported from the following places: Malaga, Alicante, St. Maria, Porto Real, St. Lucar, and Cadiz.

Brandies — form a considerable object of Spanish commerce. Brandy is made in almost every province of Spain in which wines are produced, but much inferior to that made in France.

Raisins. — Grapes of various sorts are grown in every district of the kingdom, some of which are exported in their natural state, others made into wines, and the remainder dried, and exported. The greatest quantity of raisins is dried in Valencia and Granada. The sorts of raisins exported from Spain are as follow: Muscatel, bloom, sun raisins, and Lexias.

Oils. — Oil being used in Spain as a substitute for butter, is a very valuable article of internal commerce, and is seldom exported, except when the price is very low. The greatest quantity of oil is made in the kingdom of Valencia.

Ashes. — There are three sorts of ashes made in Spain, namely, *barilla*, *bourdina*,

and *aqua-azul*; they are used in the manufacture of soap, glass, and crystal. *Aqua-azul* is a sort of superior *barilla*, and is made in the territory of Alicante only. The others are made in Valencia, Murcia, and Granada. Ashes, particularly *barilla*, form a branch of commercial export, the ports from which they are drawn, are Carthagena, Almeria, Almazaron, Alicante, &c.

Hemp. — The Spanish hemp, particularly that grown in Granada, Murcia, and Valencia, is very good.

Senna — is cultivated throughout Spain in the open fields, and thrives very well; many prefer it to the Levant senna, and besides large quantities consumed in the interior of the kingdom, a great deal is sent to France, England, and Holland. The late King Charles, wishing to encourage the exports of senna, has exempted it from the payment of duties.

Tobacco. — It is the tobacco that is grown near the little town of Trinity, and Saint Esprit, which is prepared at, and known by the name of, the tobacco of Seville; it enjoys a good repute, and is in effect fine and pungent.

Pitch and Tar — are made in various parts of Arragon and Catalonia, and in great abundance in the mountains of Tortosa, where fir-trees abound, and whence a sufficient quantity of these useful articles is drawn for the supply of the kingdom.

Sheep. — There are two sorts of sheep in Spain, the one is sedentary, and passes nearly the whole of its life in the stable, its wool is coarse and wiry; the other, which is continually exposed to the air, yields a very fine wool; this last sort passes at the end of every summer, from the northern mountains of Spain to the plains of Andalusia, La Mancha, and Estremadura, where they spend the winter. From the most exact calculations it has been computed, that there are about 5,000,000 sheep, of the best sort, throughout Spain. The wools of Spain are divided into three classes, viz. 1st, Segovia wool, so named, because it is produced by the sheep which are pastured in the neighbourhood of Segovia and Madrid, in Castile; 2dly, Soria wool, named from the town of the same name in Old Castile; 3dly, Seville or Estremadura wool. The Segovia wool is divided into *piles*, or heaps, formed from the wool of different flocks; the principal of these piles are Paular or Escorial, Infantado and Negreti, formerly called the Jesuits. The Soria wool is also divided into various sorts, the best is that called *Soria Melina*, among which are those of Villa-Real, Badillo, Narros, and Castelfrio. The Seville wool is divided into classes similar to the others. There are also wools of inferior quality, drawn from Spain, particularly by

he French. Every bale of Spanish wool, when exported, is marked with R. F. or S. The first letter signifies superfine, the second fine, and the last inferior quality.

The best Segovia wool is marked thus, ^RHB, signifying superfine of the Hospital of Burgos, and so of the other kinds. The commerce in the article of wool is very considerable; from Bilboa there used to be annually exported from 20 to 22,000 bales, and about one-third part as much from Saint Andero. These two ports are the most extensive in the exports of wool of any in Spain.

Beasts of burden. — The horses of Andalusia are well made and good, but mules are universally used for draught throughout Spain. They are better adapted for mountain travelling, from being surer footed, and requiring less food. They rise to 16 and 17 hands high. Their asses are remarkably large and fine. The exportation of both asses and mules is prohibited.

Skins. — Spain furnishes a great deal of goat-skins, named Cordovans (when dressed), from Cordova, where they are prepared. These skins, as also the moroquins, or prepared kid-skins, are exported to England, Germany, and France.

Silks. — The silks of Spain form one of the most precious productions of its soil, on account of their fineness and good quality. The silks of Valencia are superior to those of Granada, although the latter enjoy a very good repute. The chief Spanish silk-markets are Valencia, Murcia, and Granada.

Cork. — The Spanish cork-wood is much esteemed, and large quantities of it are exported.

Mines. — There are mines of almost every description in Spain. The principal silver-mine is that of Gualdalcanal, situated in Estremadura, twelve leagues from Seville. A Spanish author, *Alphonso Caranga*, tells us that silver, to the value of 60,000 ducats, is weekly drawn from this mine. *Bowles* says, that there are green and blue copper-mines in Estremadura, Sierra Morena, in the mountains of Sequia, in those between St. Andero and Reynosa, and at Molina. "The surfaces of all those mines," he adds, "wear the appearance of green and blue carpets, and the mines themselves contain precious stones." In every province of the kingdom iron is to be found. The iron-mines of Biscay are the principal; there is also a good mine at Somorrastio, where every one is at liberty to dig the ore and dispose of it as he pleases. The mines of Biscay supply the cannon-foundries, and the anchor-forges, of Liernanet and Cerada; balls are manufactured from this ore at Faqui, Azura, and Hier-Biera, and musket and pistol barrels are made from it at Pla-

centia and Valencia. There is a mine of cobalt in the valley of Gistan, in Arragon. At a short distance from Santa-Cruz de Mudela, at the foot of Mount Sierra, there is a mine of antimony, nearly level with the surface of the earth. At Alcañiz, in Arragon, is a mine of alum-stone, which is better than that of Rome. In Spain, one-third of the uncultivated lands and public roads contain saltpetre in its raw state. There are also many salt-pits, not only in the interior of the kingdom, but likewise along the coasts, particularly those of Andalusia, Valencia, and Catalonia, and in the islands of Majorca, Ivica, and Fromentara. Salt forms one of the export articles of Spain.

Manufactures, as well as agriculture, have been in a flourishing state in Spain. We shall now proceed to detail them under their various heads.

Woollen Manufactures are not sufficiently considerable to employ the wool of the whole country, although those of Guadalupe, Enguera, Onteniente, and Concen-teyna, in the kingdom of Valencia, are very important. The cloths made in Spain are of a good quality; but although the wool is fine, it seldom is sufficiently cleansed prior to its being manufactured. In some provinces, besides ordinary cloths, are made baizes, serges, druggets, &c. Guadalaxara is the only part of Spain in which the famous cloth of Vigonia is made.

Silken Manufactures have been so much encouraged in this kingdom, that it is said there are above a million persons employed in feeding and managing silk-worms, as well as in manufacturing all sorts of silks, such as satins, damasks, tabbies, velvets, and various other stuffs. The principal manufactories of silk are those of Seville, Granada, Segovia, Toledo, Cordova, Murcia, Valencia, Saragossa, Valladolid, Medinodel-Campo, and Burgos.

Linen and Mustin. — There are manufactures of the latter article at the port of Santa Maria, the isle of Leon, and at Xeres. At the same places, painted linens, which have for several years past made a rapid progress, are manufactured. These articles were principally sent to Spanish America, and in 1792 there were exported from Cadiz for the above place, muslins and linens to the value of 100,000,000 reals of plate.

Cordage. — There is a sort of cordage made in Spain, called *sparta*, which possesses the peculiar qualities of floating on and resisting the water, and of sustaining no injury, or diminution, even by a continued friction against stone or other hard substances.

Paper is made, in small quantities, in some parts of Spain: it is not so white as the French, or Dutch, paper, but is, on the whole, tolerably well manufactured.

Hats of a very good quality are made in Spain, many of which used to be sent to South America. The duties upon the importation of foreign hats are excessively heavy.

In fine, Spain boasts many other manufactures, such as wax, bleaching, tan-yards, &c. all of which might, under a more favourable state of encouragement, and under the auspices of a more liberal internal policy, be augmented to an almost unlimited extent.

Commerce.—The commerce with Spain is divided into two parts, namely, that of its natural productions, which pass through all the ports of the kingdom, and that of the productions of America, which is engrossed by the port of Cadiz. In the present state of the struggle between Spain and her South American dominions, it is difficult to say what territory she continues to possess, and what trade she carries on. As it stood previous to the late revolution in the colonies, the course of trade was as follows: Different sorts of vessels, galleons, registered ships, &c. carried annually to Porto Bello the merchandise destined for Peru. Beside these, a fleet destined for Mexico traded to Vera Cruz. Having first disembarked their cargoes, they took in silver, precious stones, cochineal, indigo, cocoa, tobacco, sugar, and skins. They departed from Vera Cruz sometimes in the month of May, but most frequently in August, and proceeded to the Havannah in the Isle of Cuba, where they met with the galleons on their arrival at the Havannah; they dispatched light vessels to Spain with an account of their cargoes: thence they proceeded to the gulf of Florida, and passing the Bahama Islands, pursued a north-easterly course to St. Augustine, and so on to Spain. A registered vessel is that which has permission to carry merchandise to America, and to bring thence cochineal and silver. Spain carries on a considerable traffic with its West India settlements; for particulars, we refer the readers to the article AMERICA, under the head WEST INDIES. Spain draws from Vera Cruz, gold, silver, cochineal, vanilla, skins, and jalap; from Santa Fè, the same articles; from Guatimala, gold, silver, cochineal, indigo, skins, sarsaparilla, jalap, cotton, wood, balm, &c.; from Maracaybo, tobacco, cocoa, indigo, raw hides, &c.; from Campeachy, logwood, skins, honey, wax, sugar, cassia, &c.; from Gayra, upon the coast of Caraccas, the best cocoa of America; from Havannah, sugar, tobacco, hides in the hair, tallow, ginger, aloes, &c.; from Porto Rico, sugar, ginger, skins, cotton-wool, oranges and other fruits; from Carthagena, silver, tobacco, cotton, cocoa, indigo, skins, &c.

Spain carries on a considerable trade with North America, whither it sends wines, particularly sherry; brandy, fruit, such as

oranges, lemons, &c. and some gold and silver, besides precious stones, &c. From North America, she draws immense cargoes of corn, besides considerable quantities of wood, salted flesh and fish, tallow, spruce, and other commodities of trifling value. From her two islands in the West Indies, Spain imports sugar, coffee, small quantities of rum, ginger, pimento, and other spices; and in return supplies them with every species of European commodity of which they may stand in need.

The English carry on a greater traffic in the ports of Spain than the Spaniards do in those of England. The English vessels chiefly frequent the ports of Cadiz, Malaga, and Alicante, where, besides gold in ingots and bars of silver, they carry away wines, fruit, brandy, wool, ashes, and many of the commodities of Spanish America. English woollen-cloths, previously to the late disturbances in Spain, were prohibited from entering into the Spanish ports; nevertheless, the English found means to bring into Spain vast quantities of cloths, baizes, serges, perpetuanes, &c. cotton stuffs and various other manufactured articles; likewise herrings and dried fish of different kinds.

The traffic of Spain to Holland consists of wools, shipped at Bilbao and other ports of the Bay of Biscay; at Cadiz, fruit, wine, oil, kali, soap, shumac, Biscayan lead, fossil salt, alum, flax, Canary wine, brandy, silk handkerchiefs, aniseed, vermilion, and pilchards. The Dutch sell the greater part of their spices and ambergris to the Spaniards, as also wax, which the former obtain from the Baltic. It is from the considerable traffic which the Dutch carry on with Spain, and those parts of America dependent upon this country, that they supply themselves with gold and silver, which they afterwards convert into articles of commerce, and send to different nations. The Dutch likewise derive another advantage, from their intercourse with Spain, namely, the capability of furnishing Russia, Sweden, Denmark, and Germany, with the commodities of the latter kingdom.

There is but a small number of vessels belonging to the ports of the Bay of Biscay, engaged in the commerce with Hamburgh, Dantzic, and the other towns seated on the Baltic. The Spaniards usually carry thither, however, Malaga, Tozo, and Rivadaria wine, brandy, vinegar, oil, olives, grapes, figs, raisins, lemons, oranges, wools, silken stuffs of Andalusia, raw silk, chocolate, tobacco, dyes and drugs. The returns are masts, tar, pitch, tallow, hides, &c. &c.

The Spaniards possess in Asia the Philippine or Manilla Islands, and the Marianas or Ladrões; and in Africa, Ceuta, Oran, and Annabon, and Fernando-del-Po Islands; hither Spain sends iron, fruits, glass beads, steel, fire-arms, some brandy, oil and other

commodities; and in return receives camwood, ivory, and gold dust. Accounts are kept in Spain in reals, each real consisting of 34 maravedis.

SCOTLAND.—The soil of Scotland consists of every variety in nature; but its general character, in point of fertility, is much inferior to England, and Ireland. The highlands of Scotland have been compared with the moorlands of Yorkshire; and, of late, the principal nobility and gentry have formed themselves into a society, called *The Highland Society of Scotland*, giving premiums and various encouragements for the improvements of waste lands, and the amelioration of the breeds of black cattle and sheep. The soil produces wheat, rye, barley, oats, pease and beans, flax, hemp, hay, potatoes, &c. and almost every sort of crop in common with England, although not in such perfection, and at times precarious with the season. Scotland is certainly more fertile in oats, rye, and pastures, than in wheat, but still considerable quantities of the latter species of grain are grown in some counties, especially in Stirling, Dumbarton, and in the southern district of Ayrshire. The Scotch flax and hemp are, generally speaking, coarser than the Irish: abundance of these useful articles are annually gathered in Scotland; and the cultivation of them has been encouraged by divers bounties since the year 1765. Hops are grown in the southern shires, and their quality is tolerably good. The madder-root has been cultivated with success in Scotland, as has liquorice, but neither of these in very great abundance. Apples and other fruits are also produced in large quantities. Juniper shrubs grow naturally on the hills; and the *whortle* or *blae berries*, (*vaccinium myrtillus*), grow on the high mountains, in the greatest abundance.

Beasts.—The domestic animals are similar to those of England; but the native breeds of black cattle and sheep are considerably smaller, yet very excellent as articles of food. The Scotch oxen and runts are in general bought up by English graziers, and after being fattened in good pastures in England, are sent up to the London market. Immense herds of cattle are annually driven out of Scotland for this purpose. It is computed, that upwards of 120,000 sheep are each year sent into England, in which kingdom the greater part of the fleeces shorn in Galloway, Ayrshire, Nithsdale, and Tiviotdale are sold. The Scotch wool is improving very fast, and with a little attention on the part of the farmer and the Highland Society, will very soon equal the Spanish; the Shetland wool is as fine as any that can be procured from that country. Scotland feeds vast herds of goats; the skins of which give employment to many of the industrious inhabitants engaged in the

making of women's gloves. Among the domestic animals peculiar to Scotland, may be classed those dwarfish horses, called *ponies*, *galloways*, or *shelties*, which are chiefly used for conveying articles of small bulk in panniers, from one part of the country to another. These little beasts are extremely sure-footed, and therefore well calculated for travelling in the mountains or highlands.

Birds.—Of the feathered tribe, the Scotch boast the exclusive possession of that beautiful bird, called *capercailzie*, or cock of the wood: but it is now extremely rare. The ptarmigan, the black game and grouse, are abundant in the heathy mountains; and the low grounds produce partridges, snipes, plovers, and various other birds.

Fish.—The cod and herring fishery is carried on all along the sea-coast of the Long Island, from the Butt of the Lewis to the Barra Head, but most successfully towards the extremes of that range; also, around the Isle of Sky, the islands of Canna, Muck, Tyre, Coll, Mull, and, in general, all along the coast of the main land, from the point of Ardnamurchan to Cape Wrath. The boats employed are generally commissioned from Peterhead. The price of these boats with sails, masts, oars, &c. is generally from 15*l.* to 16*l.* each; and a proper set of hooks and lines for each boat will cost from 12*l.* to 14*l.* The fishermen meet in the month of February, to arrange the business of the season; they then commence the fishing, which generally lasts until the month of July; at that time the quality of the fish becoming worse, and the shoals leaving the banks for other parts of the sea, the fishermen conclude for the season. It is no uncommon thing for a successful boat to have caught in this time from 16 to 18 cwt. of fish. These are sometimes sold to merchants in the country, who keep salt stores and other necessities for fishermen. But, in many instances, and, in particular, the inhabitants of Barra and Uist carry the fish in their own boats to the Greenock or Glasgow markets. With respect to the herring-fishery on the coast of Caithness, during the season upwards of 80,000 barrels of herrings have been taken and cured! The Highland Society encourage the fisheries of Scotland. The Scotch fishers catch in abundance every species of fish known in the English markets, whither they even carry vast quantities of the best kinds.

Mines.—Scotland cannot boast of mines of the most precious metals. No mines are now wrought solely for silver, but the lead-mines are exceedingly rich in that metal. Iron ore is abundant; copper has also been discovered in many places, and there is a rich mine of antimony in Dumfriesshire; the other metallic substances are cobalt, manganese, &c. In the southern and midland districts coal is abundant. Lime-

stone, freestone, and slates, are found in every district; and many of the marbles prove equal, in colour and polish, to those of Italy. Pearls are found in the great horse-muscle, a native of the northern rivers; the sapphire is found, in several places, of different shades, from a deep red to a transparent white, and of equal hardness with the oriental. The topaz is found in the highland mountains; and the ruby and hyacinth mixed with the sand on the sea-shore. At Portsoy is found that singular kind of granite, called *Moses's tables*, which, when polished, the marks on it resemble Hebrew characters, on a white ground; besides these, there are many curious and rare fossils. Among the districts of metallic ores, there are many springs of mineral impregnation; the chalybeate waters are very numerous: at Moffat, near Edinburgh, are sulphureous springs.

Manufactures.—The manufactures of Scotland are at once various, considerable, and important. They consist chiefly of linen, thread, lace, muslin, variety of cotton articles; caps, stockings, &c. of wool; besides sugar, pottery, paper, and cannon.

In 1746, an association, composed of the principal nobility and gentry of Scotland, at the head of which was the Duke of Argyle, was formed, for the purpose of encouraging the linen manufactures; its efforts were crowned with every success that could be wished for. Some French Protestants, who had fled from persecution in their own country, took refuge in Scotland: to these refugees is to be attributed the improvement in the mode of bleaching, and the perfection to which that art has been brought in North Britain. The Scotch laces are principally composed of thread, very few silk laces being made in this country; they are considered to be equal to the Buckinghamshire articles. The manufacture of long lawns has been established since the year 1765, and succeeds extremely well: Scotch cambrics and muslins are also in high repute, and sell well both in the English and foreign markets. *See title COTTON.* Paper of the very finest description is made in many parts, which, as well as the coarser sorts, finds a good market at Edinburgh and London. The Scotch plaids, or cross-barred and particoloured stuffs, known by that appellation, are made of silk; but more frequently of worsted. That made of silk is generally used in the formation of ladies' garments, such as pelisses, gowns, shawls, ribbons, &c. The worsted stuff is chiefly consumed by the lower orders of people in Scotland, who make it into petticoats, cloaks, stockings, &c. There are not many manufactures of fine woollens in this country, but of the coarser kinds of woollen goods there are several. The preparation of kelp has, of late years, become important among the manufactures in Scotland. The principal

situation for kelp is in Long Island. The manufacture was introduced by certain Irish adventurers, about 60 years ago. Before that time, the manufacture of the article was wholly unknown on the north-west coast of Scotland. Some inhabitants, profiting by the example of the Irish, commenced the kelp business themselves; and, having gained considerably by the undertaking, the system became general. The manufacture has gradually extended from that period, down to the present time; and, on some estates in the highlands, affords now no inconsiderable share of the revenue arising to the proprietor. A great part of the kelp is made from cast or drift ware, which comes ashore, on the west coast, after a gale of westerly wind. This ware, if not instantly secured, is often drifted back again to the sea; and although it may afterwards return to the shore, it is in general found, in a few days, to have lost so much substance, as to be utterly unfit for its original purpose. It requires 350 horse-loads of ware of this description to make a ton of kelp; and, it may easily be conceived, that without a number of hands, always ready on the watch to secure the floating ware, no great quantity of kelp could be made. The rest of the kelp in these islands, is made on the east coast, from the growing ware found in the bays and arms of the sea, and often on sunken rocks, at some distance from the shore. Great part of this is cut, and floated ashore on rafts, or in boats, and is attended to the maker with no inconsiderable degree of toil and risk. To expedite the business, and for mutual convenience, the kelpers generally form themselves into small parties, make a joint stock of their ware, and divide the manufacturing price at the end of the year. This manufacture is, at all times, and particularly in a rainy season, a difficult and precarious business: and generally can only be carried on in the months of June and July, and the two first weeks in August.

Commerce.—The number of sea-ports in Scotland, combined with the industry, activity, and commercial abilities of the inhabitants, render the external trade of this country most flourishing. And in no part of the United Kingdom has greater improvement in *internal* commerce taken place than here, from the number of canals that have been made of late years; and which, brought into one point of view, are as follow:

1st. The Forth and Clyde canal uniting these two rivers, being cut from near Grangemouth in the former river, and within 10 miles of Glasgow in the latter.

2d. The Caledonian canal, running in a direction nearly east and west, from near Inverness on the east coast, through a number of lakes by Forts Augustus and William, to the west coast, making a complete section of Scotland, completed in October, 1822.

3d. A canal uniting the rivers Tweed and Solway.

4th. The Union canal, recently commenced, to communicate between Edinburgh and Glasgow, independently of the rivers in their neighbourhood.

Scotland exports salted provisions, such as beef and pork; oxen, kine, butter, cheese, wool, smoked and salted fish, fish-oil, iron, lead, timber, woollens, silken and woollen plaids, linens, laces, muslins, lawns, cambrics, kelp, glass, and other articles of less considerable importance. She has this considerable advantage, in a commercial point of view, namely, that she exports more merchandise than she imports; and, consequently, that the balance of trade being continually in her favour, her wealth experiences uninterrupted augmentation. The balance of commerce, between England and Scotland, is invariably in favour of the latter; and the merchandise which the former sends hither, bears no sort of proportion to what she imports thence. Scotland draws little from England besides woollen cloths, and some silken goods; whereas she supplies the mother country with immense quantities of butter, cotton-goods (afterwards printed in England). The same may be said with regard to the trade with Ireland: the balance is always in favour of Scotland, and until within these few years, the latter not only supplied the former with abundance of coals (which branch of trade is still maintained), but with many cargoes of West India produce. To enumerate the different branches of external commerce in which Scotland is engaged, would be merely to repeat what, with little exception, we have already said respecting the commerce of England; we shall, therefore, conclude our general observations, and proceed to notice the principal trading places of this kingdom, as the best mode of conveying a precise notion of the extent and importance of Scotch commerce and manufactures.

The port of *Aberbrothick* (commonly called *Arbroath*) is of great antiquity, and has a good trade for coals and lime. The manufactures here are chiefly brown linens and osnaburghs. It exports thread, barley, and wheat, to England; and imports flax, flax-seed, timber, &c. from the Baltic.

Aberdeen, — consisting of two towns, the old and the new, is, so far at least as concerns the latter, a place of flourishing commerce, and rising manufacture in calicoes, linens, and threads. It is reckoned the third town in Scotland; its harbour at the mouth of the Dee is defended by a strong stone pier twelve hundred feet in length, consisting of the finest granite, and erected at an expense of at least 20,000*l*. The tonnage of shipping built at, and belonging to the port, is considerable, its fisheries profitable, its manufactures in the articles before

mentioned thriving, and with its traffic of exports to Germany and the Baltic, furnish subsistence, and even opulence, to a population (on the two towns together) of near 50,000 persons.

Annan — exports, yearly, from 20 to 30,000 bushels of corn, and has a good coasting trade.

The town of *Ayr* had formerly a considerable trade, but the rise of Glasgow has diminished it; though of late years it has, to a certain degree, revived. It is situated at the confluence of the Doon and Ayr, and has two reflecting light-houses to conduct vessels safely into the harbour. The river Ayr is subject to the inconvenience of a bar of sand, particularly when the wind blows strongly from the north-west. The two rivers have great plenty of salmon. Companies are established here for curing white fish; though the principal trade is in the exportation of coal to Ireland, in which about 2000 tonnage of vessels are employed.

Dumbarton — suffered most materially during the wars in the 17th century, which nearly annihilated the trade, to which its extensive salmon fishery gave rise. This branch of industry and commerce has, however, of late years experienced a complete renovation, and the town sends immense quantities of cured salmon to most parts of Europe, besides a vast deal of the fresh fish to the populous cities and towns of England and Scotland. Some tar is made in the vicinity of this town, which abounds in fir-trees of the finest species. The chief manufacture is that of glass, and there are several bleach-fields on the banks of Leven water.

Dumfries — has imported 30,000 tons of tobacco per annum, from America; and, in time of peace, carries on a good trade with France; principally a contraband trade.

Dunbar — has a safe harbour, and is defended by a strong battery. Here are a large and convenient dry-dock, and two considerable rope-walks. The herring-fishery is carried on so extensively at this place, as not only to supply the demand of the vicinity, but to admit of a considerable annual export of the article. The mode of curing the herrings, as practised here, is similar to that pursued by the Yarmouth fishers: the Dunbar herrings are larger than those of the latter place. There is a vast export of corn hence, and about six vessels are each year sent to the whale-fishery.

At *Dundee* — the river Tay is $2\frac{1}{2}$ miles broad, and affords a safe road to vessels of large burthen, and there are upwards of 120 vessels, in different trades, belonging to the ports. On the quay are several new ranges of warehouses. Dundee exports large quantities of grain to London, and the same commodity to Amsterdam; three or four vessels likewise depart hence, every year, for the whale-fishery. The principal ma-

nuufacture here is that of linen, particularly of osnaburghs, canvas, bagging, &c. for exportation; and the Dundee coloured thread has long been in high repute. This place supplies most of the adjacent country with English commodities, principally brought from London by the smacks. The inhabitants are in number, 50,575. They have a good salmon-fishery.

Dysart — has about 700 looms employed in the manufacture of checks only. A number of hands are also occupied in ship-building here. It has a very good harbour, and about 35 vessels employed in the coal and foreign trade. Vast quantities of salt are made in the neighbourhood; and the inhabitants of the surrounding villages are mostly engaged in the manufacture of nails, and other species of coarse iron-work. The coal and iron mines in the vicinity, are abundantly productive.

Edinburgh. — The chief manufactures of Edinburgh are cambrics and stockings; and there are, likewise, various other arts exercised in the city and its vicinity, connected with the supply of the various demands of the inhabitants of this large, populous, and wealthy place. Its population is now reckoned at 138,235; but its trade being mostly carried on at its suburban seaport, Leith, we must refer the reader to that article.

Glasgow. — with respect to trade, commerce, and manufactures, may be considered the chief city of Scotland. Pit-coal, and other articles required for the establishment of manufactories, are found in abundance in the whole of the surrounding districts, on both sides of the Clyde. Some of the pits are worked near the city, and even in the suburbs, especially at Camlachie. The annual value of the produce of the coal-mines is estimated at from 50 to 40,000*l.* sterling. Over the coals there is a thin, but very rich, stratum of iron-stone. This was formerly considered as an incumbrance, but since the erection of the Clyde iron-works, it has been employed in the most advantageous manner, and affords a new source of em-

ployment to a great number of persons. In early times, the trade of Glasgow chiefly arose from the curing of salmon and herrings, which were for the most part sent to France, whence wines and other commodities were received in return. In 1609, the population of Glasgow amounted to only from 7 to 8000; 50 years after that period it was from 14 to 15,000; in 1755, it had increased to 27,415; and in 1775, to 43,000. From the census in 1821, it appears to have increased to 147,043, without including the suburbs and adjoining places. The Clyde was formerly so shallow, that only vessels of 30 tons burthen could come up to the quays; but since 1771, the bed of the river has been deepened sufficiently for lighters of from 70 to 90 tons burthen. The superintendence of the navigation of the river is entrusted to a Board called the Commissioners of the River Clyde. Port Dundas is a bason at the end of the collateral cut of the great canal, distant 23 miles. The Monkland canal goes from Glasgow about 10 miles to Airdrie, and serves chiefly for the conveyance of coals from the neighbourhood of that village. The merchants and tradesmen assemble at the Tontine Coffee-house, for the purpose of transacting business. In the Tontine buildings goods are sold by public auction; and there is a large room where the merchants show samples of sugar, &c. each having his own stand, with drawers. A book is kept of all the transactions, and bargains are concluded on the spot. There are nearly twenty banking-houses in Glasgow; and as many offices of insurance. Most, if not all, the insurance companies of London have establishments here, beside which, there are others kept by natives as well as foreigners.

The police of the city of Glasgow is governed by a lord provost, three baillies, dean of guild, and deacon convenor *ex officio*, and twenty-four commissioners, chosen by inhabitants possessing houses of 10*l.* yearly rent and upwards. The funds for defraying the expense to be raised in the following manner:

<i>On the yearly rent of subjects rented or valued</i>		<i>An annual Assessment not exceeding</i>	
At 4 <i>l.</i> and under 6 <i>l.</i> sterling yearly	-	-	3½ <i>d.</i> per pound sterling.
At 6 <i>l.</i> and under 10 <i>l.</i> do.	-	-	5 <i>d.</i> do.
At 10 <i>l.</i> and under 15 <i>l.</i> do.	-	-	7 <i>d.</i> do.
And at 15 <i>l.</i> sterling yearly or upwards	-	-	10 <i>d.</i> do.

The city is divided into twenty-four wards, or districts; under the inspection of twenty-four commissioners, chosen upon the first Monday of September, annually. The streets are designated by name, the houses numbered, and the whole city watched, and in all respects regulated much after the manner of London.

The principal articles of exportation from Glasgow, and the ports farther down the river, to America, and the West Indies, are British manufactures, coals, fish, &c. To

the continent of Europe, and the ports in the Baltic, besides British manufactures, raw and refined sugar, coffee, cotton, rum, and other productions of the western hemisphere, Glasgow imports from the West Indies and America, the principal articles of growth or manufacture there, such as coffee, cotton, sugars, rum, wheat, flour, mahogany, staves, pot and pearl ashes, fruits, &c.; and from Spain and Portugal, wines and other productions of these countries; from the Baltic, wood, iron, flax, hemp, pitch, tar, Russia

linens, and wheat. To Ireland, Glasgow sends manufactures, and in return receives hides, grain, salted beef, butter, meal, linen cloth, &c.

The combined powers of foreign trade, coasting trade, and manufacture, the two last of which have made, and still continue to make, such prodigious strides, now operating on each other with redoubled energy, are plainly discernible in the rapid increase of its population (now next to that of the metropolis) and of new buildings, and bid fair to secure to its industrious and enterprising inhabitants, a growing and permanent fund of wealth and prosperity.

As the Union gave new life and energy to the commerce of Glasgow, so it appears to have been one of the chief causes of the rise and prosperity of the manufactures. But long before the Union, the manufacture of plaids was carried on here; likewise a soap work, and one for making ropes. It was between the period of 1725 and 1750, that the spirit of manufactures first became prevalent, and as it has been ever since increasing in energy, and diffusing its influence, its effects for several years past have been wonderful. The variety of manufactures now carried on in every branch is very great, but that which seems of late years to have excited the most general attention, is that of cotton cloths of various kinds, together with the arts depending on it. In order properly to conduct this manufacture in all its branches, cotton-mills, bleach-fields, and print-fields, have been erected on all the streams in the neighbourhood, and even in situations more remote; neither is this trade altogether confined to the workmen in the city, several thousand weavers being employed by the manufacturers in Glasgow, who live in the country, even to a distance of 50 or 40 miles. By a computation which was made in the year 1791, it was said there were upwards of 15,000 looms employed in this branch; that each loom gave employment to nine persons at an average, in the various stages of the manufacture, including women and children, in all 155,000 persons; and that each loom, at an average, produced goods to the value of 100*l.* per annum, making in the whole the sum of 1,500,000*l.* sterling; since then, the increase has been prodigious. This manufacture is not only important of itself, but is productive of work to many thousands of bleachers, tanners, calico-printers, &c. &c. many of whom being women and children, whose work was formerly unproductive, renders it of still more general importance. All kinds of pottery, together with bricks, tiles, &c. &c. are made here in abundance. Hats for exportation; also men's thread, and cotton, stockings, and gloves of all kinds. Snuff, shoes, saddles, ropes and cordage of all dimensions, soap and candles, and refined sugar, bottles of green glass, and flint glass manu-

factures, have arrived to great perfection. The cutting of glass is executed with taste. About the year 1792, a very extensive brewery was erected, and since that time there have been several others, even to such an extent that their produce has been estimated at little less than 100,000*l.* per annum. The first bleach-field in the neighbourhood was under the patronage of the trustees for manufactures, &c. begun about 1790. Oil of vitriol, an article requisite in the process of bleaching, is manufactured here in a considerable quantity; before 1750, what was used was brought from England and Holland. The cudbear manufacture is also carried on here: it was begun in 1777: this is a manufacture for making a dye-stuff, employed chiefly in the woollen, and silk, manufactures of Britain, and is made from an excrescence that grows upon rocks and stones, a species of the *lichen* or rock moss, which, with certain chemical preparations, makes a dye-stuff called Cudbear. The dyeing of Turkey red on cotton was established here earlier than in any other part of Great Britain, viz. 1785. One Papillon, a Turkey red dyer from Rouen, was brought to Glasgow, and an extensive dye-house was built at Dalmarnock, in the neighbourhood, where cotton is dyed a real Turkey red, superior in beauty and solidity to the East Indian colours. Since then, from the publication of the process, several others have been erected for the same purpose, at which several hundred men are employed in dyeing that colour alone. By means of these establishments the manufacturers are enabled to make cotton pullicate handkerchiefs, not inferior to any in the known world. Another manufacture, a substitute for sugar of lead, called the red liquor or pyroligneous acid, in the dyeing and printing business, is carried on here. The art of type-founding has long been carried on here with deserved reputation, and can boast of being equal to any in Britain, perhaps in Europe; the exactness of the types, and the durability of the materials, give them a decided preference.

Greenock. — The harbour of Greenock is very commodious, and has lately been improved at a great expense; a kind of basin is formed between two semi-circular quays, which contain sufficient depth of water for vessels of the largest burden. At the beginning of the last century, Greenock was merely a collection of fishermen's huts, without trade or harbour, and in the middle of the same century had scarcely 4000 inhabitants. From the time of the Union till the American war, the trade of Greenock depended almost entirely on that of Glasgow, merchants of the latter being the principal owners of the shipping: but now the chief portion of the shipping belongs to merchants settled here, who carry on the greatest part of the trade on their

own account. Before the revolt of the colonies, all the ships belonging to the Clyde were built in America; but since 1783, ship-building has been carried on with the greatest activity at Greenock. In 1791, a ship of 1100 tons, called the *Caledonia*, was launched. The manufacture of sail-cloth, cordage, and other articles required for the rigging of ships, as well as the making of nets and other tackling for the fisheries, employ a great number of the inhabitants. The refining of sugar is at present the principal manufacture. Greenock carries on a very considerable trade with America and the West Indies, whither the merchants export the muslins and other manufactures of the adjacent districts; and import in return, rum, sugar, cotton, coffee, rice, grain, pot-ash, timber, &c. From other countries they bring wine, fruits, oil, naval stores, and a variety of other articles. The vicinity of the great canal presents superior facilities for forwarding West India commodities to the north of Europe.

Haddington — is seated on the river Tyne, by means of which it carries on a tolerably good trade. Here is a manufactory of coarse woollen cloth, beside manufactures of shalloons, baizes, long ells, Worcester plushes, and carpets. Prior to the Union there was a company established at New Mills, in the vicinity of the town, for the purpose of carrying on these manufactures; but on the two kingdoms being united, this association was dissolved. There is a weekly market in this town for the sale of woollen cloth, which is sold in the state in which it comes from the loom, being fulled and prepared for use by the buyers, who mostly reside in the neighbourhood.

Inverkeithing — has a large and safe harbour and bay, which afford excellent shelter for ships in all weather; hither his Majesty's ships of war sometimes come from Leith roads, and ride at anchor to avoid the winter storms; and merchant ships from the Mediterranean formerly used to perform quarantine here. The harbour itself is a small bay, at the mouth of which, on the west side, lies a floating lazaretto, where, instead of detaining ships from foreign ports, the particular goods in which any infection may be supposed to lodge, are immediately received, aired under the direction of a proper officer, and delivered within a limited time to the owners. There are sometimes between 40 and 50 vessels from different places, waiting here for coals, especially in the winter season. Several ships belong to this port, but none of any considerable burthen; some of them sail to foreign ports, and the others are employed in the coal, and coasting trade. Not far from the town, a lead-mine was discovered, which belonged to the Earl of Morton, but after being wrought some time the lead disappeared. A

herring-fishery has lately been begun on the coast: here are several salt-pans, and an iron-foundry.

The chief manufactures of *Inverness* are of hemp and flax, and some of cotton and woollen; there are also several tanneries, brick-works, &c. The harbour of Inverness is safe and commodious; vessels of 200 tons can unload at the quays, and those of 500 tons can ride with safety in the Frith, within one mile of the town: the ships belonging to the port are chiefly employed in carrying salmon and the manufactures of the country to London, and in bringing back various articles of grocery, &c. The salmon-fishery in the river Ness is very considerable, and is formed by several of the leading fishmongers of London: here is also a good herring-fishery, the management of which is vested in a company; it is carried on between Inverness, and Fort William. The town has some inland trade with the Highlands.

The principal trade of *Irvine* is in the exportation of coal for Ireland: in 1790, there were 51 vessels belonging to this port, the tonnage of which amounted to 3682 tons, the largest 160 tons, and the smallest 33; and about 24,000 chaldrons of coals are exported annually. Considerable quantities of woollen goods, carpeting, muslins, gauzes, lawns, and linen are likewise exported hence. The principal imports are hemp, iron, and deals, from Memel and Norway; ship-timber and corn. There is a dock-yard for ship-building, a large tannery, and a bleach-field.

Kelso — has large manufactures of woollen cloth, and many hands are here employed in dressing sheep and lamb skins. From 70 to 80,000 lamb and sheep skins are annually dressed in the town and its vicinity; upwards of 30,000 pairs of shoes are exported. More than 20,000 yards of flannel, and 10,000 yards of linen, of various qualities, are also manufactured here. There is a good trade with London through the medium of Berwick.

Kilmarnock — has manufactures of Scotch carpeting, serges, woollen cloths, and saddlery. Vast quantities of coarse woollen cloth have been exported from this place to *Hamburgh*, and *Holland*, whence they were, for the most part, during the imperial government in France, sent into Germany, and employed for clothing the army of the *ci-devant* emperor. The manufacture of floor-cloth is also carried on here to considerable extent. In the neighbourhood is an extensive coal-mine, which, by means of water-carriage, recently accomplished, is likely to be of the greatest advantage.

Kirkcaldy — has large manufactures of checks and tickings, and of leather and cotton. The harbour is much improved of late, and there are several vessels belonging to the port. Vast quantities of corn are

exported hence to England, and Holland: several respectable merchants are resident here.

Leith — is the port of Edinburgh, and here most of the merchants, who reside in the latter, have compting-houses and ware-houses. The harbour is formed by the confluence of the water of Leith with the Forth, and is a tide harbour, the water of the river being insufficient. On the north side of the harbour is a convenient quay for the landing of goods, and a wet dock has been constructed within high water-mark, under the auspices of the town council of Edinburgh; but as ships can only enter it at full tide, at other times they lie in Leith roads, about a mile distant, which at all times afford good and safe anchorage for ships of the largest size: in 1781, a fleet of more than 500 sail of merchantmen, under convoy of several ships of the line, remained here several weeks. The commerce of this place is very considerable, and the vessels employed in the London trade are generally of a large size; but those employed in the Greenland fishery are the largest belonging to this port. Leith being conveniently situated for the navigation of the eastern seas, enjoys a share of the Baltic trade. From Russia, Sweden, &c. Leith imports iron in bars, tallow, flax, hemp, tar, &c.; from Holland, flax and linseed; from the Mediterranean, fruits, &c.; from Portugal, wine, fruit, cork-wood, &c. some ships belonging to this port trade to the West Indies, whence they bring the produce of our colonies, rum, sugar, cotton, &c. Several ships are also here fitted out for the whale-fishery in Greenland, and the herring-fishery in the British seas has been very productive. The commerce of Leith is somewhat fluctuating, and dependent on variable circumstances. Considerable quantities of coals are shipped for the north-east coast of Scotland. In 1804, the number of ships that arrived at Leith was 2652. Since the completion of the Carron canal, a navigation has been opened from Glasgow by way of Leith, to the eastern coast of England, as well as to Germany and the Baltic. Ships of considerable size are built here, and several manufactures have been established, connected with ship-building, such as those of ropes and sail-cloth, which are carried on to considerable extent. The principal manufactures, beside these, are soap, leather, and shoes, of which considerable quantities are manufactured both for home use and exportation; and Leith is also particularly celebrated for its glass-works. Here are several flour-mills, a manufactory for carpets, and some large iron foundries.

Montrose — has a commodious harbour, which admits vessels of a large burthen, having wet, and dry, docks, for the building and repairing of ships. There are upwards of 100 vessels belonging to this port, which

are chiefly employed in the coasting and Baltic trades. The principal manufactures are linen yarn, thread, sheeting, and sail-cloth, beside which there is an extensive tannery, and several rope-walks.

Paisley — is now the first manufacturing town in Scotland, and many of the streets, lanes, and alleys, are named from the various branches carried on in each: previously to 1760, the manufactures consisted principally of coarse linens, and handkerchiefs, which were succeeded by those of lawn and gauze, and a sort of thread introduced from Holland. It has been computed, that there were formerly no fewer than 5000 persons employed at one time here in the gauze branch, and as many more as winders, warpers, clippers, &c. in the silk manufacture: at present, the manufacture of silk is trifling, while those of muslin, thread, and cotton, flourish. The thread of this place is of that sort known to merchants by the name of "*ounce thread*," as distinguished from the different kinds prepared at Aberdeen, Dundee, and other places. *See title COTTON*. There are also several tanneries, and manufactories of soap, candles, tape, ribbons, &c. Two of the cotton-mills in the Abbey parish, or New Town, contain 22,572 spindles, and employ nearly 1000 persons; in this district, there are also a calico printing work, several bleach-fields, and a coppers work. About half a mile west of Paisley stands the little village of Maxwelton, at which there are several extensive cotton manufactories.

Perth — is an ancient city, as much distinguished by its honourable origin, as by its recent improvements. It arose from an encampment of Agricola, while the island was under the dominion the Romans. It was a royal burgh in the time of king David I., and its privileges were confirmed by William the Lion. In ancient days it was a royal residence of the kings of Scotland, the seat of their parliaments, and their courts of justice, and esteemed the capital of the kingdom. It is situated on a fine plain, on the west side of the river Tay, by which it communicates with the ocean near Dundee. The tide flows up the river, and reaches about two miles above the town. The river is navigable for sloops, and small craft at all times, and in spring tides for ships of considerable burthen. It has a bridge of ten noble arches, completed towards the end of the last century, at an expense little less than 30,000*l*. On the river are extensive fisheries, and a considerable trade, both of import and export. The manufactures are in a flourishing condition, consisting of linen and cotton goods, boots and shoes, and leather unmanufactured. About five thousand hides, and five hundred dozen of calf skins, are supposed to be annually prepared in the city and its environs. Nor is agriculture in a less flourishing

ing condition than commerce; for the neighbourhood of Perth has long been celebrated for the skill, and the wealth, of the cultivators of its soil.

The population of the city was reckoned at about 20,000, in 1821.

Portpatrick—a great traffic is carried on in the importation of black cattle and horses from Ireland, which has averaged for several years to the number of 11,000 head of cattle, and 2,000 horses. It is the shortest passage between Great Britain and Ireland, and as such is a good deal frequented.

Stirling—has good manufactures of carpeting, shalloons, and other woollen goods; and the cotton trade is in a very flourishing state. Here is a productive salmon fishery, rented by a company, who send the fish to the London and Edinburgh markets.

We shall take leave of Scotland by extracting from the twenty-five articles of the union between that country and England, all that relates to trade, which is comprised in the following words: "The standard of the coins, weights, and measures shall be reduced to those of England; and the laws relating to trade and customs and excise shall also be the same in Scotland as in England."

SWEDEN may be divided into five component parts, viz. Sweden Proper, Gothland, Norland, Lapland, and now Norway. Finland, one of the ancient provinces, was first seized by, and ultimately ceded to, Russia. Sweden is very favourably circumstanced for commerce, being almost surrounded by sea and intersected by rivers. She has numerous ports, and plenty of every material for shipping. The country, however, is far from wealthy, for all the luxuries of life, and many of the comforts being procured from other parts of the world, her exchanges are chiefly made by the barter of raw materials for manufactured articles. In order to check this traffic, certain sumptuary laws have been recently promulgated, but so far from having answered the purpose for which they were designed, they appear rather to have injured the general commerce of the kingdom.

Productions.—The most important are, iron, reputed to be the best in the world, copper, wood, alum, vitriol, &c. but the iron and copper mines, and the wood, form the principal sources of the kingdom's riches, inasmuch as they give rise to the commercial exports which Sweden makes to all nations. Sweden annually exports 7000 schipfuels of alum, as also large quantities of vitriol, brimstone, ochre, and coal. The immense forests, with which this kingdom abounds, furnish planks, beams, joists, laths, tar, pitch, and potash.

Manufactures.—The manufactures of Sweden are not so flourishing as might naturally be expected. The cloth manufac-

tures are the most considerable, of which some furnish a fine description of cloth made from Spanish wool, and large quantities of the coarser sorts made from Polish wool. Stuffs, ribbons, and stockings are also made from silk, brought *via* Hamburg and Holland; but these manufactures are much injured by the importation of foreign silks, with which the former cannot be put in competition. There are some excellent tan-yards at Stockholm and Gottenburgh: where also are manufactured linen, sail-cloth, and paper; but not sufficient for the consumption of the country. Sweden refines all her sugar. There are some other species of industry in this kingdom, such as snuff manufactories, salt, brass, and starch-works, which contribute little to the external commerce of the kingdom. Excellent gunpowder is likewise made here.

Commerce.—The export trade is divided into two branches; iron constitutes the first. Large quantities of this metal are purchased by the English, who cannot dispense with it in their steel-works, and, therefore, form lasting contracts with the proprietors of the mines; tin, wire, nails, anchors, and cannons, form the chief part of this traffic. Wood in planks of various degrees of thickness form the second branch, which is likewise considerable, and includes the export of pitch, tar, pot, and other, ashes. The imports are generally carried on by Swedish vessels, which convey the above-mentioned commodities to foreign ports, and in return bring home grain from Prussia, Poland, and Livonia; salt from Sardinia, Portugal, Spain, and France; wines from France, the Rhine, and Portugal; and brandies from Spain, Portugal, and France. To these may be added, the manufactures of England, the wools of Spain, Poland, and other countries, flax, hemp, cotton, skins, salted provisions, spices, &c. &c. The Swedish East India Company has an exclusive privilege, and imports all the oriental commodities consumed in Sweden. There is in Sweden a certain number of towns called *staple towns*, which participate more or less in the external commerce of the kingdom. From them a considerable trade is carried on, in all sorts of bar-iron, bells, plate-iron, copper, iron cannons, pitch, tar, alum, and deal planks: there is also a considerable manufactory of brass-wire, and there are besides several yards for ship-building. Helsinfors exports grain, iron, planks, pitch, and salt-fish; and has a manufactory of linen cloth, of pipes, snuff, ropes, besides a yard for ship-building.

Stralsund is the chief city of Swedish Pomerania, and its trade consists in the exportation of grain, the product of the duchy and island of Rugen; of malt, wheat, rye, oats, pease, some coarse wool, wax, and a few other articles.

Gottenburgh exports, besides the articles mentioned under the head of the commerce of Sweden, in general, herrings, and oil of herrings and whales, sail-cloth, &c. The ships belonging to the Swedish East India Company are fitted out at this port, which sends Indian produce not only to the different ports of Sweden, but even to foreign countries.

The import trade of this country being small, it is usual for ship-owners here to send a cargo of iron, tar, pitch, &c. to England, and let the ship there take a charter to the Mediterranean, Spain, or America, which often pays in one voyage for the loss of the vessel.

Accounts in Sweden are kept in rix-dollars, each rix-dollar consisting of 48 skillings, and each skilling of 12 oeres or pfenings.

SWITZERLAND consists now of 22 cantons, each having its own independent government and laws, forming collectively the Helvetic Confederation. These cantons are, Zurich, Berne, Lucerne, Uri, Schweiz, Unterwalden, Glarus, Zug, Friberg, Soleure, Basle, Schaffhausen, Appenzell, St. Gallen, the Grisons, Argovra, Turgovia, Tessino, Vaud, Vallais, Neuchatel, and Geneva. The general situation of Switzerland with respect to Germany, France, and Italy, as well as the easy conveyance of goods on the rivers Rhine, Rhone, and Aar, greatly facilitates the trade with these countries and Holland.

Productions.—The soil of Switzerland is very various; it is neither so fertile as the plains of Italy, nor so sterile as the northern parts of France. The productions are, corn, rye, barley, and other sorts of grain. The trees produce all sorts of fruits, with the exception of those which are peculiar to warm countries, such as dates, oranges, lemons, &c. Switzerland also produces flax, wool, and wine; as well as butter and cheese of excellent quality. The cantons of Lucerne, Uri, Schweiz, Unterwalden, Zug, Glarus, and Appenzell, do not grow a sufficient quantity of corn for their own consumption: nay, even in some parts of these cantons there is not a single ear of corn to be seen. On this account the Swiss are obliged to purchase grain of their neighbours, and to store it up in their towns in case of scarcity. This country produces several sorts of wine, two of which are both wholesome and agreeable; the one is white, and grows upon the borders of the Lake of Geneva, on which account it is denominated *de la cote Wine*; the other is red, and is grown not only in the county of Neuchatel, but also in the canton of Berne. Wines are also made in the cantons of Zurich, Schaffhausen, &c. which the inhabitants consume. Switzerland possesses such a vast number of beasts, that the Swiss are enabled to supply their neighbours; they

are very good of their different kinds, and form an exceedingly lucrative branch of commerce. In the mountains are made butter and cheese, which not only serve the inhabitants, but are likewise exported in vast quantities to Italy and France. There are upon the mountains, as well as in the plains, woods of pines, firs, oaks, beech, and a few elms.

Zurich is the first city of Switzerland, and has an extensive trade with Italy and the Netherlands. It is situated on the lake of the same name, which has a communication by means of inferior rivers with the Rhine.

Basle has the greatest commerce of any city in Switzerland, as all goods from Germany, Holland, &c. must pass through this place.

Geneva is situated on the river Rhone and the lake of Geneva, and is a place of great celebrity for not a few kinds of traffic. They excel here in making all sorts of time-pieces, and are great speculators in insurances and mercantile transactions, at the ports of the neighbouring states of France and Belgium.

Manufactures.—The general manufactures of Switzerland are muslins, cottons, painted linens, open worked table-cloths, of all sizes, prices, qualities, and descriptions; linens for shirtings, called *Rouen, Bern, or Coutance*; dimities plain, corded, and striped; *Cambrays*, light stuffs of silk, and of cotton and silk, painted silks, silk neck-handkerchiefs, woollen and cotton stockings, large quantities of which pass into Italy and Alsace; silken ribbons, which are sent into Germany and Spain; silk handkerchiefs worked in squares, coloured and plain; brass and iron wire, clock and watch work, dyeing, &c. &c.

Commerce.—The chief articles of the Swiss export trade are their oxen, kine, butter, and cheese, and (latterly) their horses. The cattle are for the most part sold in Italy, whither they are sent in thousands. The Grisons' country and that of Vallais supply the greatest number. The Italians buy them for the purposes of feeding them in their pastures of Milan and Bergamo, and afterwards slaughtering the oxen and procuring milk, butter, &c. from the kine. As to the cheese, their excellent quality is too well known to need any comment; they yield a liberal profit to the Swiss. The canton of Friberg, in which is situated the territory of Gruyere, possesses the chief trade in this article. A great deal is sent into France. At Lyons there are houses established, who trade in this article alone. Hides and leather form a considerable branch of commerce: there are some excellent tan-yards at Berne and at Basle. The canton of Berne exports large quantities of calf-skins for Italy. Goat-skins are prepared at Basle, whence great numbers are sent into Germany. Formerly skins were

sent from Switzerland to England, but of late none have been purchased by the English. The commerce in flax and hemp is small. Very little Swiss wine is exported. There are some iron mines in Switzerland, and the country of Basle possesses forges in which the ore is manufactured into various household, and other, articles. The Swiss, as we have already observed, are oftentimes in want of corn, and the people of Geneva have frequently been obliged to procure large quantities from England, by way of Marseilles. They are not better furnished with salt. The canton of Berne possesses a salt-work, but its produce barely serves to answer the demands of the canton itself. The Swiss export some cherry-brandy; and send the Alpine game even to Paris: they also have a small traffic in fresh-water fish, prunes, medicinal herbs, and some marble, the quarries that produce which are situated in Vaud. The clock-work, toys, and gilt articles of Geneva, pass into Italy, Spain, Germany, the ports of the Levant, and America. From Basle is sent a great deal of fine writing-paper, denominated *The arms of Basle paper*. Silks, cottons, &c. are likewise a part of the Swiss exports. Woollen and cotton stockings pass into Italy. The Swiss obtain their hats from Lyons. The other imports of Switzerland are, spices, sugar, and coffee. A great part of the last is brought from the islands of Bourbon and Martinique, through France. From Holland they draw pepper, nutmegs, cinnamon; from England and the Low Countries, cloths. The fairs of Frankfort and Strasburg, which they frequent, give them an opportunity of selling their own commodities, and of purchasing those of Germany. From France they draw wines, corn, flax, salt, linseed oil, vegetables, Provence oil, Marseilles soap, saffron, honey, almonds, olives, prunes, capers, wool, tobacco, &c. &c.

Accounts are kept at Geneva, and through all the cantons, in current livres, each livre consisting of 20 sols, and each sol of 12 deniers.

TURKEY. The grand seignior, or sovereign of this country, with great propriety, so far as respects locality, styles himself "Lord of the Black, White, and Red Seas." Of Constantinople, the capital, some notice has been taken under title ASIA. What remains to be said of this empire, which is partly European, must refer rather to the trade of the sea-coast in its vicinity, the Morea, and the Levant, than to the territorial possessions of the sovereign. To enumerate all the articles of commerce in the Morea, or the places where they may be obtained, would be to exceed our limits; it is sufficient to observe that currants, oil, dye-woods, and cotton, are to be purchased on advantageous terms; and that at the safe

and convenient port of Modon or Modona, and that of Petesso, they may always be shipped with ease and safety. All articles here are most advantageously purchased with specie, but lead, tin, pewter, salt-fish, spices, arms, &c. in small quantities, find a market.

The happy situation of Constantinople on its secure and convenient port, would render it a place of extraordinary commerce, if the inhabitants were secure from being plundered of their property by the government, and foreigners were free from exaction and insult. Under all these disadvantages, however, there are some nations with which the Turks traffic, the Italians, the Dutch, English, and French. The Italians, but the Venetians in particular, carry to Turkey cloths, white-lead, quicksilver, sublimate, opium, mercery, and German hardware, glass-beads, enamel, mirrors, silk stuffs, gold and silver, vitriol, iron, and brass-wire, paper, &c. &c. and in return receive the same sorts of merchandise as the French and English. The Dutch and English, of whom the latter are preferred, carry thither coarse and fine cloths, pepper, cloves, nutmegs, ginger, pewter, gunpowder, arms, red, white, and salted herrings, pilchards, dried cod, refined sugar, tobacco, &c. &c. The returns are cotton-wool, spun cotton, silk, wool, goats' hair, cottons, wax, skins, leather, oil, madder, coffee of the finest quality, gums, morocco-skins, shagreen, sponge, mastich, saffron, galbanum, galls, ashes, box, aniseed, carpets, several sorts of silk, Valonia soap, diamonds, rubies, pearls, &c. The French receive similar commodities, and in exchange supply the Turks with silken stuffs, paper, watches, toys, ironmongery, mercery, syrups, liquors, sugar, coffee, indigo, cochineal, spices, drugs, lead, and pewter. A very considerable trade is now carried on between Turkey and Russia, and strange to say, in confirmation of all that has been observed respecting the vicissitude of human affairs, principally through those very ports which have been ravished from Turkey by her more enterprising neighbour. Asoph, Cherson, Odessa, Taganrog, and Theodosia, are the ports with which Turkish traffic is carried on, and of these Odessa is the favourite, being declared a free port, and generally open all the winter.

Accounts are kept in Turkey in piastres, each piastre being divided into 40 paras, 80 great aspers, or 120 aspers.

ISLANDS OF EUROPE. — Under this head we propose to give a sketch of the several species of commerce carried on by such islands as depend upon the different kingdoms and states treated of in the foregoing part of the present article; but which were not considered of sufficient importance to demand separate heads, or those details relative to productions, manufactures, commerce,

&c. bestowed upon the continental and important insular divisions of Europe. The islands are arranged in geographical order.

Aland, — a Swedish island, furnishes Stockholm with abundance of wood for fuel and carpenters' use, as well as with considerable quantities of fish.

Archipelago, Islands of. — These islands are situate in the Egean or Grecian sea, and were denominated Cyclades and Sporades by the ancients. Of some of these we have spoken separately, such as Zante, Cephalonia, and Corfu; in this place we can only give a sketch of the general features of the commerce and commodities of the islands in question; those of the Archipelago are 78 in number, most of them uninhabited; several contain only a few mean habitations of poor labourers and their families, and all of them discover but very imperfect remains of the grandeur attributed to them in ancient times. Their population has never been correctly ascertained, but it is generally supposed not to exceed 3000 souls. The productions of the whole are alike; the greater part is sent to the Levant, and thence disseminated throughout Europe; they consist of wheat, barley, oats, and every species of grain; wine, oil, honey, wax, olives, figs, and other kinds of fruit; silk, wool, cotton, gum, marble, emery, load-stone, and medicinal plants. Most of these islands are rich in cattle, game, and their shores in fish; and some of them possess salt-mines, veins of sulphur, alum-stone, and even gold. If industry were as active here as the soil is rich, and the earth productive, they would no doubt attain the very pinnacle of commercial grandeur and prosperity. The whole employment of the inhabitants, however, consists in making some species of silken goods, such as damasks, velvets, &c. and in the manufacture of a few linens, cottons, and woollens, which are never exported, being barely sufficient for home consumption.

Bornholm. — This is a Danish island, and its commerce is certainly in a more advanced state than that of any other Danish possession in the Baltic: there are large manufactures of coarse woollen goods here, the raw material consumed in which, is produced by the immense flocks of fine sheep bred in the island. A great deal of butter is exported hence, besides salmon, herring, and cod-fish, which, but especially the former, are taken in abundance in the rivers, and on the coasts of Bornholm. Very fine quarries of stone are worked in two or three places, and coal, scarcely inferior to the English, is very plentiful; several species of clay, fit for the manufacture of earthenware, but particularly a very excellent sort, of which the inhabitants make a tolerably good kind of porcelain, are found in this island: the exportation of this clay is prohibited. Bornholm likewise produces globular stones,

which contain that species of crystals called *Bornholm-diamonds*.

Candia, — an island in the Mediterranean, known to the ancients under the name of Crete. This island is extremely fertile, and the air is here very pure. Psiloriti, or Mount Ida, is situated in the middle of Candia, and is, properly speaking, nothing more than a rock; during the best part of the year its summit is crowned with snow, and it produces only the tragacanth shrub, (*astragalus tragacantha*), a species of buckthorn, which yields by incision gum tragacanth. The valleys and plains abound in grain of every sort, in medicinal plants and drugs, wine, mulberry-trees, and olives: although the wheat grown here is of the finest kind, the inhabitants make very indifferent bread. The export of grain is frequently prohibited. Candia furnishes abundance of silk, but the inhabitants prepare it so wretchedly, that the Christian nations purchase very little of it; procuring the finest silks at Smyrna, and other ports of the Levant. The wool of Candia is only fit for the manufacture of coarse goods. The oils which the island produces are chiefly consumed by the French soap-boilers. Candia boasts a prodigious variety of trees, as well such as grow in Asia, as those which are common in Europe; of these the principal are the cypress, pine, oak, willow, carob-bean, arbut, palm, fig, olive, almond, wild pear, plantain, laurel (which the Greeks call *daphne*), myrtle, walnut, chesnut, the *asphetamos* (a tree resembling the maple), and the *iprim*, which is a kind of *phlirea*. The island also produces 72 sorts of grapes, and a great variety of shrubs, not to be found in any other part of the Levant. Near the village of Eskinpi, at the foot of Mount Ida, are mines of silver, lead, copper, iron, and alum-stone, which every person is at liberty to work, on the condition of paying one-fifth of what he draws from the mines to the governor of the island. The commerce of Candia is very considerable; most of the nations which trade to the Levant have consuls here. The island supplies vessels touching at it with fresh provisions, and exports the productions of its soil and industry to England, France, Italy, and the ports of the Levant, receiving in return the commodities of those states. The English and French consuls reside at Canea, a town and port of this island; the other trading towns of Candia are Retimo, Candia, and Gira Petra.

Cephalonia. — The chief production of this island, which is situated near Zante, is currants, similar to the produce of the latter. Cephalonia is likewise fertile in olives and in vines, but especially in that species of vine called by the French *muscat rouge*, or red muscadine. The merchants of Zante purchase all the currants produced in Cephalonia, and hence this island has no com-

merce of its own, in a direct way, even with Italy. Cephalonia or Argostoli is the principal port. *See Zante.*

Corfu. — an island of the Ionian Sea. It is fertile in vines, olives, cedars, lemons, &c. but it produces neither corn nor cattle. Vast quantities of salt are found here. This island trades with Greece and Italy, and procures the principal part of its corn from Epirus. These three islands formed a part of the dominions of Ulysses, so famous in the poems of Homer. *See Zante.*

Corsica. — The territory of Corsica is fertile, and even the soil of the mountains, except those which are highest, and covered the greater part of the year with snow, repays the toils of the cultivator. This island produces wheat, rye, barley, but no oats; so that the horses and mules are fed with barley. Agriculture is not in the most prosperous state in Corsica; the implements of husbandry are generally clumsy and ill made; nor are the Corsicans considered able or industrious agriculturists. Several parts of the island produce excellent wines, which are, however, said to be extremely heady. At Capo Corso two sorts of wine are made, one of which much resembles Malaga; large quantities of this wine are annually sent to Germany, and there sold under the name of Malaga; the English purchase considerably of this wine at Leghorn, and much of it is sold throughout Great Britain as Spanish wine; the other species of white wine of Capo Corso is somewhat similar to Frontinac. Furiani furnishes a kind of white wine, whose flavour comes very near that of Syracusan wine, only that it is not so sweet. In several villages they make a pleasant white wine, nearly resembling Tokay; and at Vescovato and Campotoro a very fine red wine, which partakes of the flavour of Burgundy, is to be met with. Corsica exports some grapes, and large quantities of raisins. The olive flourishes here, and of the oil, which the olive plantations yield, about 2,500,000 lbs. are annually exported. The lemon tree, the pomegranate, the orange, the almond, and the mulberry-tree, all thrive in Corsica; and chesnuts are in such abundance, that according to Boswell, 100,000 crowns' worth are annually exported; flax of good quality is likewise plentiful; very little silk is gathered in this island, but the forests furnish excellent timber, especially pines, box, chesnut, and arbutus. The island of Corsica abounds in wild, and domestic, animals of various species: the horses are of a very small race, as are the asses and mules, but their vigour and strength compensate for their diminutiveness; the beeves and kine are numerous, but the former are very lean, and the latter afford very little milk; scarcely any butter is used here, oil being its substitute; but a tolerably good sort of cheese is made in some parts of the island. The sheep are

generally fat, their flesh extremely sweet, and their wool (notwithstanding the native breeds being crossed by the English and Spanish races) uncommonly coarse and wiry. The mountains of Corsica produce lead, copper, silver, alum, granite, porphyry, and jasper. Salt and saltpetre are made in several parts of the island. Near San Fiorenzo there is a silver-mine, whose ore yields 5 lbs. of silver per quintal. The Corsican iron is highly esteemed. The rivers of Corsica, as well as the lakes, produce excellent fish in great abundance; and the coasts swarm with sturgeon or tunny, sardines of peculiarly fine flavour, and large oysters, of which, as well as tunny, considerable quantities are exported. Three beautiful species of coral, namely, red, white, and black, are found on the coast facing Sardinia. Manufactures are not in a flourishing state in Corsica: some coarse woollens are made from the wool of the Corsican sheep, and for this purpose the black wool is generally employed, the white or grey being in no sort of repute. The inhabitants make their shoes of the untanned skins of hogs; they are not unacquainted with the art of tanning, and as they send the greater part of their bark to Italy, generally perform the process with the leaves of the wild laurel, dried in the sun and reduced to powder; this ingredient communicates a greenish shade to the leather. Very little linen is made here, and notwithstanding the fineness of the flax, what is manufactured usually proves very coarse. The commerce of Corsica is trifling, and is, for the most part, carried on with France and Italy, consisting in an interchange of commodities. The principal ports of this island are Centuri, San Fiorenzo, Isola Rossa, Calvo, Ajaccio, Bonifacio, Porto Vecchio, and Macciano. Porto Vecchio, situated on the eastern side of the island, is the best.

Cyprus. — This is one of the largest islands in the Mediterranean. The climate of Cyprus is not so temperate as that of other islands lying in the same degree of latitude. The winds blowing from the high mountains render the island extremely cold, more especially on the north side. Two species of commodities sustain and invigorate the commerce of Cyprus: the first is the productions of the island itself; the second, the merchandise which it procures from the circumjacent parts of Caramania. With respect to the first, the cotton which Cyprus produces, is esteemed, on account of its extraordinary whiteness, superior to any other of Levantine growth; it is uncommonly soft, and its filaments long and fine. It is generally sent to Venice, whence it finds its way into the German, English, and Dutch markets. Silk is an important object of Cyprian commerce, and large quantities are gathered in the island, during the month of May, and the succeeding warm months; the

silk is of different colours, and qualities, according to the parts of the island in which it is produced: the white silk is the most esteemed, but beside this there are yellow, orange, and bright gold-coloured silks; the English, Dutch, and French, purchase the greater part of the white and yellow silks, the Italians import all sorts, and the Turks mostly buy the orange-coloured silks. Cyprus produces three sorts of wool, namely white, brown, and black, of which the first is most esteemed; the shearing commences on the 20th of March, each year, and the sale takes place in the month of August. Entire fields are here covered with the cassia plant, which grows spontaneously; the gathering takes place in the month of May, and large quantities are exported to Ham-burgh, Amsterdam, Marseilles, and Venice. Madder grows spontaneously in this island, but as the demand for this dye stuff is very great, the inhabitants are obliged to sow large quantities of seed annually; much of this root is sent to the Levant, and to France. Small quantities of cochineal are annually gathered here and sent to Venice. Near the village of Calopsidare the kali plant is grown; it is burned during the summer months, and the ashes are exported to France and Italy in September and October. Turpentine of excellent quality is obtained here both by incision, and pressure, and is exported to many parts of the world, but especially to Venice, where it is in high repute. Large cargoes of corn are annually sent to Leghorn, Genoa, Marseilles, and Malta; for Cyprus produces a much greater quantity of corn than serves to supply its domestic demand for this article. The wines of Cyprus are all of excellent quality; but that which is called Commandery is the most esteemed throughout Europe: the whole of the annual produce of the vineyards amounts to 10,000 barrels; these wines are mostly bought up by the French, the Dutch, the English, and the Tuscans. Salt, which is a natural production of the island, is exported to Syria and Constantinople. There are four other valuable productions of Cyprus, viz. carob-bean, tar, pitch, and planks. The Turks and the Greeks purchase the greater part of the carobs, which are carried to the Levant by the European vessels; the destination of the remaining articles is the same. Such are the natural productions of Cyprus: those commodities with which Caramania supplies the island, are styrax, both liquid and resinous: camels' hair, gall-nuts, and many other Turkish goods, which are re-exported to different parts of Europe. The imports of Cyprus, from the other parts of Europe, principally consist of silks, woollens, indigo, hardware, &c. &c.

Guernsey.—The harbour of St. Peter's, or Saint Pierre, the capital of this island, is very safe and commodious, and at each side of it

are strong piers. The air here is very healthy, and the soil fertile, but the inhabitants neglect agriculture, for the sake of trade and commerce. In time of peace, Guernsey carries on a considerable traffic with France, and other parts of Europe; and at all periods, it, as well as the neighbouring islands of Jersey, Alderney, and Sark, is a *depot* in which the wine merchants of London and other parts of England lodge their wines, until they find a demand for them, in order to avoid being in advance for duties inwards. In time of war a great number of privateers are fitted out here, and bring considerable riches to this place. The island is full of gardens and orchards, and the principal beverage of the inhabitants is cider. Here is found that useful species of stone called emery or smyris, which is used by jewellers in polishing precious stones, and by glass cutters in the performance of their occupation. The only manufactory of any consequence is that of stockings.

Hebrides, or Western Isles.—The soil varies in the different islands which come under this denomination; some are mountainous and barren, producing little else than heath, wild myrtle, fern, and a little grass; whilst others, being cultivated and manured with sea-weed, yield plentiful crops of oats and barley. Lead-mines have been discovered in some of the islands, but they have not been worked to much advantage; others have been found to contain quarries of marble, lime-stone, and free-stone; nor are these islands destitute of iron, talc, crystals, and many curious pebbles, some of which emulate the Brazilian topaz. The commodities which may be deemed the staples of this country are black cattle, sheep, and fish, which are mostly sold to the Scotch; part of the wool is worked up into knit stockings, coarse cloth, and that variegated stuff called *tartan*. Cod, ling, mackarel, whiting, haddock, and soles, are caught in abundance; a prodigious quantity of herrings are also caught here and cured. The commerce of these islands is very capable of being advantageously extended.

Iceland.—The principal commodities which this island exports, are dried fish, such as cod, herrings, &c. salted mutton, a small quantity of cured beef, butter, fish-oil, tallow, woollen stuffs of the coarsest kind, especially that called *wadmel*; under waistcoats made of wool; gloves and stockings, composed of the same material; raw wool; sheep, and lamb, skins; fox-skins of different colours; eider-down and feathers. Sulphur was formerly procured from Iceland, but none is now exported. The imports chiefly consist of spirits, wine, salt, cloths, linen, iron, copper, medicinal drugs, dye-stuffs, wood for building, &c. fishing-hooks and lines, tobacco, corn, and horse-shoes. This commerce is vested in the hands of a com-

pany, the members whereof are all Danes. The Icelanders barter their own commodities for the greater part of their imports, and pay the amount of the remainder in money. Although the Iceland company has the exclusive privilege of carrying on the trade of the island, private individuals may have a participation in it, on application to any of the members, and by the payment of a moderate duty or fee; the company sends from 18 to 20 vessels, annually, from Denmark to Iceland, of which 14 are fitted out at Copenhagen, and the others at Gluckstadt. The Danish coins, weights, and measures, are current in, and are the standard of, Iceland.

Jersey. — The middle of this island is mountainous, and so thick with orchards of apple-trees, that it resembles a forest. It has been computed that 25,000 hogsheads of cider have been made here in one year, inasmuch as to occasion a deficiency of arable land for corn, which is imported from the Baltic, England, and in time of peace from France. It produces plenty of cattle, particularly sheep; the wool is manufactured into stockings and caps, of which some thousands are every week sold at the market of St. Helier. The merchants employ several ships in the Newfoundland fishery, as well as in the English, French, Spanish, Portuguese, and American trades. The coasts abound with fine fish, amongst which there are some species rarely to be met with in the British seas, such as the *grounard*, the *ormer*, &c. The isles of *Alderney* and *Sark* are noted for their breeds of small black cattle, the flesh of which is of a delicious flavour. These islands are extremely fertile; their commerce is similar to that of Jersey, though on a less extensive scale; the only manufacture is that of stockings.

Lipari Islands. — These islands, which belong to Sicily, are in number eleven, and are situated to the north of the last mentioned island; the largest of them is called Lipari, and it is eleven leagues in length: several of the Lipari are desert, but others abound in alum-stone, currants, grain, cotton, and sulphur; the veins of which latter are visible on the surface of the soil. The Malmsey wine which the islands of Lipari produce is excellent, and the greater part of the inhabitants are extremely industrious, besides being skilful navigators. The trade of the Lipari islands is almost exclusively carried on with Sicily.

Majorca. — a large island in the Mediterranean; it is fertile in corn, wine, and olives. A great deal of coral is found on the coasts, and the inhabitants are accounted good seamen. The city of Majorca, or, as it is frequently denominated, Palma, is well fortified, beautiful, large, and rich. This city has some flourishing manufactures of silks and woollens.

Malta. — This island is a mere rock, covered with a soil not more than five or six inches in depth. The industry of the inhabitants has, however, overcome what to some nations would appear an insuperable obstacle to cultivation, and the shallow soil of Malta is, in a manner, forced to support its cultivators, and even to bring wealth to the island. Since it has been in possession of the English, viz. 1817, it has been permitted by statute to trade both directly and circuitously with Gibraltar, the Cape of Good Hope, and all the places within the India Company's charter, except China. Malta produces a very small quantity of grain, indeed so little, that the annual crop is barely sufficient to supply the inhabitants with five months' provision. This island produces very excellent cotton, of which it exports to the annual value of 400,000 ecus. The Maltese oranges are in high repute, and the yearly produce of this fruit is extremely abundant. Cummin is likewise grown here in large quantities. The commerce of Malta is in a flourishing state: this commerce is not alone supported by the territorial productions of the island, but likewise by the number of English, Dutch, French, and Italian vessels which touch here, and supply the place with various kinds of merchandise, and by the Maltese merchants freighting vessels with goods for the Italian ports, in order to obtain returns for grain, &c. In addition to the commodities already specified, Malta furnishes fresh provisions, figs, melons, raisins, and grapes, which latter are esteemed equal to those of any other part of the world: it is to be observed that these grapes do not yield any species of wine. In this island many articles are manufactured from the cotton, the produce of the country, but especially stockings, which are accounted very beautiful and durable. The Maltese cotton coverlids, and such like goods, are in high repute throughout Europe. The inhabitants of the little isle of Gozzo, which belongs to Malta, are industrious in these branches of manufacture, and cultivate the sugar-cane with success.

Man, Isle of. — The herring-fishery is the most important occupation of the Manks; it employs about 5000 of the men, the women being mostly employed in husbandry. The sheep here are small and hardy, and their flesh is excellent; a peculiar breed, called Laughton, of which the fleece is in the greatest repute among the inhabitants for cloth and stockings, is of the colour of Spanish snuff. There is a light-house and a custom-house in this island. The exports to Great Britain are potatoes, butter, eggs, pork, beef, skins, kelp, honey, wool, linen, yarn, and lead-ore. This island is much infested by smugglers, and serves this description of persons as a ready medium

whereby to introduce contraband goods, at convenient periods, into England and Ireland.

Minorca. — This island is situated in the Mediterranean, and belongs to Spain. The inhabitants are extremely ignorant, but industrious; they cultivate olives and vines, yet are not capable of making wines. They import the greater part of the corn which they consume. Pearl-ashes are prepared here, but their quality is inferior to that of the ashes exported from Trieste. Saffron, cotton, and tobacco, thrive in this island, and large quantities of salt are annually exported hence; besides marble, wax, honey, and olives. The inhabitants have long carried on a lucrative trade by importing considerable cargoes of fine wool, from the coast of Barbary, spinning it, and afterwards disposing of it to the Spanish and French merchants. Large quantities of tunny are salted in Minorca, and there are very productive fisheries on the coasts. An extensive manufactory of cordage is established in the island, the produce of which is sent to the adjacent ports in the Mediterranean. Minorca is a considerable loser by its external commerce, its annual imports amounting to nearly 56,700*l.* and the value of exports being not more than 20,120*l.*

Oeland. — Vast quantities of black cattle are pastured in this island, which belongs to Sweden, and is situated on the Baltic; it likewise abounds with stout little horses, and exports a great deal of honey, wax, nuts, kid-skins, alum-stone, (of which there are entire mountains here,) a fine durable stone used for building with, hones, black marble, grey ditto, and divers species of petrifications.
